The *two-light frame* may be seven feet long, four and a half wide, and fifteen or eighteen inches high in the back, with bars reaching from it at top to the front, serving both to strengthen the frame and help to support the lights; the two lights to be each three feet six inches wide, made to fit the top of the frame exactly.

The *three-light frame* should be ten feet six inches long, four and a half wide, and from eighteen inches to two feet high in the back, and from nine to twelve or fifteen inches in front—observing that those designed principally for the culture of melons may be rather deeper than for cucumbers, because they generally require a greater depth of mould or earth on the beds; though frames, eighteen or twenty inches in the back, and from nine to twelve in front, are often made to serve occasionally both for cucumbers and melons. Each frame should have two cross bars, ranging from the top of the back to that of the front, at three feet six inches distance, to strengthen the frame, and support the lights; and the three lights should be each three feet six inches wide; the whole together being made to fit the top of the frame exactly, every way in length and width.

Sometimes the above sort of frames are made of larger dimensions than before specified; but in respect to this it should be observed, that if larger they are very inconvenient to move to different parts where they may be occasionally wanted, and require more heat to warm the internal air; and in respect to depth particularly, if they are but just deep enough to contain a due depth of mould, and for the plants to have moderate room to grow, they will be better than if deeper, as the plants will be then always near the glasses, which is an essential consideration in early

work, and the internal air will be more effectually supported in a due temperature of warmth; for the deeper the frame, the less in proportion will be the heat of the internal air, and the plants being far from the glasses will be some disadvantage in their early growth. Besides, a too deep frame, both in early and late work, is apt to draw the plants up weakly; for they always naturally aspire towards the glasses, and the more space there is, the more they will run up; for which reason the London kitchen-gardeners have many of their frames not more than fourteen or fifteen inches high behind, and seven in front; especially those which are intended to winter the more tender young plants, such as cauliflower and lettuce, and for raising early small salad, herbs, radishes, etc.

The wood-work of the back, ends, and front should be of inch or inch and a quarter deal, as before observed, which should be all neatly planed even and smooth on both sides; and the joints, in framing them together, should be so close that no wet or air can enter. The cross-bars or bearers at top, for the support of the glasses, should be about three inches broad and one thick, and neatly dovetailed in at back and front even with both edges, that the lights may shut down close, each having a groove or channel along the middle to conduct off all wet falling between the lights. At the end of each frame, at top, should be a thin slip of board, four inches broad, up to the outside of the lights, being necessary to guard against cutting winds rushing in at that part immediately upon the plants, when the lights are occasionally tilted behind for the necessary admission of fresh air, etc.

With respect to the lights, the wood-work of the frame should be one inch and a half thick and two and a half broad; and the bars for the immediate support of the glass-work should be about an inch broad, and not more than an inch and a half thick; for, if too broad and thick, they would intercept the rays of the sun, so should be only just sufficient to support the lights, and be ranged from the back part to the front, nine or twelve inches asunder.

All the wood-work, both of the frames and lights, should be painted, to preserve them from decay. A lead colour will be the most eligible; and if done three times over, outside and in, will preserve the wood exceedingly well from the injuries of weather, and from the moisture of the earth and dung.

Mr. Knight has suggested an impor-

tant improvement in the form of frames. He observes, that the general practice is to make the surface of the bed perfectly horizontal, and to give an inclination to the glass. That side of the frame which is to stand towards the north is made nearly as deep again as its opposite; so that if the mould is placed of an equal depth (as it ought to be) over the whole bed, the plants are too far from the glass at one end of the frame, and too near at the other. To remove this inconvenience, he points out the mode of forming the bed on an inclined plane; and the frame formed with sides of equal depth, and so put together as to continue perpendicular when on the bed, as represented in the accompanying sketch.

There are several minor points in the construction of frames that deserve attention. The strips of lead or wood that sustain the panes of glass should run across the frame, and not lengthwise; they then neither obstruct so much the entrance of light, nor the passing off of rain. The inside of the frame should be painted white, since plants generally suffer in them for want of light: if the accumulation of heat was required, the colour should be black.

Raising the Frames.—It is a well-known difficulty that the gardener has in raising the frames so as to keep the foliage of the plants within them at a

determined and constant distance from the glass. To remedy this, Mr. Nairn, gardener to J. Cresswell, Esq., of Battersea Priory, has introduced the ingenious contrivance represented in the accom-

panying sketch and references:—A, a movable frame; B B, inside lining of the pit; C C, outer wall. Between these the sides of the frame pass, and are lowered or elevated by racks and spindles, D D.

A more simple plan might perhaps be adopted, by having frames of the same length and breadth as the original, but only from an inch to three inches, or upwards, deep. These, as necessary, might be put on the top, and would be kept close by the pressure of the lights; bolts and nuts might also be easily applied, and the interstices rendered still more impervious to air by being faced with list.

Glass and Glazing.—See **Stove**.

Shelter for the Glass.—In proportion to the number of lights, matting for shading and sheltering must be at hand. The usual mode of covering at night is by laying on mats, and over these litter, in thickness according to the severity of the season. Some gardeners lay hay immediately in contact with the glass, and over this the mats. Every person conversant with these modes of shelter is aware of their inconvenience. In rainy weather they soon become wet, and rapidly chill the beds; added to which, the trouble caused in placing and removing them, and the danger to the glass from the stones laid on as a resistance to the wind, are by no means inconsiderable.

Mr. Seton, to obviate these inconveniences, employs a particular covering, which he constructs of four laths, two of such a length as to exceed a little that of the frame, and the others in a similar manner that of its breadth. These are bound together at right angles, so as to form a parallelogram of the form and size of the frame; and pieces are bound across this at a foot apart from each other. Over this a mat is spread, and over the mat a layer of straw is fastened, laid on level like thatch, from three to six inches thick, as may appear necessary. If the breadth of the frame is, or exceeds, four feet, it is best to have the covering in two parts, otherwise it becomes weak and unwieldy. These panels, as they may be called, Mr. Seton also employs in preserving tender plants through the winter. A pit of frames, earthed up all round, and covered with one of them, or two or three if needful, is completely impervious to frost.

Substitutes for Glass.—Oiled paper was formerly employed; but this has been superseded by linen dressed with Whitney's or Tanner's compositions; or

the gardener may employ the following preparation:—Old pale linseed-oil, three pints; sugar of lead (acetate of lead), one ounce; white resin, four ounces. Grind the acetate with a little of the oil, then add the rest and the resin. Incorporate thoroughly in a large iron pot over a gentle fire; and, with a large brush, apply hot to a fine calico stretched loosely previously, by means of tacks, upon the frame. On the following day it is fit for use, and may be either done over a second time, or tacked on tightly to remain.—*Gardeners' Chronicle*.

The quantity made according to this recipe will be sufficient for about 100 square feet of calico.

Franciscia. A synonym of **Darwinia**.

Franco'a. (Named after *F. Franco*, a Spaniard. Nat. ord., *Saxifragaceae*; Tribe, *Francoeae*.)

Hardy herbaceous perennials, natives of Chili, and impatient of wet under cultivation. A few plants should be kept in cold frames, to replace such as die off during severe winters. Seeds in a slight hotbed, in spring; plants hardened off, and then transplanted; dry, sandy loam suits them best. In severe weather, they are worth the labour of sticking a few evergreen boughs round them.

Frankincense. *Pinus taeda*.

Franseria. (After *Ant. Franser*, a Spanish botanist and doctor. Nat. ord., *Compositæ*.)

Half-hardy herbaceous biennial or perennial seeds, sandy loam.

F. artemisioides. 5-6. Chilian Andes. 1890.

Fraseria. (Named after *John Fraser*, botanical collector in North America. Nat. ord., *Gentianæ*; Tribe, *Swerticeæ*. Allied to *Gentiana*.)

Hardy biennial marsh-plant. Seeds in spring, and transplanted; also by division of the roots; sandy peat, with a little turfy loam.

F. carolinensis. 4. Green, yellow. July. Carolina. 1795. Syn., *F. Walteri*.

Fraxinella. *Dictamnus*.

Fraxinus. The Ash. (*Fraxinus* is the Latin for an ash-tree. Nat. ord., *Oleineæ*; Tribe, *Fraxineæ*. Syn., *Ornus*.)

Hardy deciduous trees, with green flowers. Seeds ripe in October, then to be collected, and stored in thin layers in the ground, mixed with sandy soil, and turned once or twice during the winter; the seeds sifted from the soil, and sown in March or April. Most of the species may be propagated by seeds, and the most distinct of them, as also the varieties by grafting. Dry, deep loam makes them produce the best timber. The *Weeping*, the *Silver*, and *Golden-barked* varieties of *F. excelsior* are interesting.

Fritillary as a Florist's Flower.

Propagation: by Offsets.—The offsets are produced round the old bulbs; these should be detached every second or third year when the bulbs are taken up, and be planted in a bed of light, rich earth, each variety by itself, where they may remain till they are large enough to flower. Then take them up, and plant them in October, either in 5½-inch pots, three or four bulbs in a pot, or plant them in patches near the front of the mixed flower-border. The above remarks apply only to the smaller kinds of *Fritillaria*. The noble *F. imperialis*, when the bulbs attain a certain size, produces two flower-stems, and each stem perfects a bulb. They may then be taken up, divided, and replanted. This species, on account of flowering early, may be planted when divided into beds in the grouped flower-garden, which they will highly ornament, and will die down early enough to be succeeded by summer flowers. This species is too large for pots.

Soil.—The Crown Imperial, with its varieties, should be planted in a deep, rich soil, well drained. If the soil is not rich, it must be made so by the addition of a good dressing of well-decomposed manure.

If the smaller species be cultivated in pots, the proper soil for them will be a compost of turfy loam, peat, and vegetable mould, in equal parts.

Growing Season.—All the smaller kinds of the Fritillary will flower beautifully in pots. Pot them in October in 5½-inch pots, four bulbs in each, in a light, rich compost. Plunge the pots in coal-ashes in a bed, and protect them through the winter with hoops and mats. There they may remain till they flower, and then be removed into the greenhouse. When intended to bloom in the open ground, plant them in patches in the mixed flower-border.

Resting Season.—As soon as the blooming season is over and the leaves decayed, take the bulbs up, and keep them in a cool, rather moist place, till the season for planting arrives again.

Frog Orchis. *Gymnadenia virens*.

Frost. If a plant be frozen, (and though some defy the attacks of frost, others are very liable to its fatal influence,) death is brought upon them as it is in the animal frame, by a complete breaking down of their tissue; their vessels are ruptured by the expansion of

the ice, when it thaws and putrefaction follows.

The following contingencies render a plant especially liable to be frozen:

First.—Moisture renders a plant susceptible of cold. Every gardener knows this. If the air of his greenhouse be dry, the plants within may be submitted to a temperature of 32° without injury, provided the return to a higher temperature be gradual.

Secondly.—Gradual decrements of temperature are scarcely felt. A myrtle may be forced and subsequently passed to the conservatory, to the cold-pit, and even thence to an open border, if in the south of England, without enduring any injury from the cold of winter; but it would be killed if passed at once from the hothouse to the border.

Thirdly.—The more saline are the juices of a plant, the less liable are they to congelation by frost. Salt preserves vegetables from injury by sudden transitions in the temperature of the atmosphere. That salted soil freezes with more reluctance than before the salt is applied, is well known, and that crops of turnips, cabbages, cauliflowers, etc., are similarly preserved, is equally well established.

Fourthly.—Absence of motion enables plants to endure a lower degree of temperature. Water may be cooled down to below 32° without freezing; but it solidifies the moment it is agitated.

The seeds of some plants are benefited by being frozen, for those of the rose and the hawthorn never germinate so freely as after being subjected to the winter frosts.

Freezing is beneficial to soils, not only by destroying vermin within its bosom, but by aiding the atmosphere to pervade its texture, which texture is also rendered much more friable by the frost. A soil in our climate is rarely frozen to a depth of more than four inches, and in extremely hard winters it does not penetrate more than six inches in light soils, and ten inches in those that contain more clay, or an excess of moisture.

If a plant be frozen, dip it into the coldest water, or syringe it, and put it into a dark, cold cellar, so that it may thaw gradually.

Frost, degrees of. When a gardener uses this phrase, he means degrees of cold below 32° Fahrenheit, the freezing point of water.

Froth-fly. See *Tettigonia*.

Fruit-room. Fruit for storing should be gathered before it is quite mature;

for the ripening process, the formation of sugar, with its attendant exhalation of carbonic acid and water, goes on as well in the fruit-room as in the open air at the season when the functions of the leaves have ceased, and the fruit no longer enlarges. In gathering fruit, every care should be adopted to avoid bruising; and to this end, in the case of apples, pears, quinces, and medlars, let the gathering basket be lined throughout with sacking, and let the contents of each basket be carried at once to a floor covered with sand, and taken out one by one, not poured out, as is too usual, into a basket, and then again from this into a heap; for this systematic mode of inflicting small bruises is sure to usher in decay, inasmuch as that it bursts the divisional membranes of the cells containing the juice, and this being extravasated, speedily passes from the stage of spirituous fermentation to that of putrefaction. To avoid this is the principal object of fruit storing, whilst, at the same time, it is necessary that the fruit shall be kept firm and juicy. Now it so happens that the means required to secure the one also effects the other.

The following, we think, will be found safe principles to guide the inexperienced:

Site.—A somewhat low level, with a sub-soil, perfectly dry, or rendered so. We have said low, because we feel assured that by keeping the floor, if possible, even a little below the ground level, less fluctuation of temperature will be experienced. Sooner, however, than be liable to much damp, we would go as much above the level as is necessary in order to avoid it. Concrete should be used for the flooring, and a portion of the foundation walls done in cement, to prevent the transmission of damp upwards by capillary attraction. The rats and mice are great annoyances; the cement and concrete would keep them at arm's length. A preventive drainage may be applied also round the exterior, if the locality be damp.

Aspect.—An easterly or northerly one; any point but south or south-west.

Frost.—The house to be rendered perfectly secure against this. We would never have the general store-room sink below forty or rise above fifty degrees. To create an artificial warmth, and merely to keep out the cold, or rather, to procure, as much as possible, the amount of warmth which the interior possesses, are two very different affairs. The preservation of the natural interior warmth in winter is best effected by double walls,

possessing a cavity of some three inches in width. The power of what are termed hollow walls, as non-conductors of heat, is well known. Neither can exterior damp be readily transmitted; and, moreover, such are cooler in summer; for the sluggish agency of such walls in transmitting heat is as much in keeping out summer heats as the colds of winter. If the roof is an exterior one, it should either be double, or other means taken to keep out the summer heat.

Air.—The power of thorough ventilation when necessary, and equally the power of rendering it almost hermetically sealed is necessary. Of course, a very liberal ventilation is needed when much fruit is housed in the autumn. There should, therefore, be a special provision for both the egress of moisture, and for the ingress of fresh and dry air. The higher the level at which the latter enters, the brisker will, in general, be the circulation.

Light.—Windows to admit light, of course, for the sake of operations in the room; generally speaking, however, a fruit-room cannot be kept too dark. Most good practitioners agree in the necessity of excluding light as much as possible. Scientific men say, that the surface skin of fruit perspires exactly as the surface of leaves, and that light is a prime agent in inducing such perspiration: hence, heat and light are conjoint causes of shrivelling. The windows or other apertures, therefore, must be provided with close-fitting shutters, and these should be double, even as the walls. During severe weather, mats inclosing hay may be fastened over the exterior.

As to artificial heat, we think every good general fruit store-room should open into a small closet, which should be so fitted up as to produce an artificial warmth when necessary. If adjoining a mushroom-house on the one side, or any place where a surplus of heat was available, such would be readily accomplished without extra expense in fuel. Some persons have advocated the placing piping to convey heat inside the cavity of the exterior walls: this sounds somewhat philosophical, inasmuch as in such a situation, with a slight amount of controllable ventilation, the non-conducting cavities might be kept dry and warm. The situation of pipes or other apparatus, however, should depend on the arrangement made for the fruit; the heating source, pipes, etc., being as far removed from them as possible, and certainly not immediately beneath them. Such a little closet might possess merely

a stand for drawers down the centre ; which stand should be an exact counterpart of a stand in the centre of the general store-room ; and the best pears, or other tender fruits, being placed in parcels in the general store, might be removed in portions to this ripening room, a whole drawer at once, without moving the fruit.

Fuchsia. (Named after Leonard Fuchs, a German botanist. Nat. ord., *Onagraceæ*.)

Shrubs or small trees. For culture, see below. There are numerous garden hybrids.

- F. acynifolia*. Rose, variegated with white. Mexico.
- *alpestris*. 20. Crimson. August. Brazil. 1841. B. M. t. 3999.
- *amplia*. 3-5. Scarlet. June. Andes of Ecuador. 1877. B. M. t. 6839.
- *apetala*. 10. Purple. September. Chili. 1824.
- *arborescens*. 16. Pink. October. Mexico. 1824. Syn., *F. paniculata*.
- *bacillarvis*. 5. Rose. July. Mexico. 1829. B. R. t. 1480.
- *boliviana*. Crimson. Bolivia. 1876. Rev. Hort. 1876, p. 150.
- *coccinea*. 2. Crimson. 1878. B. M. t. 5740. *F. coccinea* of gardens is usually *F. magellanica*; the true plant is known by its short hairy petioles and hairy twigs.
- *conica*. See *F. macrostema*, var. *conica*.
- *coralliina*. 20. Crimson, deep purple. Syn., *F. exoniensis* of G. C. 1833, xx. p. 565.
- *cordifolia*. 5. Orange. August. Mexico. 1840. B. R. 1841, t. 70.

- *venusta*. 6. Purple. October. Mexico. 1825.
- *virgata*. 4. Scarlet, purple. August. Mexico. 1825.

Fuchsia Culture.—*Propagation by Cuttings.*—The best time for this is in February and March. The plants require a little heat to stimulate them into growth. The best kinds of cuttings are the young shoots taken off close to the old wood as soon as they are an inch long. Fill a sufficient number of 5-inch pots with a compost of loam and leaf-mould, in equal parts, to within an inch of the top; fill the remaining space up with silver sand; water it gently to make it firm, then put in the cuttings after trimming off the lower leaves, give another gentle watering, and place them in a mild hotbed, or in a propagating house. If in the latter, place hand-glasses over them. The cuttings will soon strike root, and should then be potted off into the smallest pots; shade them from the sun for a time, and then repot them into pots two sizes larger.

By Seed.—They are as easily raised from seeds as by cuttings. The object of raising them in this way is not so much to increase the plants as to raise improved varieties. There are two divisions, in regard to colour, that should be aimed at—light and dark varieties, and the colours in each ought to be well defined. The light ones should have the sepals pure white, and the corolla rich purple. Size is also a necessary quality, and a good form is also indispensable.

The sepals should be stout and broad and well reflexed; that is, turned upwards, to show off the corolla to the greatest advantage. The corolla should be large, and protrude boldly out from the sepals. It should be round and cup-shaped. The flower-stalk should be not less than three inches long, which will allow the flower to hang down gracefully. The flowers should be produced abundantly, and the foliage not too large or coarse. The same points should appear in the dark varieties, except the colour of the sepals, which should be of the brightest scarlet or crimson. Though a fine self-coloured flower, with every good point, is not to be despised, yet a purple corolla, with the scarlet or dark crimson tube, all other points being present, is the perfection of a good dark Fuchsia.

Saving the Seed.—Any variety possessing one or more of the above qualities (form being indispensable) is one to save seed from. Supposing a fine-shaped flower, with a tolerably pure whitetube, but deficient in a good corolla of the right form and colour; then take the pollen of a variety that has a good corolla, and apply it to the stigma of the one with a good tube and sepals, and save the seed. The same principle must be followed to improve the dark varieties. When the seed is ripe, gather the berries, crush them with the fingers, and wash away all the pulp; then spread the seed on a sheet of paper, and expose it to the sun till it is dry. Then put it up in brown paper, and store it away till March; sow it then in shallow pots, potting off the plants as soon as they can be handled, and grow them on till they flower. Seedlings will flower in 4-inch pots, so that a great number of them may be grown in a small space. As soon as they flower, choose such as have good points; and give them a good shift into larger pots.

Summer Culture.—Pot the old plants early in the spring. Commence by shaking off the greater part of the old soil, reducing the roots and trimming in the branches, so as to leave them in a pyramidal form; pot in the proper soil, and place them in a heat of 55° by day, and 50° by night. Water moderately, and syringe overhead frequently. When the plants are freely growing, give weak liquid-manure every other time. Young plants should have a good shift from 5-inch to 8-inch pots. The tops should be nipped off, to force out the lower branches, the great object being the pyramidal form. One of the upper shoots should be removed as soon as the lower ones have pushed a few inches, and the

other tied to a stick, to be again stopped when it has advanced about a foot. Proceed in this way, with both old and new plants, till the desired height is attained. The side-shoots, if not sufficiently numerous, should be stopped also, to cause the right number of side branches to be produced. The potting should finish in 12-inch pots, which are sufficiently large to make fine plants fit for the exhibition tables.

Winter Culture.—As soon as the bloom is over set the young plants out of doors in some open place in the garden. The older plants may either be thrown away, or be planted out in the borders, it not being worth while to keep them the third year. When the frost begins to appear take the plants under cover, either under the stage of the greenhouse, or in a back shed, or even a cellar, where the severe frost cannot reach them; here they may remain without water till the potting time comes round again.

Soil.—Mellow, strong, yellow loam one-half, well-decomposed hotbed manure one-quarter, and one year old decayed tree leaves one quarter, all thoroughly mixed, will form a suitable compost.

Insects.—The green fly and red spider are very apt to find their way to the young shoots. See **Aphis** and **Acarus**.

Open Border Culture.—The whole of those having the habit of the old *coccinea*, *virgata*, *conica*, *gracilis*, *globosa*, etc., are well-fitted for flower-garden purposes, requiring no attention but cutting them down after the first frost, and covering the stools with moss, coal-ashes, or other litter, to exclude the frost, removing it in April, and thinning the shoots in May. When it is desirable to keep such kinds as *coccinea* as dwarf as *globosa*, raising the plants out of the ground in May, and shaking the soil from them before transplanting them, will be effectual. This, also, furnishes a good means for increasing the stock. Good stout cuttings of the stems, planted at the end of October, in the open ground, will furnish nice little plants in spring, if the ground is covered with moss or litter; for though what is above ground will be killed, what is below the moss will be safe. Those like *fulgens* in their habit must be kept dry if left out; it is better to take them up, and house them in a shed where frost will not reach them. *Standards of any kinds* for the lawn may be thus inserted in dry earth in a sled, and transplanted again in April or May. Most of the hybrids will stand the winter in the open garden, and push strongly in the spring, if, in addition to

being kept from frost, they are also kept dry. Though thus able to endure cold, they will, also, stand a high temperature and a moist atmosphere when growing, and, in these circumstances, grow with great rapidity. *F. corymbiflora* must have the wood well ripened, and not be pruned too close. *Spectabilis* and *serotifolia* are late bloomers, and must be treated accordingly. All sorts in pots look best trained to a simple stem.

Fuel is no small item in the annual expenditure of the stove, greenhouse, and conservatory departments, and therefore deserves consideration. The cheapest of all fuel is the breeze, or small coke, procurable at gas-works.

The heating qualities of the different coals known in Great Britain are in the following proportions :

Scotch Cannel	199
Lancashire Wigan	196
Yorkshire Cannel	188
Newcastle (best Wallsend)	169
Gloucestershire (Forest of Dean)	108
Welsh (common)	25

Hence, if the Scotch Cannel coal cost 19s., when the Gloucestershire could be had for 10s. per chaldron, the latter would be no cheaper; for the heating powers of the first are as 199 to 108 of the latter. In other words, 108 chaldrons of Scotch would afford as much heat as 199 chaldrons of Staffordshire.

The following are the quantities of the fuels named required to heat eight gallons of water, from 52° to 112°.

Caking coals	lbs.	1.2
Splint or hard coal	}	3.13
Cannel Coal		
Cherry or soft Coal	1.5	
Wood of lime	3.10	
— beech	3.16	
— elm	3.52	
— oak (chips)	4.20	
— ash	3.50	
— maple	3.00	
— service	3.	
— cherry	3.20	
— fir	3.52	
— poplar	3.10	
— hornbeam	3.37	
Peat (average, not compressed)	7.6	
Charcoal of wood	1.52	
— peat	3.28	

It is essential to good and profitable fuel that it should be free from moisture; for unless it be dry, much of the heat which it generates is consumed in converting that moisture into vapour: hence the superior value of old dense, dry wood, to that which is porous and damp. A pound of dry will heat thirty-five pounds of water from 32° to 212°; but a pound of the same wood in a moist or fresh state will not similarly heat more than twenty-five pounds. The value,

therefore, of different woods for fuel is nearly inversely, as their moisture; and this may be readily ascertained by finding how much a pound weight of the shavings of each loses by drying during two hours, at a temperature of 212°.

Fugo'sia. (Named after *Bernard Cien-Fuegos*, a Spanish botanist. Nat. ord., *Malvaceæ*; Tribe, *Hibisceæ*. Allied to *Malvaviscus*.)

Stove evergreen shrubs. Cuttings of the points of shoots in April or May, in sand, under a bell-glass, and placed in a mild bottom-heat; peat and loam, with a little silver sand.

F. cuneiformis. White, purple. August. W. Australia. 1866.

— *hakeaefolia*. 5. Lilac, red. August. Swan River. 1846. B. M. t. 4261. Syn., *Hibiscus multifidus*, Paxt. Fl. Gard. vii. p. 103.

— *heterophylla*. Yellow, red. August. St. Martha. 1845. B. M. t. 4218.

Full-Flower. See **Double-Flower.**

Fuma'ria. Fumitory. (From *fumos*, smoke; referring to the disagreeable smell of the plant. Nat. ord., *Fumariaceæ*. Allied to *Corydalis*.)

Hardy annuals. If once sown in March or April, on rock-work, or undisturbed banks, they will sow themselves annually, and maintain themselves without care or trouble.

F. capreolata. 4. Flesh. July. Europe. Climber.

— *Burche'lii*. 4. April. Cape of Good Hope. 1816.

— *leucantha*. 1½. White. August. Corsica. 1836.

— *me'dia*. 3. Flesh. July. Britain.

Fumigating is employed for the destruction of certain insects; the inhaled vapour or smoke arising from some substances being fatal to them. *Tobacco* is the usual substance employed; and it may be ignited, and the smoke impelled upon the insect by *bellows*; or the ignited tobacco may be placed under a box, or within a frame, together with the affected plant. The vapour of *spirit of turpentine* is destructive to the scale and other insects, employed in this mode. Mr. Mills has stated the following as the best mode of fumigating with tobacco. According to the size of the place to be fumigated, one or more pieces of cast iron, one inch thick, and three inches over, are made red hot (pieces of old tiles, such as are used for covering smoke flues, would probably answer equally well); one of these is placed in a twenty-four sized pot, on which is put the quantity of tobacco considered necessary to charge the structure with smoke sufficient to destroy insect life. To fumigate an ordinary sized eight-light house, use three heaters, and three

twenty-four sized pots, which are best placed on the front flue or walk; one pound of strong tobacco is put on the three heaters in equal parts, and this is found sufficient to fill the house, so as to destroy all the kinds of insects that perish by fumigation. The system has these advantages: the tobacco is so quickly consumed, that the house is completely filled in a very short time, and but little smoke can escape before the insects are destroyed; the pure heat from the iron heaters prevents injury from gas, and as no blowing is required there is no dust, it being only necessary to put the tobacco on the heaters and leave the house. A better mode is to soak the tobacco in a strong solution of saltpetre, and when dry to ignite it. The combustion is so complete and instantaneous that a smaller quantity is sufficient.

To fumigate with sulphur, paint the hot-water pipes with some sulphur mixed with whitewash; or put this mixture against the side of the flue furthest from the furnace; or put some sulphur on a hot-water plate, and keep the water in this boiling by means of a lamp.

Fumitory. *Fumaria*.

Fungi constitute a large class of plants varying much in size and structure, but all agree in being destitute of green colouring matter (*chlorophyll*), and consequently having to derive, at least part, of their nourishment from some other vegetable or animal matter. The chief one of use to the gardener is the mushroom (*Agaricus campestris*), which see. Many are extremely minute, and their appearance on living plants, is a sure sign of some weakness in the plant's constitution, due to some improper treatment, such as insufficient drainage, etc. Some of these, such as the Barberry fungus, live on two distinct genera of plants in the course of their life cycle, and so may be eradicated by the destruction of one of these host plants. The number of these fungi is so great, and the remedies for them too numerous to mention here, that when they make their appearance, to the injury of plants, they should at once be submitted to some competent authority for identification and advice as to their extermination.

Funkia. (After *H. Funk*, a German botanist. Nat. ord., *Liliaceæ*; Tribe, *Hemerocallidæ*. Allied to *Hemerocallis*.)

Hardy herbaceous perennials, from Japan; dividing the roots; sandy loam, and a dry situation.

- F. albo-marginata*. 1½. Lilac. July. 1837. B. M. t. 3657.
 — *grandiflora*. 2. Pure white. July. Japan. Syn., *F. japonica*.
 — *lanceolata*. 1. Lilac. August. 1829. Swt. Fl. Gard. ser. 2, t. 273.

- *villosa*. † April. Caucasus. 1825.

Gagnebina. (Probably the native name of one of the species. Nat. ord., *Leguminosæ*; Tribe, *Adenanthereæ*. Allied to *Prosopis*.)

Stove evergreens, from Mauritius. Seeds in hotbed, in spring, after being moistened for several hours in warm water; cuttings of half-ripened shoots in sand, in April, under a bell-glass, and in mild bottom-heat; peat and loam, both turfy and fibry.

- G. axillaris*. 6. Yellow. 1824.
- *tamariscina*. 6. Yellow. 1824.

Gahnia. (After Dr. Henry Gahn, a botanist, who wrote on grasses. Nat. ord., *Cyperaceæ*.)

Stove sedge; sandy loam; division.

- G. aspera*. Whitish-yellow; fruit reddish-yellow. Fiji. 1887.

Gaillardia. (Named after M. Gaillard, a French patron of botany. Nat. ord., *Compositæ*; Tribe, *Helenioideæ*. Allied to *Helenium*.)

This, like many other composite genera, is inclined to sport from seeds. Numerous varieties, both single and double-flowered, are now in cultivation. Hardy herbaceous plants, with the exception of *coronata* and *amblyodon*, which requires a cold pit in winter. In cold, damp situations, cuttings of *pulchella* and *picata* may also be saved in a similar manner. Cuttings under a hand-light in summer, and division of the root in spring; sandy loam, in sunny position.

- G. amblyodon*. Blood-red. October. Texas. 1873. B. M. t. 6081. Annual.
- *aristata*. Orange. August. N. Amer. 1812. B. R. t. 1186. Syn., *G. perennis*.
- *grandiflora*. Large-flowered variety. Gard. Dec. 13, 1824.
- *bicolor*. See *G. pulchella*.
- *coronata*. Red, brown. July.
- *Drummondii integrifolia*. 2. Carnation, yellow. August. Louisiana. 1833.

- G. hybrida splendens*. Garden hybrid.
- *Lorenzia*. A variety of *G. pulchella*.
- *picata*. See *G. pulchella*, var. *picata*.
- *pulchella*. 3. Crimson, tipped with yellow. Autumn. N. America. Syn., *G. bicolor*. B. M. t. 1602.

— *picata*. Leaves slightly succulent. Syn., *G. bicolor*, var. *Drummondii*, B. M. t. 3368. In addition to this there are numerous varieties in gardens, such as: *Borisselari*, *coronata*, *hybrida*, *Loiseletii*, *Lorenzia* (Gf. t. 1083), *Richardsonii*, *Telemachi*, *tricolor*, etc.

Gala'ctia. (From *gala*, milk; in reference to the milky juice of some of the species. Nat. ord., *Leguminosæ*; Tribe, *Phaseoleæ*. Allied to *Glycine*.)

Deciduous, by division of the plant, and grown in sandy loam. Stove, by cuttings of short, stubby side-shoots in sand, in April, under a bell-glass, and plunged in a hotbed; sandy loam and peat.

HARDY DECIDUOUS TWINERS.

- G. glabella*. 3. Purple. July. N. Amer.
- *molis*. 3. Purple. July. N. Amer. 1827.

STOVE EVERGREEN TWINERS.

- G. cubensis*. Rose. July. Cuba. 1826.
- *filiformis*. 3. Purple. July. S. America. 1820. Syns., *Galega filiformis*, Jacq. Ic. t. 573, and *Sweetia filiformis*.
- *longifolia*. 4. Purple. S. America. 1818. Syns., *Galega longifolia*, Jacq. Ic. t. 572, and *Sweetia longifolia*.
- *pendula*. 6. Red. July. Jamaica. 1794.
- *pinna*. See *Barbieria polyphylla*.
- *sericea*. 6. July. Bourbon. 1824.
- *striata*. 4. Yellow. July. S. America. 1818. Syn., *Glycine striata*, Jacq. Vind. t. 76.

Galactites. (From *gala*, milk; referring to the juice and to the milk-white veins on the leaves. Nat. ord., *Compositæ*; Tribe, *Cynarioideæ*. Allied to *Silybum*.)

Hardy annuals, requiring to be sown in the flower-borders in March or April.

- G. australis*. 1. Purple. July. Australia. 1824.
- *tomentosa*. 13. Purple. July. South Europe. 1738.

Galactode'ndron. Cow-tree. (From *gala*, milk, and *dendron*, a tree. Nat. ord., *Urticaceæ*; Tribe, *Artocarpææ*.) See **Brosimum**.

- G. utile*. B. M. t. 3723-4. See *Brosimum Humboldtii*.

Galangale. *Kempferia*.

Galanthus. Snowdrop. (From *gala*, milk, and *anthos*, a flower. Nat. ord., *Amaryllidææ*.)

Hardy bulbs. Offsets; division of masses of bulbs; common garden-soil; should be lifted every four or five years.

- G. Alleni*. White. March. Caucasus. 1891.
- *caucasicus*. White, green. February. Caucasus. 1887.

Galat'ella. (A diminutive of *gala*, milk, literally, *milky*; referring to the colour of the leaves. Nat. ord., *Compositæ*.) United to **Aster**.

Hardy herbaceous. Division in spring; common garden-soil.

- G. punctata*. 2½. Violet, yellow. August. Hungary. 1815. Syn., *Aster acris*, var. *punctatus*.

Gal'ax. (From *gala*, milk; referring to the milk-white flowers. Nat. ord., *Diapensiaceæ*; Tribe, *Galacnææ*.)

Fine bog plants. Divisions in spring; moist, sandy peat; in partially shady border.

- G. aphy'lla*. †. White. July. Carolina. 1786. B. M. t. 754. Syn., *Blandfordia cordata*. Andr. Rep. t. 343.

Galax'ia. (From *galaktido*, to abound in milk; referring to the juice. Nat. ord., *Iridææ*; Tribe, *Sisyrinchicææ*. Allied to *Romulea*.)

Greenhouse bulbs, from the Cape of Good Hope. Offsets; sandy peat, with a little fibry loam. In a state of rest keep in the greenhouse or cold pit. If planted in a sheltered place, out of doors, the roots must be protected from frost.

- G. gram'nea*. Light yellow. July. 1795. B. M. t. 1292.
- *grandiflo'ra*. †. Dark yellow. July. 1799. Andr. Rep. t. 164.
- *mucronula'ris*. †. Purple. July. 1799.
- *ovata*. †. Dark yellow. July. 1799. Jacq. Ic. t. 291.
- *plica'ta*. Jacq. Ic. t. 292. See *Lapeyrouisia fasciculata*.
- *versicolor*. †. Purple. July. 1799.

Galea'ndra. (From *galea*, a helmet, and *aner*, a stamen; referring to the crested male organ on the top of the column. Nat. ord., *Orchidææ*; Tribe, *Vandææ*—*Eulophicææ*. Allied to *Eulophia*.)

Stove terrestrial orchids. Fibry peat, and a little turfy loam, with some broken pots, and pieces of charcoal. Summer temp., 60° to 85°, with moisture; winter, 48° to 55°, and rather dry.

- G. Baué'ri*. †. Pink. August. Guiana. 1840.
- *crista'ta*. Purple. May. Cayenne. 1844.
- *Desacagnolle'na*. Ochre-brown; lip pale sulphur, purple. Para. III. Hort. xxxiv. t. 22.
- *Devonia'na*. 2. Purple, white. May. S. America. 1840. B. M. t. 4610.
- — *Delphi'na*. Red, edged with yellow; lip white, veined with purple. Venezuela. 1887. Lind. t. 80.
- *flave'ola*. Yellowish-brown; lip yellow, dotted with purple. Venezuela. 1887. Lind. t. 90.
- *gra'cilis*. 2. Green, yellow. May. Sierra Leone. 1822. B. R. t. 742. Now referred to *EULOPHIA*.
- *Harveya'na*. Sepia-brown. Tropical America.
- *ju'ncea*. Rosy-purple; lip with a darker edge. Indian Archipelago. 1847. Syn., *Phaius rosellus*. Fl. Ser. t. 301.
- *mi'naæ*. Yellowish-copper, whitish-purple. June. Columbia. 1874.
- *nivalis*. Olive-colour; lip white, violet. Tropical America. G. C. 1882, xvii. p. 536.

Galedu'pa. A synonym of **Pongamia**.

Gale'ga. Goat's Rue. (From *gala*, milk; referring to an old idea that the herbage was superior for milk-cows, goats, etc. Nat. ord., *Leguminosææ*; Tribe, *Galegeææ*.)

Hardy herbaceous, rather rambling perennials. Seeds sown in spring; division of the plant at the same time; common soil.

- G. biloba*. 3. Blue. July. 1823. Swt. Fl. Gard. t. 159.
- *officina'lis*. 4. Blue. July. Spain. 1568. Sibth. Fl. Gr. t. 726.

- *persica*. 2. White. July. Persia. 1826. Swt. Fl. Gard. t. 244.
- — *lilacina*. 3. Lilac. June. Persia. 1830.
- *tricolor*. A synonym of *G. persica*.

EXCLUDED SPECIES.

- G. biflo'ra*. See *Tephrosia biflora*.
- *caribæa*. See *Tephrosia caribæa*.
- *cinerea*. Jacq. Ic. t. 575. See *Tephrosia cinerea*.
- *filiformis*. See *Galactia filiformis*.
- *grandiflo'ra*. See *Tephrosia grandiflora*.
- *longifolia*. See *Galactia longifolia*.
- *mucronata*. See *Tephrosia mucronata*.

Galeo'bdolon. Yellow Dead Nettle. (From *gale*, weasel, *bdolos*, fœtid; referring to the strong disagreeable odour of the plant. Nat. ord., *Labiatææ*; Tribe, *Stachydeææ*.) See **Lamium**.

- G. hirtum*. See *Lamium Galeobdolon*.

Galeo'ttia. (In honour of *M. H. Galeotti*, of Ghent, who travelled in Mexico. Nat. ord., *Orchidææ*; Tribe, *Vandææ*—*Cyrtopodiææ*.) Now united with **Zygopetalum**.

Stove orchid. See **ORCHIDS**.

- G. Bearu'monia*. Green, brown. Brazil. 1850.
- *fimbria'ta*. Syn., *Batemannia fimbriata*.

Galinsoga. (After *Don M. de Galinsoga*, a Spanish botanist. Nat. ord., *Compositæ*; Tribe, *Heliantheæ*.)

Weedy annual. Common soil; seeds.

G. parviflora. 1-2. Yellow, white. Autumn. Peru, naturalized, and a pest in the market gardens around Kew.

— *trilobata*. B. M. t. 1895. See *Tridax*.

Gali'pea. (The Indian name in South America. Nat. ord., *Rutaceæ*; Tribe, *Cuspariæ*. Allied to *Almeidea*.)

The Angostura bark is that of *G. trifoliata*. Stove evergreen shrubs. Cuttings of ripened shoots in sand, under a bell-glass, in April, and in heat; peat and loam.

G. macrophylla. 2. Pink. Brazil. B. M. t. 4948.

— *odoratissima*. 2. White. May. Rio Janeiro.

— *trifoliata*. 4. Green. Guiana. 1816.

Gal'ium. Bed Straw. (From *gala*, milk; referring to the flowers of *G. verum* having been used to curdle milk. Nat. ord., *Rubiaceæ*; Tribe, *Galiceæ*. Allied to *Rubia*.)

Few of these plants are interesting to the gardener, except to cover rock or root-work. They possess, in a more or less degree, the dyeing qualities of Madder. Of the following selected species all are herbaceous perennials, except *G. suaveolens*, which is an annual. Annuals merely require to be sown in the common border, in March; and the perennials divided at the same time.

G. campanulatum. A synonym of *Asperula galioides*.

— *capillipes*. 1. White. October. Russia. 1838.

— *glaucum*. Synonymous with *Asperula galioides*.

— *græcum*. $\frac{3}{4}$. Purple. July. Candia. 1798.

— *persicum*. Yellow. July. Persia. 1837.

— *purpureum*. 1. Purple. July. Switzerland. 1831.

— *rubrum*. 1. Purple. July. Italy. 1597.

— *suaveolens*. 1. White. July. North Europe. 1821.

— *tauricum*. $\frac{3}{4}$. Yellow. July. Tauria. 1818.

— *Vaillantii*. 2. Green. May. England. Eng. Bot. ed. 3, t. 657.

Gall is a tumour formed in consequence of the part being punctured by an insect, the tumour becoming the nidus of the insect brood. The Oak-apple caused by the *Cynips quercu* is a familiar example; as, also, are the bunches of leaves, not unlike a rose, on the Rose, Willow, and the mossy tufts on the twigs of the Wild Rose, and erroneously called *Bedeguar*. These tufts are caused by the *Cynips rosæ*, another species of Gall-fly.

Galphi'mia. (An anagram of *Malpighia*, to which it is nearly allied. Nat. ord., *Malpighiaceæ*; Tribe, *Malpighiæ*.)

Stove evergreens, from Mexico, with yellow flowers. Cuttings of young shoots, firm but not too old, in sand, under a bell-glass, and in bottom-heat; peat and loam.

G. glandulosa. April. 1824.

— *glauca*. 8. 1829. Maund Bot. i. t. 18.

— *gracilis*. 8. 1848.

— *hirsuta*. September. 1824. Rev. Hort. 1847, p. 281.

Galto'nia. (Named after *Francis Galton*, author of a "Narrative of an Explorer in South Africa." Nat. ord., *Liliaceæ*; Tribe, *Scilleæ*. Allied to *Hyacinthus*.)

Hardy bulbs. Seeds and offsets. Rich leaf-mould and a little sandy peat. Planted in a sheltered border, they are exceedingly ornamental plants; the flowers are large and drooping.

G. andriacans. 3. White. Syn., *Hyacinthus andriacans*. Ref. Bot. t. 174.

— *clavata*. Greenish. S. Africa. B. M. t. 6885.

Requires protection.

— *princeps*. 3. White. Syn., *Hyacinthus princeps*. Ref. Bot. t. 175.

Gamma Moth. Just after sunset, in October, and hovering round flowers, may be seen this moth (*Noctua gamma*). It is called the Gamma Moth, because about the middle of the upper wings, but towards their inner border, there is a silvery shining mark, like the Greek letter gamma (γ). The shape of this mark has acquired to this insect another name, the Y-Moth. The outspread

wings are about an inch across; the upper ones grey-coloured, marbled with brown, and shining; the under wings pale ash, with a brown edge; the head and throat brownish, edged with grey lines; the belly, or abdomen, yellowish-grey, tufted with brown hairs. In October they deposit their eggs; and it would be an aid to the warfare against them to ascertain what plants they select for this purpose. The eggs hatch at various times from May to September, but chiefly during July. The caterpillars proceeding from them are green, beset with greenish single hairs; head brownish-green; on the back and sides three or four yellowish-white lines; feet twelve in number, and marked with a yellow stripe. These caterpillars commit great ravages, especially in the south of England, upon our peas and other garden vegetables, the best remedy for which is hand-picking.

Gamochla'mys. See *Spath-anthem*.

Gamole'pis. (From *gameo*, to unite, and *lepis*, a scale; the scales of the involucre are united into a cup. Nat. ord., *Compositæ*; Tribe, *Senecionideæ*. Allied to *Othonna*.)

Greenhouse dwarf showy shrub. Seeds; ripened cuttings, in sand, under a hand-glass. Rich sandy loam.

G. euryopoides. 1-2. Yellow. S. Africa. 1863. B. M. t. 6249.

Gangrene. See **Canker**.

Garcinia. Mangosteen. (Named after *Dr. Garcia*, an eastern traveller. Nat. ord., *Guttiferae*; Tribe, *Garcineæ*. Allied to *Mammea*.)

Of all the fruits in the East, that of *G. Mangostana* is the most highly extolled by Europeans; and the Gamboge from Siam is furnished by *G. Gambogia*. Stove evergreen trees. Cuttings of ripened shoots in sand, under a bell-glass, in a strong bottom-heat; peat and loam. *G. cornea*. 30. Yellow. Indian Archipelago. 1823. Wight Ic. t. 105.

— *Co'wa*. 20. Yellow. India. 1822.

— *Gambogia*. 30. Yellow. Indian Archipelago and Ceylon. 1820.

— *Mangostana*. 20. Purple. Java. 1789.

Garden. Is generally understood to mean that portion of the ground surrounding or near a residence, and designed either for the purpose of growing fruit and vegetables, or for the cultivation of flowers, ornamental trees, etc. These, however, will all be treated under their various heads. Fruit garden. Flowergarden. Pleasure garden, etc. etc.

Garden Balsam. *Justicia pectoralis*.

Garden Beetle. In June and July, a small, pretty beetle very often may be found among the petals of white roses. It is nearly half an inch long, and rather less than a quarter of an inch broad. Its wing-cases are reddish-brown, shining, and shorter than the body; the body and head are dark green, and the antennæ reddish, having at their ends a dark green club. This is the garden beetle (*Phyllopertha horticola* and *Melolontha horticola* of some). It feeds on the leaves of apples, pears, and roses, gnawing them full of small holes, and even transferring its attacks to the young fruit of the apple. During the latter part of July the female retires into the earth for the purpose of there depositing her eggs, from which the grubs are speedily produced, and feed upon the roots of plants. The only mode of reducing the number of these beetles is by searching for them during the evening, when, if detected, they stiffen their outstretched legs, and feign death; but in the day they fly about swiftly, and are captured with great difficulty.

Garden Pebble-Moth. (*Scopula forficularis*.) The perfect insect, says

Mr. Curtis, measures rather more than an inch across when its wings are expanded. The upper pair are hazel-coloured, with four stripes, two of which are distinct, and the other faint; the under wings as well as the body are whitish; and on the former, near the centre, there is a curved brown streak, and another black on the margin. The first brood of caterpillars occurs in May, and the second in the autumn; and when very numerous they do considerable injury to cabbages and plantations of horse-radish. The caterpillar is eight or ten lines long, with the head of a light-brown colour, and the body is yellowish green, with black, longitudinal stripes. Like other caterpillars, it may be destroyed by being dusted with white hellebore powder.

Gardener. The day is gone when the spade and the blue apron were the only appropriate devices for the gardener. He must now not only have a thorough practical knowledge of his art, but he must also have an intimate acquaintance with its scientific aspects. No man can have stored in his mind too much knowledge; but there are always some branches of information of more value than others. Of these, to the gardener, there are none so important as botany and chemistry—botany, physiological as well as morphological—chemistry, especially as applied to the examination of organic nature. The under gardeners, though necessarily hardy, and the open air is their appropriate whereabouts, should have work assigned to them suitable to the clemency or inclemency of the season; for no men are more liable to suffer early in life from rheumatism. There are two golden sentences which we would have always kept in mind by the gardener:

1. Let all things be done orderly.
2. Be always ready to give an account of your stewardship.

Gardener's Garter. *Phal'laris*.

Gardenia. (Named after *Dr. Garden*, an American. Nat. ord., *Rubiaceæ*; Tribe, *Gardenieæ*.)

Sweet-scented evergreen shrubs. Cuttings of shoots half ripe, in sand, under glass, and in a moist bottom-heat. This moist heat, when growing and when coming into bloom, is the very life of all the stove species. Even the greenhouse kinds do best when pruned after flowering, grown rapidly afterwards; if in a moist atmosphere from decomposing material, such as dung and leaves, all the better; hardened off and ripened by exposure to light and air in autumn, rested in a cool and dryish atmosphere in winter, and started into bloom in a moist heat again, and then removed to the greenhouse; peat and loam.

Gardening is the art of cultivating and arranging plants, so as to obtain from them the greatest amount of produce and of beauty.

Garden Rocambole. *Allium ophioscorodon*.

Garden Swift Moth. (*Hepialus lupulinus*.) The caterpillar of this moth is more indiscriminate in its attacks upon our plants than any other ravager of the garden. The roots of the auriculas, snow-drops, bear's-ear, parsnips, lettuces, celery, potatoes, and strawberries, have all been observed destroyed by this larva. The moth, usually, is chalky-brown, head and thorax woolly, and its upper wings dark, bright brown, with a broad line of white; but sometimes this is absent, and at other times the upper wings are chalky-white. These moths appear about the end of May, and are very abundant in the evening in meadows and other grassy places. They deposit their eggs apparently without discrimi-

nation, which soon hatch, and the caterpillars produced are cylindrical, and yellowish-white, with black dots and hairs on the upper part and sides of their segments. The caterpillar changes to an ochreous, shining, cylindrical pupa.—*Gard. Chron.*

Gardoquia. (Named after *Gardoqui*, a Spaniard. Nat. ord., *Labiata*; Tribe, *Satureineæ*. Allied to *Melissa*.)

Of all the Lipworts, there is not a greenhouse rival to *G. Hookeri* when well grown. Greenhouse evergreens, except *G. betonicoides*, which is herbaceous. Cuttings of half-ripened shoots in June, in sand, under a hand-glass; peat and loam, with a fair portion of sand, and pieces of broken bricks and charcoal. Winter temp., 40° to 48°; a shady place in summer. They should be tried against a wall, with a slight protection in winter.

G. betonicoides. B. M. t. 3860. See *Cedronella mexicana*.

- *discolor*. Purple. June. Chili. 1827.
 — *Gilliesii*. 2. Lilac. June. Chili. 1828.
 — *Hookeri*. B. M. t. 1747. See *Calamintha coccinea*.
 — *multiflora*. 1. Purple. April. Chili. 1837. B. M. t. 3772.

Garland Flower. *Pleura'ndra cneorum*.

Garlick. (*Allium sativum*.) Grows best on a light, rich soil.

Planting.—It is generally propagated by parting the roots, but may be raised from the bulbs produced on the stems. Plant any time in February, March, and early in April; but the middle of March is the usual time. A single clove to be placed in each hole, made six inches apart, and one deep, in straight lines, six inches distant from each other, care being taken to set the roots downwards. To do this, it is the best practice to thrust the finger and thumb, holding a clove between them, to the requisite depth without any previous hole being made. Keep them frequently hoed, and in June the leaves are to be tied in knots, to prevent the plants running to seed. A few roots may be taken up as required in June and July; but the whole must not be lifted until the leaves wither at the close of July, or in the course of August. It is usual to leave a part of the stalk attached, by which they are tied into bundles, being previously well dried for keeping during the winter.

Garlic Pear. *Crataeva*.

Garrya. (Named after *Mr. Garry*, of the Hudson's Bay Company, who facilitated Douglas' botanical researches in North West America. Nat. ord., *Cornaceæ*.)

Hardy evergreen shrubs. Layers in the autumn, and cuttings toward the end of summer, in sandy soil, under a hand-light; sandy loam.

- G. elliptica*. 6. Green. October. California. 1828. E. R. t. 1686.
 — *Fremonti*. N.W. America. G. C. 1881, xv. p. 431.

Garu'ga. (Its East Indian name. Nat. ord., *Burseraceæ*; Tribe, *Bursereæ*. Allied to *Boswellia*.)

One of the frankincense-trees so celebrated in the East. Stove evergreen trees, with yellow flowers; cuttings of half-ripened shoots in sand, under a bell-glass, and set in a little bottom-heat; peat and loam.

G. madagascariensis. 50. May. Madagascar. 1824.

— *pinna*. 60. E. Ind. 1808. Wight Ic. tt. 1594-5.

Gas-heating. If the flame is supplied with air by the aid of a small pipe communicating with the outside of the house, is inclosed in a small iron stove, and has the gases produced carried away by a pipe, gas may be employed for protecting greenhouse plants in winter. We have known a small greenhouse, 16 feet by 12, thus protected by a single Argand burner.

Gaste'ria. (From *gaster*, a belly; alluding to the swollen base of the flowers. Nat. ord., *Liliaceæ*; Tribe, *Aloineæ*.)

Greenhouse evergreens, from the Cape of Good Hope, and all with red flowers, except where otherwise specified. Many of the species have been described and figured under the name of ALOE.

Gastonia. (After *Gaston de Bourbon*, son of Henri IV. of France. Nat. ord., *Araliaceæ*.)

G. cutispongia. See *Polyscias*.
 — *palmda*. E. R. t. 894. See *Trevesia*.

Gastroca'rpha. (From *gaster*, the belly, and *karpheos*, twigs. Nat. ord., *Compositæ*.)

G. runcinata. Swt. Fl. Gard. t. 229. See *Moscharia*.

Gastrochi'lus. (From *gaster*, belly, and *cheilos*, lip; in reference to the swollen lip. Nat. ord., *Scitamineæ*; Tribe, *Zingibereæ*. Allied to *Hedychium*.)

Must not be confounded with Don's *Gastrochilus*, a synonym of *Saccolobium*. Stove herbaceous perennials. Divisions of the plant as fresh growth is commencing; sandy loam.

- G. Jenkinsonii*. 2. Orange, crimson. June. E. Ind. 1841.
 — *longiflorus*. 2. Yellow, red. July. E. Ind. 1843.
 — *pulcherrimus*. 2. Yellow, pink. August. Rangoon. 1828.

Gastroglottis. See **Liparis.**

Gastrolobium. (From *gaster*, belly, and *lobos*, a pod; inflated seed-pod. Nat. ord., *Leguminosæ*; Tribe, *Podalyriææ*. Allied to *Eutaxia*.)

Greenhouse evergreens, from West Australia, and all with yellow flowers, except where otherwise mentioned. Seeds sown in a bed in spring, after being soaked in warm water; cuttings of half-ripened shoots in May, in sand, under a bell-glass; peat and loam, both fibry, with a portion of silver sand, and small pieces of charcoal; impatient of sour, stagnant soil.

G. acutum. B. M. t. 4040. See *Oxylobium acutum.*

Gastrone'ma. (From *gaster*, belly, and *nema*, a filament; in reference to the filaments seen below the point of insertion. Nat. ord., *Amaryllidææ*. A sub-genus of *Cyrtanthus*.)

Dr. Burchell discovered the pretty bulb, *clavatum*, and flowered it in an open border along with other Cape rarities; its native place at the Cape is in "fields beyond *Camtours* river." Offsets; sandy loam, fibry peat, and dried leaf-mould; plenty of water when growing, and dry when at rest.

G. clavatum. B. M. t. 2291. See *Cyrtanthus uniflorus*.

— *sanguineum.* See *Cyrtanthus sanguineus*. B. M. t. 5218.

— *stamineum.* Rosy-crimson. S. Africa. 1871.

Gaten or **Gater-tree.** *Co'rnus sanguinea.*

Gatherer. The hand is the best instrument for collecting fruit into the basket; but to avoid the danger and

No. 1.

No. 2.

breakage of branches incidental to using long ladders, the following instruments have been designed. No. 1 for apples

and other single fruit; No. 2 for grapes, the stalk of which it severs and retains in its grasp.

Gathering. See **Fruit-room.**

Gaudichaudia. (Named after *C. Gaudichaud*, a French Naturalist. Nat. ord., *Malpighiaceæ*; Tribe, *Gaudichaudææ*.)

Stove evergreen. Cuttings of ripe shoots in summer, in sand, under a bell-glass, and in bottom-heat; peat and loam, with sand, and pieces of charcoal to keep it open.

G. cynanchoides. 10. Yellow. Mexico. 1824.

Gaultheria. (Named after *Dr. Gaulther*, a Canadian. Nat. ord., *Ericaceæ*; Tribe, *Andromedææ*. Allied to *Pernettia*.)

The oil of Wintergreens used to flavour drugs, and also by perfumers, is obtained from the berries of *G. procumbens*. Chiefly by layers and seeds. *G. procumbens* requires a moist peat-soil; *G. Shallon* will grow in any soil. The fruit is prized for its flavour so much by the natives, that they make it into bread for winter use. The greenhouse kinds require peat, and similar treatment, with the exception of a temperature from 35° to 45° in winter.

HARDY.

G. cocci'nea. 1. Pink. Caraccas. 1849.

— *nummularioides.* White, or rosy-pink.

 — *rosea*. Rose. May. Pern. 1843.

Gazania. (From *gazza*, richness; in reference to the large gaudy flowers. Nat. ord., *Compositæ*; Tribe, *Arctotideæ*. Allied to *Gorteria*.)

Natives of Cape of Good Hope. Cuttings of side-shoots, produced in abundance near the base of the plant, in August; more sparingly in spring, in sandy soil, under a hand-light; peat and loam, with a portion of sand. Useful plants on sunny borders in summer.

- G. heterophylla*. ½. Orange. July 1812. Herbaceous.
 — *longica* *pa*. ½. Orange-yellow. July. Algoa Bay.
 — *pavonia*. 1½. Yellow. July. 1804. B. R. t. 35. Syn., *Gorteria pavonia*, Andr. Rep. t. 523.
 — *pinna* *ta integrifolia*. Yellow. 1881.
 — *ringens*. 1. Orange. June. 1755. Syn., *Gorteria ringens*, B. M. t. 90.
 — *spaldens*. 1½. Orange, black, white. Perhaps a hybrid.
 — *subulata*. 1. Yellow. July. 1792.
 — *uniflora*. 1. Yellow. July. 1816. B. M. t. 2270.

Gazania'opsis. (From *Gazania*, and *opsis*, like; resembling the genus *Gazania*. Nat. ord., *Compositæ*; Tribe, *Arctotideæ*.)

Half-hardy perennial. A sunny position in common soil. Seeds; cuttings under a hand-light.

- G. stenophylla*. Leaves bronzy-green to golden yellow, white beneath. Garden hybrid. 1882.

Geisso'is. (From *geisson*, the house tiles; alluding to the imbricated seeds. Nat. ord., *Saxifragaceæ*; Tribe, *Cunoniaceæ*.)

A magnificent stove tree. Racemes of flowers produced on the old wood. Cuttings under a hand-glass in heat. Peat and loam.

- G. racemosa*. Crimson. New Caledonia. 1851. Ill. Hort. ser. 2, t. 385.

Geissome'ria. (From *geisson*, a tile, and *meris*, a part; referring to the way the bracts are imbricated, or fall over each other as tiles on a roof. Nat. ord., *Acanthaceæ*; Tribe, *Justicieæ*. Allied to *Aphelandra*.)

Stove evergreen shrubs. Cuttings of shoots getting firm, any time in summer, in sand, under a bell-glass, and a sweet bottom-heat; loam and peat, with sand, and a little old cow-dung.

- G. aurantiaca*. 2. Orange, red. Autumn. 1848.
 — *coccinea*. Scarlet. Autumn. Jamaica. Syn., *Eranthemum coccineum* and *Salpiscantha coccinea*. B. M. t. 4158.
 — *fulgida*. Scarlet. August. W. Ind. 1804.
 — *longiflora*. 3. Scarlet. July. Brazil. 1826. B. R. t. 1045.

Geissorhi'za. Tile Root. (From *geisson*, a tile, and *rhiiza*, a root; referring to the dry coats which cover the fleshy roots like tiles on a roof. Nat. ord., *Iridææ*; Tribe, *Iziææ*. Allied to *Trichonema*.)

Half-hardy bulbs, from South Africa. Except when planted out on a border, in front of a greenhouse, or in frames, the roots should be planted in a handful of white sand; offsets; sandy peat, with a little loam; must be kept from the frost in winter.

- G. cilicaris*. 1. May.
 — *erecta*. See *Hesperantha*.
 — *exaltata*. ½. White. May. 1789.
 — *grandis*. 1. Straw, crimson. May. S. Africa. 1866. B. M. t. 5877.

 — *setacea*. 1. Sulphur. July. 1809. B. M. t. 1255.
 — *subulata*. 1. Yellow. May. 1825.
 — *vaginata*. Swt. Fl. Gard. t. 138. See *G. inflexa*.

Geitonople'sium. (From *geiton*, a neighbour, and *plesion*, near; alluding to its affinity with the genus *Eustrephus*. Nat. ord., *Liliaceæ*; Tribe, *Luzuriageæ*.)

Greenhouse climber. For cultivation, see *EUSTREPHUS*.

- G. cymosum*. Green. New Holland. 1832.

Ge'la. (From *geleo*, to shine; referring to the surface of the leaves. Nat.

ord., *Rutaceæ*.) By some authorities united to **Acronychia**.

Greenhouse evergreen shrubs. Cuttings of half-ripened shoots in May, under a hand-light, in sandy soil; sandy peat.

G. lanceolata. 4. Yellow. Cochinchina. 1820.
— *oblongifolia*. See *Ximelia oblongifolia*.

Gela'sine. (From *gelasinos*, a smiling dimple; referring to the flowers of these pretty bulbs. Nat. ord., *Iridææ*; Tribe, *Sisyrinchieæ*. Allied to *Nemastylis*.)

A bulb, from the Rio Grande in South America, almost, if not altogether, hardy; but *Trichone'ma*, so well known, will give a good idea of it; light, sandy soil suits it best. It seeds freely, and seedlings flower the second season from the sowing, and, like most Irids, they increase by offsets.

G. azurea. 1. Blue. May. S. Amer. 1838.
B. M. t. 3779.

Gelse'mium. (From *gelsemius*, an Italian name of the Jasmine; alluding to the similarity of the flowers. Nat. ord., *Loganiaceæ*; Tribe, *Gelsemieæ*.)

A hardy climbing shrub, commonly called Carolina Jasmine. Cuttings under a hand-glass. Rich loam.

G. nitidum. Yellow. June. N. America. 1840.
Bentl. and Tr. t. 181.

Genetyllis. (From *genetyllis*, protective of birth; alluding to the form and position of the flowers. Nat. ord., *Myrtaceæ*.) Now united to **Darwinia**.

Greenhouse evergreens. Cultivated like the Myrtle.

G. fimbriata. B. M. t. 5864. See *Darwinia fimbriata*.

— *fuchsioïdes*. 3. Scarlet. 1855. L'Hort. Fr. 1864, t. 15. Syn., *Darwinia Hookeriana*.

— *macrostegia*. 2. Crimson. May. Western Australia. 1854. Syn., *Darwinia macrostegia*.

— *tulipifera*. 2½. Straw, crimson. April. Swan River. 1854. B. M. t. 4558. Syn., *Hedera-roma tulipifera*.

Geni'pa. Genip-tree. (From *Genepapa*, the native name. Nat. ord., *Rubiaceæ*; Tribe, *Gardenieæ*. Allied to *Gardenia*.)

The Genipap, a South American fruit, is produced by *G. americana*; it is as large as an orange, and much esteemed. Stove evergreen trees. Cuttings of shoots just getting a little firm, in May, in sand, under a bell-glass, and in bottom-heat; peat and loam, with a little sand and cow-dung.

G. americana. 30. Pale yellow. S. Amer. 1779.

— *edulis*. Synonymous with *Alibertia edulis*.

— *esculenta*. 20. China. 1823.

— *Meriana*. 10. White. Cayenne. 1800.

— *oblongifolia*. 20. Yellow. Peru. 1821.

Geni'sta. (An old Latin name used by Virgil. Nat. ord., *Leguminosæ*; Tribe, *Genistææ*. Allied to *Spartium*.)

Low shrubs, all with yellow flowers. The greenhouse and half-hardy kinds like peat and loam, with a little sand and leaf-mould, and are propagated by cuttings of the young shoots in summer, in sand, under a bell-glass. The hardy kinds are easily increased by seed, and the most

rare by cuttings under a hand-light, after April, in a shady place. Whatever plan is adopted, they should be frequently transplanted, or at once removed to their position in the shrubbery, as they make long, naked roots. *Canarie'nsis* is about the best of the greenhouse ones, and that in a dry place requires only a little protection out of doors. *Lusit'nicæ* and *radia'ta* look interesting even in winter, when the leaves are gone. *A'nglica* is the rough-looking spring dwarf-bush that blooms so freely in our moist moors. *Tinc-to'ria* is used in all its parts for producing a yellow dye; and on a rock-work, or on the top of a mound, with its branches allowed to creep downwards, few things in spring and the beginning of summer are more splendid than the trailing *triquetra*, and its next-door neighbour, *triangularis*. Common, loamy soil suits all the hardy ones.

GREENHOUSE DECIDUOUS.

G. congesta. 4. June. Tenerife.
— *monosperma*. 4. July. South Europe. 1690.
B. R. t. 1918. Hardy against a wall in the South of England.
— *sphaerocarpa*. See *Retania sphaerocarpa*.

Gentiana. Gentian. (Named after *Gentius*, king of Illyria, who first experienced the virtue of Gentian. Nat. ord., *Gentianaceæ*; Tribe, *Swerticeæ*.)

The root of *G. lutea* is the true Gentian of the druggists, an intense bitter, only exceeded by that of *Aletris farinosa*, a little North American Bloodroot, the most intense bitter known, and by *Quassia amara*. All may be propagated by seed sown as soon as ripe; the perennials, also, by division in spring. Some of the creeping, low-growing kinds, as *acaulis*, make nice edgings to walks and borders. The rarer species require light sandy peat, and all should be periodically raised from seeds.

HARDY ANNUALS.

 — *fucatum*. 1. Pink. July. Ceylon. 1832. B. R. t. 1687.

Geoffræa. Bastard Cabbage-tree. (Named after *Br. Geoffroy*, of Paris, author of "Materia Medica." Nat. ord., *Leguminosææ*; Tribe, *Dalbergiææ*. Allied to *Andira*.)

Stove evergreen trees. Cuttings of ripened shoots in sand and peat, and under a bell-glass; peat and loam.

- G. Bredemeyeri*. See *G. superba*.
 — *inermis*. See *Andira inermis*.
 — *racemosa*. See *Andira racemosa*.
 — *spinos*. 30. Yellow. New Grenada. 1818.
 — *superba*. Yellow. July. Caraccas. 1824. Syn., *G. Bredemeyeri*.
 — *violacea*. 20. Violet. Guiana. 1823.

Geoffroya. See *Geoffræa*.

Geometra. The *Amphidasis* and *Hybernaria* of some entomologists form a genus of moths including *G. polosaria*, Pale Brindled Beauty-Moth, which appears in March; eggs deposited in bands round a twig, as done by the Lackey-Moth. Caterpillars appear with the opening leaves of the elm, lime, lilac, and apple-tree. They are at first, a light green.

G. defoliaria, Lime-Looper, or Mottled Umbre-Moth, feeds on the leaves of the lime and apple. Moth appears in November. Caterpillar reddish, with a bright yellow stripe on each side. Female moth has no wings, so that a piece of cloth dipped in tar, and bound round a tree's stem, prevents its ascent.

G. pinaria attacks the pine and fir tribe.

Geonoma. (From *genomos*, skilled in agriculture; as much as to say that only a skilful planter could increase these palms. Nat. ord., *Palmeææ*; Tribe, *Areceææ*.)

Stove palms. Seed; rich, sandy loam.

 — *undata*. Venezuela. 1850.
 — *Verschaffeltii*. See *Calyptrogyne Ghiesbreghtiana*.
 — *zamorensis*. Peru. 1869.

Georchis. See *Goodyera*.

Georgina. Attempts were made some years since to substitute this name for that of *Dahlia*; but the law of priority settles the question. *Dahlia* was named by the Spanish botanist Cavanilles in 1791; and neither *Wilde* nor *Sprengel's* *Georgina* appeared for more than eighty years subsequently. *G. variabilis* is a synonym of *Dahlia variabilis*.

Geranium. Crane's Bill. (From *geranos*, a crane; referring to the beak-like torus, or projection beyond the seeds. Nat. ord., *Geraniaceæ*; Tribe, *Geraniæ*.) See also **Pelargonium**.

The name *Geranium* has often been used in gardens and garden literature to include numerous plants belonging to the genus *Pelargonium*. The differences between these two genera may be stated thus:

Geranium.—Flowers regular, without a spur. Stamens, ten.

Pelargonium.—Flowers irregular, rarely sub-regular. Posterior sepal, with a spur united to the pedicel. Stamens, five or fewer.

A very few require the pit or greenhouse in winter, and these should have equal portions of peat, loam, leaf-mould, and sand. Almost all are hardy, and flourish in common ground; many grow under the shade of trees and hedges, and thus secure a portion of vegetable earth. There are worse things than the common weed *Robertia num* for twining itself round the sides of a rustic basket, or crawling over a rock-work. The following are a few of the best for gardens:—*sylda ticum*, *arne num*, *sanguineum*, *lanceolatum*, *Wallichia num*, *prate nse flo-re-ple no*, *dahuricum*, *pilosum*, and *cristatum*, etc.

HALF-HARDY HERBACEOUS.

Gerardia. (Named after *Gerard*, the English herbalist. Nat. ord., *Scrophulariaceæ*; Tribe, *Gerardiæ*. Syn., *Dasytoma*.)

All but *delphinifolia* from North America. Annuals, biennials, and perennials by seed, in sandy peat; perennials and biennials also by cuttings in sandy peat, under a hand-light; such as *quercifolia*, by divisions in spring; sandy, fibry loam, if peat is not to be had; the stove species require similar treatment, but extra heat.

STOVE HERBACEOUS.

G. delphinifolia. See *Sopubia delphinifolia*.

HARDY ANNUALS AND BIENNIALS.

G. afzelii. See *Seymeria tenuifolia*.

Gerbera. (Named after *Gerber*, a German naturalist. Nat. ord., *Compositæ*; Tribe, *Mutisiaceæ*.)

Greenhouse perennials, seeds or cuttings of the side-shoots, and preserved over the winter; sandy loam and a little peat. Winter temp., 40° to 45°.

- G. crenata*. B. R. t. 855. See *Mairea crenata*.
 — *Jamesoni*. Rich orange-scarlet. Natal. 1889. B. M. t. 7087.

German Catchfly. *Viscaria vulgaris*.

Germander. *Teucrium*.

Germination is the sprouting or first step in vegetation of a seed. To enable it to germinate it must have a perfectly-developed embryo, and be ripe, or nearly ripe. It must not be too old, and there must be present a certain degree of heat, moisture, and oxygen gas, the latter being furnished by the air.

Gero'pogon. Old Man's Beard. (From *geron*, old man, and *pogon*, a beard; referring to the hair-like pappus which crowns the calyx in this order. Nat. ord., *Compositæ*; Tribe, *Cichoriaceæ*. Now united with **Tragopogon**.)

Hardy plants, from Italy. Annuals by seed in April, in common soil; perennial by seed and division of the plant in spring.

- G. calyculatus*. See *Scorzonera hirsuta*.
 — *glaber*. B. M. t. 479. See *Tragopogon glaber*.
 — *hirsutus*. Sibth. Fl. Gr. t. 778. See *Tragopogon hirsutus*.

Gerrarda'nthus. (From *Gerrard*, a collector in Natal, and *anthos*, a flower. Nat. ord., *Cucurbitaceæ*; Tribe, *Zanoniæ*.)

A greenhouse climber. Sandy loam. Seeds. *G. tomentosus*. Yellow. August. Natal. 1874. B. M. t. 6694.

Gesnera. (Named after *Conrad Gesner*, a celebrated botanist of Zurich. Nat. ord., *Gesneraceæ*; Tribe, *Gesnerææ*. Allied to *Gloxinia*.)

A most interesting family of plants, that, by regulating their rest period, may be brought into bloom at almost any time. All scarlet-flowered, except where otherwise stated.

- G. acapulcoensis*. 1. June. Jamaica. 1793.
 — *aggregata*. 3. June. Brazil. 1816.

Propagation: by Cuttings.—They may be propagated by cuttings of three kinds. 1st, the young shoots, as soon as they are three inches long, springing from the old tubers (these are the best); 2nd, leaves taken off with a bud at the base; and 3rd, by the leaves only, with-

out buds. The first mode may be used when the kind or variety is plentiful, and the bulbs so strong as to send out more shoots than are wanted for flowering; the second mode, when the variety is new and more scarce; and the last when it is more rare still. There is an advantage in the first and second mode, that the cuttings, if struck early in the year, will, with moderate care and attention to repotting, flower the same year; whereas those struck from leaves, or parts of leaves, will only form small tubers that season. Each kind of cutting requires to be put in sand, under bell or hand-glasses, in bottom-heat, to strike them quickly. A moist, warm heat is necessary; a moist, cold place would rot the cuttings immediately. Such species as do not make tubers must be propagated by cuttings.

By Seed.—To raise new varieties it is necessary to save seed. Choose the finest and brightest-coloured to save it from. As soon as it is ripe, gather it and dry it; keep it very dry till the March following; then sow the seed on the surface of a light, sandy compost, place it in a warm, moist atmosphere, and as soon as the seedlings are up, and the plants have attained a leaf or two, transplant them thinly on the surface of shallow pots, and let them grow there during the summer. Allow them to go to rest in the autumn, and keep them in the same pots through the winter, giving but little water. As soon as life appears again in the spring, pot them off singly into small pots, watering and re-potting the same as the cuttings; but it is more than probable they will not flower till the second year.

Soil.—Light, fibrous loam, turfy peat, and half-decayed leaves, in equal parts, with a due portion of sand, well-mixed, but not sifted.

Summer Culture.—To have a succession of bloom, pot a portion of the bulbs in January, and place them in heat, giving a little water. Temperature, 60° to 80°. Pot a second batch about the middle of February, and another towards the end of March. These will supply flowers for several months. Put them in pots, according to the size of the bulbs; keep them regularly watered, but never very wet. They may be syringed occasionally previously to flowering, but not much; for the leaves are so woolly that they hold moisture too long, if syringed severely. When the blooming season is over they may be set out of doors during summer, but

should be sheltered from heavy rains. They will then gradually go to rest.

Winter Culture.—All that they require is to be kept in their pots in a place where neither frost nor wet can reach them; yet the place should never be below 45°, nor above 55°. If the cold is much lower they will be apt to rot; and if higher, to start into growth.

Diseases.—The only disease that these plants are subject to is a kind of dry rot in the bulbs, which changes the substance into a soft pulp, destroying the buds, and so causing them to perish. There is no cure for it.

Gethyllis. (From *getheo*, to rejoice; referring to the sweetness of the flowers of some of them. Nat. ord., *Amaryllidæ*; Tribe, *Amaryllæ*. Allied to *Sternbergia*.)

Here the Amaryllids reach their minimum stature; *G. ciliaris*, if not the smallest, is as dwarf as any in the order. There are only a few of them in cultivation. Greenhouse bulbs, from Cape Colony, with white flowers. Offsets and seeds; sandy loam and peat; kept nearly dry in winter.

- G. a'fra*. $\frac{1}{2}$. White, flushed with red outside. August. 1820. B. R. t. 1016.
- ciliaris*. $\frac{1}{2}$. White. July. 1788. Jacq. H. Schœnb. t. 79.

Gilibertia. (Named after Gilibert, a German botanist. Nat. ord., *Araliaceae*. Allied to *Cussonia*.)

Stove evergreen shrubs. Cuttings of the young shoots in sand, under a bell-glass, and in heat; sandy peat and fibry loam.

- G. brasiliensis.* 4. Greenish. Tropical America.
- *palmeta.* See *Trevisia palmata.*
- *umbellata.* Greenish. Peru. Syn., *Dendropanax umbellatum.* Rev. Hort. 1854, p. 107.

Gillenja. (Named after one Gillenius. Nat. ord., *Rosaceae*; Tribe, *Spiræe*. Allied to *Exochorda*.)

Hardy herbaceous perennials, with red and white flowers, from North America. Division of the plant seed; common soil.

- G. stipulacea.* 2. July. 1805.
- *trifoliata.* 2. July. 1713. Syn., *Spiræea trifoliata.* B. M. +
- *major.* 3. July.

Gilliesia. (Named after Dr. Gillies of Mendoza. Nat. ord., *Liliaceae*.)

Showy greenhouse, or half-hardy bulb. Sandy loam.

- G. graminea.* 1. Greenish. September. Valparaiso. 1825. B. R. t. 992.

Gilliflower, Gilloflower, or Gillyflower. Corrupted from the French Giroflée, and applied to *Dianthus Carophyllus*, *Matthiola incana*, and *Cheiranthus Cheiri*.

Ginger. (*Zingiber officinale*.) Green ginger may be easily cultivated two ways, either in pots, or in a deep pit. If in pots, take the plants, shake them out of the pots when at rest in February, divide them, and pot each piece into a pot six inches across; plunge them, as soon as the heat is temperate, in a bark-pit, or a frame heated with dung like a cucumber-bed, the surface being covered with tan deep enough for the pots. As soon as the plants come up give a small supply of water, gradually increasing the quantity as the plants advance in growth. By August they will be fit to take up and preserve. If a large quantity is required, a deep pit of two or three lights will be necessary, the bottom to be filled with rich soil to the depth of a foot; plant the roots in this soil, and line the pit with hot dung, renewing it as the heat declines. The time for planting in the pit is February or March. Water whilst growing, give air in hot weather, and in September you will have a large supply of fine ginger-roots, equal to foreign.

Ginger Beer Plant. A microscopic fungus, allied to yeast (*To'ru'la*).

Ginger Bread Palm. *Hypphaene thebaica*.

Ginger Bread Plum. *Parinarium macrophyllum*.

Gi'ngo. The Maiden-hair Tree. (The Japanese name. Nat. ord., *Coniferæ*. Syns., *Pterophyllus* and *Salisburia*.)

Ornamental hardy trees of handsome appearance. Seeds, common soil.

- G. biloba.* 80. Spring. N. China. 1754. Syn., *Salisburia adiantifolia.*
- *laciniata.* Leaves deeply cut.
- *pendula.* Branches drooping.
- *pyramidalis.* Garden variety. 1838.
- *variegata.* Leaves slightly variegated.

Gipsy Moth. *Li'paris dispar*.

Githa'go. See *Lychnis*.

Gladiolus. Corn Flag. (From *gladius*, a sword; referring to the shape of the leaves. Nat. ord., *Iridæe*; Tribe, *Iaviceæ*.)

- Bulbs, from South Africa, except where otherwise mentioned. The hardiest merely require border-room, and are propagated by seeds, and by taking up and dividing the rhizomes or bulbs before growth has commenced. Those generally designated frame and greenhouse species will thrive very well in dry, sandy loam and peat out of doors, if planted from six to ten inches deep, according to the strength of the bulbs. The earliest-flowering, such as *bla'ndus*, etc., may be planted in the end of October; *ramo'sus*, *formo'sissimus*, etc., in December; and *Gandave'nsis*, *floribu'ndus*, *psittaci'nus*, and *sple'ndens* from February to March, when they will keep blooming all the autumn. The whole make fine pot plants, potted in autumn and spring, and kept in a cold pit until they show flower. They may also be forced for the greenhouse after the roots have filled the pots.

Propagation: by Offsets.—The offsets are produced plentifully round the base of each bulb. When the bulbs are taken up, separate the flowering bulbs from the offsets, and then again divide the latter into two lots, one of the larger roots and one of the smaller. Towards the end of August prepare a bed for them in an open situation, and drain the ground well if damp. Place a layer of brick-rubbish under the soil, not less than a foot deep, and not more than fifteen inches; upon the drainage place a layer of stable-litter, then throw in the soil, mixing it freely with well-decomposed manure; let it settle about a fortnight, then plant the larger offsets in one bed and the smaller ones in another; the larger sized four inches apart in the row, six inches from row to row, and three inches deep. Plant by drawing drills across the beds with a triangular-shaped hoe, and put in the bulbs with the hand, pressing each pretty firmly down into the soil. When all are planted, level the soil with a rake. The small-sized offsets may be planted much thicker, but in every other respect the same as the larger sized. The reason for planting them in two sizes is, because the larger sized produce such

large leaves as smother the smaller ones; besides, the larger sized will produce, after one year's growth, flowering bulbs, which, when taken up after the growth is perfected, may be sorted to plant with the older flowering ones. The smaller size had better remain in the bed for two years, then be taken up, sorted, and replanted in two sizes again, till they are large enough to flower.

By Seed new varieties are obtained. All that is wanted are a few square yards of ground, a few roots of the best kinds, but as dissimilar in habit as possible, and then, when in bloom, to exercise a little taste and discernment in hybridizing, by impregnating the finest form as the breeder of seed, with the pollen of the highest and most distinct coloured male parent, removing the pollen of the breeder before it bursts, and applying the pollen of the male parent as soon as the anthers open. When the seed is ripe gather it, and keep it dry till spring; then sow it in shallow pots or boxes; place them in a gentle heat, and when the seedlings are up give plenty of air, and very moderate supplies of water. As soon as the weather will permit, set them in the open air, and as the leaves advance in size give more water, and allow gentle showers to fall upon them, but shelter them from heavy rain. When the leaves are all decayed, take the soil and carefully sift it through a fine sieve, picking out every bulb, however small. Prepare a bed in the same manner, and of the same materials, as is described above for offsets. Plant the seedling bulbs in it the first week in September, in the same way as the small offsets. Let them remain in this bed for two years; then take them and replant them in a bed fresh prepared. It is likely that some of the strongest will then flower, and the very worst will be worth planting in the borders.

Summer Culture.—The bulbs want very little attention during summer. Keep them clear of weeds, and when the flower-stems are a foot high place a stick to support them, as the winds are apt to twist them off close to the bulbs. When the bloom is over, and the leaves turn yellow, take them up dry, and sort them, separating the bulbs that are large enough to flower from the offsets; put them away in drawers marked with the name of each variety, keeping them dry and cool till the planting season arrives again.

Winter Culture.—In September pre-

pare the beds by throwing out all the soil to the depth of fifteen inches; if in the same situation as beds were before, examine the drainage. If it is open and ready to work well, it will need nothing doing to it, but if it be choked up, remove it entirely; sift it, throwing in the rough, and removing the fine earthy part; add some fresh rubble, and then cover it with litter; mix a goodly portion of thoroughly decayed dung with the soil, or, which is better, renew it entirely; level the bed, leaving it a few inches higher. Plant the first week in October, three inches deep, giving each of the bulbs six inches square to grow in. Place a thin layer of half-rotten dung upon the bed, to protect the bulbs in severe frost. They will require no other care during this season.

Vermin.—Mice, wireworms, and the red spider prey upon them. *Wireworms* may be caught with slices of potatoes buried in the soil, and taken up occasionally. The *red spider*, happily, only appears when there is a long continuance of dry weather. Watch for its first appearance, and as soon as it is perceived, causing the leaves to be spotted, let every leaf be sponged over with water impregnated with flower of sulphur. If dry weather prevails much, syringe the plants every evening severely:

Gladiolus disease. In wet seasons, especially in damp heavy soils, the Gladiolus is subject to a peculiar disease, caused by some fungus. At present the disease is very imperfectly understood, for badly diseased corms are often found to contain the mycelium of two or three kinds of fungi, as well as infusoria. A curious mycelial growth is, however, usually found in the diseased corms, called *Rhizoctonia crocorum*, or "Copper-web," which also attacks and destroys the corms of Crocus, Narcissus bulbs, Asparagus, etc., and probably is the main agent in producing the Gladiolus disease. The fruit of this fungus is unknown, but in 1876 Mr. W. G. Smith discovered some curious bodies

in a diseased Gladiolus corm which may perhaps prove to be the fruit of *Rhizoctonia*; no mycelium was, however, found with them. These bodies, one of which is shown in our engraving, belong to

the genus *Urocystis*, and have received the name of *U. gladioli*; they are com-

pound spores, consisting of from three to six inner brown cells or spores, and an indefinite number of outer nearly transparent cells. Both kind of cells or spores burst and produce threads of mycelium. No remedy is known.—From the "Gardeners' Chronicle," 1876, n. s. vi. 420.

Glass is the best agent employed by the gardener to exclude the cold, whilst the light is admitted to his plants which are natives of hotter climates than that in which he cultivates them. Now that the excise-duty is removed from glass, the gardener is enabled to employ the best, and a thicker kind than formerly, when the duty was high in proportion to the good quality and weight. Anxiety to obtain the best glass for hothouses, etc., is every way laudable; but the benefit sought for is frustrated if it be not constantly well cleansed. The best glass, if dirty, allows fewer rays of light to pass through than inferior glass kept bright. A thorough cleansing should be given both to the outside and inside twice annually, during the first weeks of February and of October, and a third cleansing, on the outside only, at the end of June. In proportion to the deficiency of light does the plant under glass become, in the gardener's phraseology, *drawn*; that is, its surface of leaves becomes unnaturally extended, in the vain effort to have a sufficient elaboration of the sap effected by means of a large surface exposed to a diminished light, for which a less surface would have been sufficient if the light were more intense. Taking into consideration the consequences of breakage, and other contingencies to be avoided as well as secured, we consider glass of 21 ounces to the square foot, and in panes of 18 inches by 12 inches, the substance and size most desirable. Rough plate-glass is desirable, because, without diminishing the light, it reduces the danger of scorching the leaves.

Glass Cases are of various kinds. One is formed of glazed wooden frames, fitting together, to protect espaliers, wall-trees, or shrubs, too large to be covered with a hand-glass.

Another glass case is made for protecting a single branch. It is thus described by Mr. Maund:

"Grapes grown on open walls in the midland counties are rarely well ripened; therefore I provide a small glazed frame, a sort of narrow hand-glass, of the shape shown in the annexed outline, to fix against the wall, and inclose one branch

of the vine, with its fruit and foliage. The open part, which rests against the wall, is thirteen inches wide, and may be of any length required to take in the fruit. The sides are formed of single panes of glass, seven inches wide, and meet on a bar which may represent the ridge of a roof, the ends inclosed by triangular boards, and having a notch to admit the branch. This is fixed on the branch a month before the vine is in flower, and brings it a week earlier than the exposed. The frame is not fitted closely to the wall, but in some

places may be a quarter of an inch from it. The lateral branches being shortened before it is fixed, it does not require removal even for pruning, because I adopt the long-rod mode of training, which is peculiarly adapted to my *partial protection system*. The temperature within the frame is always higher than without, sometimes at mid-day even from 20° to 30°. By this simple protection I find grapes may be ripened from three weeks to a month earlier than when wholly exposed, and this saving of time will, I believe, not only secure their ripening well every year in the midland counties, but also that such advantage will be available in the north of England, where grapes never ripen on the open walls."

Lastly, there is the so-called *Wardian case*, to cover plants growing in rooms, preserving to them uniform moisture, and excluding dust. To prevent the dew which is occasionally deposited inside the glass, it is only necessary to open the case frequently, for a few minutes, to render the temperature within similar to that outside. They are not intended to exclude the air, and are now made very ornamental.

Glastonbury Thorn. A variety of *Crataegus oxyacantha*.

Glasswort. *Salicornia*.

Glau'cium. Horn Poppy. (From *glaukos*, greyish-green; referring to the colour of the leaves. Nat. ord., *Papaveraceæ*; Tribe, *Eupapavereæ*. Allied to *Eschscholtzia*.)

Seeds in common borders, in March or April.

HARDY BIENNIALS.

Globu'lea. (From *globulos*, a small globe; referring to glands on the petals. Nat. ord., *Crassulaceæ*. United to *Crassula* by Bentham and Hooker.)

Greenhouse succulents, from the Cape of Good Hope, and with white flowers, except *a'tro-purpurea*. Cuttings of firmish young shoots, taken off and dried for a day or two before inserting them in sandy soil, and placing a hand-light over them, but not close. Sandy loam, a little peat, charcoal, and brick-rubbish, in small pieces, the dust being sifted out. Keep dry during winter.

- G. a'tro-purpu'rea*. ½. Purple. August. 1823.

Glo'nera. See *Psychotria*.

Glorio'sa. (From *gloriosus*, glorious; referring to the flowers. Nat. ord., *Liliaceæ*; Tribe, *Uvulariæ*.)

Stove bulbs, except *nepale'nsis*. Divisions of the roots and seeds; if by the former, take a pot that has been kept dry all the winter, say in March, turn it out, and separate the bulbs carefully, without bruising them. Place each bulb, with the end farthest from the old tuber, uppermost in the centre of a clean pot, covering it with an inch or two of soil, the pot being five or ten inches, or any intermediate size, in diameter, according to the size of the bulb; peat, loam, leaf-mould, old cow-dung, and sand in equal proportions, with good drainage. Give no water until the bud appears above ground, then water and place in a strong, moist heat, growing vigorously, and training as the plant proceeds. When it has done flowering, and the leaves turned yellow, refrain from watering, and shortly after turn the plants on their broadsides in a dry place, and allow them to rest until next season.

- G. nepale'nsis*. 2. Yellow. June. Nepaul. 1825. Half-hardy.
 — *si'mplex*. 2. Blue. July. Senegal. 1756.

— *Notonia*'na. See *Klugia Notoniana*.
— *zeylanicus*. See *Klugia zeylanica*.

Glossoc'onia. (From *glossokomos*, a money-bag; referring to the shape of the flower. Nat. ord., *Campanulaceæ*; Tribe, *Campanuleæ*.) See **Codonopsis**.

G. ovata. B. R. 1842, t. 3. See *Codonopsis ovata*.
— *lurida*. See *Codonopsis rotundifolia*, B. M. t. 4942.

Glossod'ia. (From *glossa*, a tongue, and *eidos*, like; referring to the lip, or labellum. Nat. ord., *Orchideæ*; Tribe, *Neottieæ-Diurideæ*. Allied to *Arethusa*.)

Greenhouse terrestrial orchids. Offsets; sandy loam and peat; dryish in winter.

G. major. Blue. June. Australia. 1810.
Syn., *Caladenia major*.
— *minor*. Blue. June. Australia. 1810.
Syn., *Caladenia minor*.

Glottid'ium. (From *glottis*, the valve of the windpipe; referring to the division in the seed-pod. Nat. ord., *Leguminosæ*; Tribe, *Galegeæ*.) See **Sesbania**.

G. florida'num. See *Sesbania disperma*.

Gloxinia. (Named after P. B. Gloxin, a botanist of Colmar. Nat. ord., *Gesneraceæ*; Tribe, *Gesnereæ*.)

Very handsome stove herbaceous perennials. For culture, see **GESNERA**.

G. caulescens. 3. Purple. July. Pernambuco. 1828. B. R. t. 1127.

— *digitaliflora*. 3. Pale crimson. June. Mexico. 1843. Paxt. Mag. x. p. 198.

— *tubiflora*. 1. White. July. South Brazil. 1837. B. M. t. 3971. Now referred to *Achimenes*.

— *virginale*. Garden variety. 1889.

Gly'ce. (From *glukus*, sweet; alluding to its flavour. Nat. ord., *Crucifereæ*. Now referred to **Alyssum**.)

G. mari'tima. Synonymous with *Alyssum maritimum*.

Gly'cine. (From *glukus*, sweet; referring to the taste of the roots of some Nat. ord., *Leguminosæ*.)

The well-known Chinese twiner, popularly called *Gly'cine sinensis*, belongs to *Wistaria*. Seeds in a hotbed, in spring; cuttings of young side-shoots in spring, in sand, under a bell-glass; peat and loam, with silver sand.

STOVE EVERGREEN TWINERS.

G. Bachtousia'na.

— *hedysaroides*. 1½. Purple. July. Guinea. 1823. Shrub.

— *rosea*. 1. Rose. Ceylon. 1848.

GREENHOUSE EVERGREEN TWINERS.

G. claudes'tina. 2. Purple. July. Australia. 1818. Syn., *G. minima*.

B. M. t. 2150.

— *uralen'sis*. 3. Pale blue. July. Siberia. 1818.

Glycyrrh'iza gla'bra Culture.

Common Liquorice.
Soil and Situation.—It thrives best in a rich, light soil, two or three feet deep, which should be trenched completely to the bottom before planting, and a little

well-decomposed manure turned in with the bottom spit. In shallow or poor ground it will not succeed: the situation cannot be too open.

Planting.—It is propagated by cuttings of the side-roots, which spring from the crown of the plants, and run horizontally just beneath the surface. Plant in February, or early in March. Each set, having a bud or two, should be about two inches beneath the surface. The only cultivation they require is to be frequently hoed, and in autumn the decayed stalks to be cut down, and the earth stirred between the rows.

The roots are not fit for use until of three or four years' growth. The season for taking them up is December, January, or February. A trench must be dug up regularly along each row, quite down to the extremity of the principal roots, which descend two feet and more.

Glyphæ'a. (Derivation unexplained.) Nat. ord., *Tiliaceæ*; Tribe, *Apeibeæ*.)

Stove shrub. For cultivation, see APEIBA, to which it is allied.

G. Monte'roi. Yellow. Benguela. 1866. B. M. t. 5610.

Glyphospérma. (From *glyphe*, carving, and *sperma*, a seed.) Nat. ord., *Liliaceæ*; Tribe, *Asphodeleæ*. Closely allied to *Anthericum*.)

Hardy plant with grass-like leaves, requiring slight protection in winter. Sandy soil.

G. Palmé'ri. 1½. Light salmon-colour, or white. February. Northern Mexico. 1881. B. M. t. 6717.

Glyptostro'bus. See *Taxodium*.

Gmeli'na. (Named after *G. Gmelin*, a German naturalist.) Nat. ord., *Verbenaceæ*; Tribe, *Viticeæ*. Allied to *Tectona*.)

Evergreen trees. Seeds; cuttings of firm young shoots in sand, and in heat; rich, fibry loam.

G. asiá'tica. 10. Yellow. E. Ind. 1792. Stove.
— *Rhee'dii.* 14. Orange. May. E. Ind. Stove. B. M. t. 4395.

Gompholo'bium. (From *gomphos*, a club, and *lobos*, a pod; shape of seed-vessel. Nat. ord., *Leguminosææ*; Tribe, *Podalyriææ*.)

Greenhouse evergreens, from Australia. Cuttings of young shoots, about two inches in length, in sand, under a bell-glass, in a shaded place, in April or May; peat and loam in little fibry pieces, with rubby charcoal, potsherds, and silver sand; drainage must be well attended to, as saturated soil is their ruin. All have yellow flowers, except where otherwise mentioned.

Gonioscypha. (From *gonia*, an angle, and *scyphos*, a cup; referring to the bracts at the apex of the inflorescence. Nat. ord., *Liliaceæ*.)

Stove or greenhouse perennial. Sandy loam; seeds.

G. eucomoides. 1. Dull green. Bhotan. G. C. 1886, xxvi. p. 744.

Gonocalyx pulcher, is probably a species of **Ceratostemma**. It is a beautiful greenhouse shrub, with bright rose-coloured flowers, and was introduced from Columbia in 1858.

Gonolobus. (From *gonia*, an angle, and *lobos*, a pod; referring to the shape of the seed-vessel. Nat. ord., *Asclepiadaceæ*; Tribe, *Gonolobæ*.)

The hardy species by seeds and divisions, in dry, sandy soil. The greenhouse and stove species by divisions by seed in heat, and by cuttings of the young shoots in sand, under a bell-glass. The stove kinds require bottom-heat; peat and loam, with silver sand, and a little dry cow-dung.

G. Domini and *G. Veitchii* are garden hybrids.

Gooseberry. *Ribes grossularia*.

Varieties.—*General Dessert Kinds.*

The letters R. Y. G. W. refer to the colours, red, yellow, green, white.

— Champagne, R. and Y.; Early Green, hairy, G.; Golden Drop, Y.; Rockwood, Y.; Pitmaston Green-Gage, G.; Warrington, or Aston Seedling, R.; Taylor's Bright Venus, W.; Whitesmith, W.; Glenton Green, G.; Walnut, G.; Early Sulphur, Y.; Massey's Heart of Oak, G.; Wellington's Glory, W.; Rumbullion, Y.

Late Dessert kinds (for retarding on trellises).—Warrington, R.; Pitmaston Green-Gage, G.; Coe's Late Red, R.; the Champagnes, R. and Y.

Bottling.—Rumbullion, Y.

Preserving.—Rough Red, Warrington, Champagne.

Large kinds (very good).—Prince Regent, R.; Wonderful, R.; Roaring Lion, R.; Top Sawyer, R.; Rockwood, Y.; No Bribery, Y.; Sovereign, Y.; Wel-

lington's Glory, W.; Queen Charlotte, W.; Greenwood, G.; Glenton Green, G. There are many new sorts that do well in particular localities, and these should be selected with great care.

Propagation: by Cuttings.—Large straight, and healthy young shoots should be procured at the end of autumn, and these may be shortened to about fifteen inches in length, cutting away the weaker portion—the point. All the eyes or buds must be *cut out*, except the four top ones, in order to prevent the future plant from producing suckers. These should be planted in any ordinary garden-soil, in a light situation, but not too sunny. Plant about four inches deep, and keep them tolerably moist during spring and early summer. Cuttings of young growing shoots, also, strike readily under a glass.

Layering is performed as with other deciduous shrubs; if in the old wood, at the same period as the cuttings, and for the same reasons; if in the young shoots, when they have acquired some strength, about the beginning of July.

Seed.—This is the source whence new varieties may be obtained. The seed being washed out of the pulp when ripe, may be sown immediately; and in the ensuing spring, if the plants can be early subjected to a slight bottom warmth, they will be a foot in height in the first summer, and may, with good management, be brought to bear, some in the second year, and all in the third.

Soil.—A deep, sandy loam is best adapted to the gooseberry. Any free garden-soil, of average quality, will produce them in tolerable perfection, if well manured, and, above all things, freed from excess of moisture. Gooseberries will never thrive in stagnant soil; they will become hide-bound speedily, and their stems covered with moss. Nevertheless, they are very partial to a permanency of surface moisture in the growing season, and for that purpose top-dressings are had recourse to. Wherever fine gooseberries are required, the situation must be totally unshaded; it, however, becomes good policy at times to plant some under the partial shade of small trees. In such situations they will set in a frosty spring, when those exposed are cut off.

Culture in Growing Period.—A due training, especially whilst young, is necessary. Those who grow them for exhibition use two sorts of sticks, viz., forks and hooks. These are cut out of any ordinary brush-wood, about half a yard long, and they must be neatly

pointed. Thus the hooks are made to draw down refractory shoots, and the forks to prop up the drooping ones. It is a good practice to apply a top-dressing of half-rotten manure in the beginning of May; and just before the fruit has completed its last swelling, the points of all the longest straggling shoots may be pinched or dubbed. It is well to go over the bushes in the early part of June, and remove much of the waste spray which chokes the interior of the bush. Some of the grosser shoots may be entirely removed, and all others of a doubtful character may have the points pinched. This will throw both size and flavour into the berry, and add to the value of the remaining wood for the ensuing crop.

Culture in the Rest Period.—Pruning is the first point; and the sooner this is performed after the fall of the leaf the better. It consists, mainly, in thinning out. When a bush is well thinned, no two shoots will touch; indeed, they should be, on an average, three inches apart all over the bush. Most good cultivators keep the middle of the bush very open. This is especially necessary during the first three years from striking the cutting; and the principle should be attended to, more or less, at every annual pruning afterwards. In selecting wood to remain, choose that which is strong, but not over luxuriant; the latter, with all weakly and inferior wood, may be cut clear away; cutting away, also, all coarse snags in the interior of the branches. Lastly, shorten every point which appears weakly or incomplete in character, just so far as such inferiority is manifest. The root must now receive attention. Some of our show gooseberry growers open a trench around their bushes annually, at about the distance the branches extend, cutting away all coarse roots beyond that line. They then fill in the trench with good fresh loam and cow-dung blended. Whether this be done or not, a top-dressing of half-decayed manure should be annually applied, scraping away the loose surface, and placing the manure next the top fibres, and then soiling the whole over.

Insects.—See *Abraxus*, *Aphis*, and *Nematus*.

Gordonia. (Named after Mr. Gordon, a London nurseryman. Nat. ord., *Ternstroemiaceæ*; Tribe, *Gordonieæ*. Allied to *Stuartia*.)

Hardy deciduous shrubs, except where otherwise stated; cuttings of young shoots in sand, under a bell-glass, in heat. The others, though

hardy, flowering late, are ornaments for the greenhouse; layers in autumn, seeds in spring, and cuttings in sandy peat, under a hand-light, in summer, in a shady place. *G. pubescens* and its variety *subglabra* are the hardiest; but *lasiantha* is the most beautiful, and blooms chiefly in summer and autumn. Peat, leaf-mould, and sand, with a trifle of loam, deep, and on a retentive sub-soil; if not naturally so, puddled with clay, so that the plant may obtain something of its native position in swampy soil.

Grabowski. (In honour of *H. Grabowsky*, a Silesian botanist, who lived at the end of the last century. Nat. ord., *Solanaceæ*.)

Hardy or half-hardy shrubs.

- G. boerhaviaefolia*. 6. Dull blue. April. Peru. 1780. B. R. t. 1985.
 — *duplicata*. Greenish. July. S. Brazil. 1840. B. M. t. 3541.

Grællsia. (Name unexplained. Nat. ord., *Cruciferae*; Tribe, *Alysinæ*. Allied to *Aubretia*.)

Half-hardy herbaceous plant, suited for rock-work; common sandy soil; division, and cuttings under a hand-light, in sandy soil, in summer.

- G. saxifragæfolia*, ½. White. July. Persia. 1844.

Graft, or Graft. This, also called the *scion*, is the portion of a branch selected to be inserted or grafted upon a stock or rooted stem, to form the head of the future plant. See **Grafting** and **Stock**.

Grafting is uniting a scion of one plant to the root, branch, or stem of another. The scion and stock must be of nearly-related species.

The objects of grafting are:—1st. To increase choice kinds. 2nd. To increase the vigour of delicate kinds. 3rd. To

reduce the vigour of those which are too gross. 4th. To accelerate the period of fruiting. 5th. To adapt kinds to soils for which they would be unfitted on their own roots. 6th. To renovate old kinds.

We now proceed to give a series of cuts, illustrative of all the modes which are usual in general horticulture:

1. *Whip Grafting*, called also *Splice* and *Tongue Grafting*.—This is the most common mode, and is that almost universally adopted in our nurseries; and when the stock and scion are equal in size, is perhaps the handiest. The head

of the stock is pruned off at the desired height, and then a slip of bark and wood removed at the upper portion of the stock, with a very clean cut, to fit exactly with a corresponding cut which must be made in the scion. A very small amount of wood must be cut away, and the surface made quite smooth. Care must be taken that no dirt be upon the cuts in this, and, indeed, in all the other modes. The scion must now be prepared. This should have at least three or four buds, one of which should, where possible, be at the lower end, to assist in uniting it to the stock. A sloping cut must now be made in the scion: this cut must correspond with that on the stock, and a slit made to fit in a cleft made in the stock when heading it. This slit serves to maintain the scion steadily in its place until properly fastened, and is more a matter of convenience than anything else. Care must be taken that the scion fits *bark to bark*, on one side at least; for it is not the old or existing portion of wood that forms the union, but a tissue from which the wood itself is produced, just as when the sides of a wound have to be reunited. This power exists in the cambium layer, which lays next the inner bark; and the substance which forms the union, and which is secreted by the returning sap, is termed cambium. Where the stock and scion disagree in point of size, of course only one side can touch, and great care should be taken in this part of the operation; and in the case of a young scion on an old tree, some allowance must be made for the ruggedness of the bark. The scion being thus adjusted, the whole is bound close, but not too tightly, with a shred of bass mat, care being taken that the inner

barks coincide. The clay is now applied, in order to keep the parts moist, and some practitioners pile soil over the grafted part, when near enough the ground. In all the modes of grafting it may be observed, that the chief ground of success lies in nicely fitting together some corresponding portions of the inner bark of the scion and stock.

2. *Crown*, called also *Cleft* or *Wedge Grafting*.—This is applied to various plants as well as fruits, as, for instance, the rose, cactuses, etc. Vines, also, are frequently grafted by this mode. As in whip grafting, it accelerates the union if the bottom of the scion has a bud or two. In the case of the vine, it is considered necessary to let the stock grow a little before grafting; care must be taken, however, to keep some growing portions on the stock, above the graft, or severe bleeding would ensue. As the name indicates, a cleft, or division, is made in the stock to receive the scion, which is cut like a wedge; again taking care, in case of inequality of size, to make one side fit *bark to bark*. When the scion and stock are unequal in size, both sides of the scion may be brought to fit by cutting the cleft nearer to one side of the crown than the other.

The wound is bound over, as in the other processes, with bast, and covered over with clay, or grafting-wax. The camellia succeeds well when grafted this way: even a single bud will make a plant, provided the stocks are kept in a damp and shady atmosphere for a few weeks after grafting. The stock here, also, should be slightly in advance, that is, should be forwarder in growing than the graft or scion. The best time is just as the sap is rising.

3. *Cleft Grafting*, as represented in this sketch, is only a kind of crown grafting, and is practised on stocks one or two inches in diameter, and, therefore, too large for whip grafting. Cut or saw off the head of the stock in a sloping form; with a knife or chisel cleave the stock at the top, making the cleft about two inches deep; keep it open by leaving in the chisel; cut the lower end of the scion into the form of a wedge, one inch and a half long, and the side that is to be towards the middle of the stock sloped off to a fine edge; place the bark of the thickest

side of the wedge-end of the scion so as to correspond exactly with the bark of the stock; take away the chisel, and then the sides of the stock will pinch and hold fast the scion. Two scions may be inserted, one on each side of the cleft; but in this case the top of the stock must not be cut off sloping. Bast and clay must be put on as in the other modes of grafting.

4. *Saddle Grafting*.—The top of the stock is cut to a wedge shape, and the scion or graft cleft up the middle, and placed astride on the wedge of the stock; hence the name. The binding and claying are performed as in the other modes, care being taken to make at least one of the sides meet *bark to bark*.

A modification of this mode is practised in some of our cider counties, where they do not hesitate to practise it in the middle of summer, when the young wood has become somewhat mature. The scion is chosen smaller than the stock, and is cleft about three inches at the lower end, so that one side is rather thicker than the other. The rind of the stock is then opened on one side, and the thick side of the scion introduced between the bark and wood; the thinner portion is carried astride the stock, and down the opposite side, a slight cutting having been made to receive it, on the principle of making corresponding parts meet. This, though tedious, is a very safe mode of grafting, inasmuch as it presents a greater expanse of alburnum for effecting the junction.

5. *Side Grafting*.—This, in general, is performed on trees on which the top is required to remain, and is well adapted for the insertion of new kinds of pears, or other fruits, on established trees, in order to increase the collection, or to hasten fruit-bearing. It is also adapted to furnish naked portions of old shoots. It is, however, not so safe a mode as some of the others. Little description is needed; the cut will sufficiently illustrate it.

6. *Chink or Shoulder Grafting*.—This is not much in use in this country; and, indeed, we see little occasion for its

practice. When the stock and scion are equal in size, however, it offers an opportunity of gaining the advantage of an extra amount of albuminous union. The cut will explain it.

ground.

7. *Root Grafting*.—An old practice; but, with regard to deciduous fruit-trees, it offers no particular advantage over the ordinary whip grafting, when performed near to the ground. It is, perhaps, better adapted for very large scions, for in many trees such may be used when two or three inches diameter. When strongly bound they may be soiled overhead, merely leaving a hole for the bud of the scion to come through, which, in this case, will rise like a sucker.

8. *Peg Grafting*.—This mode is now never practised in England, and we only insert the annexed engraving, because it completes our catalogue of all the known modes. Of these eight modes there are many modifications; but they are all derived from the eight enumerated. Peg grafting never having been practised by ourselves, we shall only make this extract relative to it: "The scion must be of the exact size of the

stock; bore a hole into the centre of the stock, one and a half inches deep; cut the bottom of the scion to fit; the edges of the barks must be very smooth and fit exactly."

General Observations.—For ordinary garden purposes, we think the whip, the cleft, the saddle, and the crown, the most eligible modes by far. These may be said to be the rule, the others are merely exceptional cases.

In all these proceedings a few axioms or main principles must be kept steadily in view. Of such are the following:

1st. The scions of deciduous trees should be taken from the parent tree some weeks before the grafting season, and "heeled" (the lower ends put into the soil) in some cool and shady place. This causes the stock to be a little in advance of the graft, as to the rising of the sap, a condition admitted on all hands to be essential.

2nd. Let all the processes be per-

formed with a very clean and exceedingly sharp knife, taking care that nothing, such as dirt or chips, gets between the scion and the stock.

3rd. Let the bandage be applied equally and firmly; not so tight, however, as to cut or bruise the bark. For this reason, broad strands of bast are exceedingly eligible.

4th. In selecting grafts be careful in choosing the wood, avoiding, on the one hand, exhausted or bad-barked scions, and, on the other, the immature, watery spray which frequently springs from the old trunks of exhausted or diseased trees.

Grafting Clay, to make.—Take some strong and adhesive loam, approaching to a clayey character, and beat and knead it until of the consistence of soft-soap. Take, also, some horse-droppings, and rub them through a riddle, of half-inch mesh, until thoroughly divided. Get some cow-manure (the fresher the better), and mix about equal parts of the three, kneading and mixing them until perfectly and uniformly mixed; some persons add a little road-scrappings to the mass. A vessel with very finely-sifted ashes must be kept by the side of the grafter, and after the clay is closed round the scion the hands should be dipped in the ashes: this enables the person who applies the clay to close the whole with a perfect finish. It must be so closed as that no air can possibly enter; and it is well to go over the whole three or four days afterwards, when, if any have rifted or cracked, they may be closed.

Grafting Wax.—The following recipe has been recommended by a first-rate authority: Take common sealing-wax, any colour but green, one part; mutton fat, one part; white wax, one part; and honey, one-eighth part. The white wax and the fat are to be first melted, and then the sealing-wax is to be added gradually, in small pieces, the mixture being kept constantly stirred; and, lastly, the honey must be put in just before taking it off the fire. It should be poured hot into paper or tin moulds, to preserve for use as wanted, and be kept slightly stirred till it begins to harden.

Grains of Paradise. *Amomum gra'na-paradi'si*.

Gramma'ngis. (From *gramma*, writing; referring to the markings on the flowers. Nat. ord., *Orchidæ*; Tribe, *Vandæe-Cymbidieæ*.)

Granadi'lla. This is a name sometimes given to several species of the *Passiflora*; but one only is the true *Granadilla*, *Passiflora quadrangula'ris*; but *P. e'dulis* also produces edible fruit, and

may be similarly cultivated. We are aware that there are other species of *Passiflora*, the fruits of which are eatable, such as the *P. malifo'rmis*, or sweet calabash; *P. laurifo'lia*, the laurel-leaved or water-lemon; and *P. incarna'ta*, or the flesh-coloured, etc.

Propagation.—They are nearly all readily propagated by seeds, but most cultivators who grow them for table purposes prefer cuttings; and they are quite right; for, like most of the *Cucurbitaceæ* group, to which they approximate, they are apt to run much to bine if raised from seed. Plants from cuttings grow more moderately, and blossom sooner. Seedlings will fruit readily at two years old; but cuttings struck very early in the spring, and highly cultivated, will fruit the same autumn, but not produce a full crop.

Soil.—A somewhat light and generous soil is best. The following is an excellent compost:—Decomposed, mellow, turfy loam, two parts; old leaf-soil, two parts; heath-soil, one part; and sand, one part.

Culture in Growing Period.—*P. quadrangula'ris* requires a greater heat than *P. e'dulis*—in fact, a heat equivalent to the Pine stove; whilst *P. e'dulis* will succeed well in an ordinary vinery. Bottom-heat is most essential, especially for the *P. quadrangula'ris*; and, indeed, in this, and a generous soil, consists the chief secret of successful culture. No place can exceed the corner of the bark-bed for the culture of either, provided they can ramble freely overhead, unshaded by vines or other creepers; for light is also essential. The corner of the bark-bed must be separated by bricks, pigeon-holed; a triangular space, which will hold a wheelbarrow of soil, will suffice, putting some bricks below for drainage. The shoots must be carried up to within a foot or so of the roof, and may then be trained in any way most convenient. The *P. e'dulis* will produce many branches; these must be kept thinned out, after the manner of Melons; but no stopping is requisite. The *P. quadrangula'ris* does not so soon crowd itself with spray; nevertheless, it will at times require thinning out. Liberal waterings must be given, and it must be remembered that the roots will extend through the pigeon-holes into the bark-bed, and will principally follow the side of the pit walls. The most important matter, however, is the artificial impregnation of the blossoms; for they will seldom "set" without it. The following is Mr. Appleby's mode of

setting *P. quadrangula'ris*:—The whole of the calyx, corolla, and crown must be cut off with a sharp pair of pointed scissors: and this must be done without injuring the flower-stem. When all these are cut away, there only remains the essential parts of the flower; the stamens, five in number, and the three stigmas. Then cut off one or more of the stamens bearing the anthers; and do this without shaking the dust or pollen out of the anthers; then touch each stigma with the anther, covering them with the fertilizing powder. Take an opportunity of performing this operation early in the morning, at the very time when the anthers are observed to be bursting. So far Mr. Appleby is, doubtless, right as concerns the *P. quadrangula'ris*, which has an exceedingly succulent calyx, and other appurtenances; but we never took any further pains with *P. edulis* than to look over the plants every day about noon; and whatever blossoms might be out, to pluck one of the anthers from it, and touch the face of the stigmas with it. By these means they generally become impregnated.

Culture in Rest Period.—As soon as the bearing season is over, towards October, the plants will sink to rest, and this may be facilitated by withholding water entirely. They will now become partially deciduous, and this will induce a ripeness in the shoots; and in the following February they may be pruned, cutting back all spongy and immature growths.

Fruit.—It is used in the dessert, and is capable of being kept for a fortnight or so in a fruit-room, or other place, if perfectly dry.

Insects.—We have known the Red Spider to attack the *P. quadrangula'ris*. For remedy, see ACARUS.

Granary Weevil. See *Cala'ndra grand'ria*.

Grange'ria. (Named from *N. Granger*, a traveller in Egypt and Persia. Nat. ord., *Rosaceæ*; Tribe, *Cryso'balan'ceæ*.)

Stove evergreen tree. Cuttings of ripe shoots in sandy soil, in heat, under a glass; peat and loam.

Grape Pear. *Amela'nchier botrya'pium*.

Grape Vine. *Vi'tis vin'ifera*.

Varieties for Walls.—1, August Muscat. 2, Early Black July. 3, Miller's

Burgundy. 4, Esperione. 5, Hâtif di Génes. 6, Royal Muscadine, White. 7, Royal Muscadine, Black. 8, Sweet Water, White Dutch. 9, Sweet Water, Black. 10, Black Hamburg. 11, Black Prince. 12, Claret. 13, Verdelho. 14, Pitmaston White Cluster. 15, Lashmar's Seedling.

As superior kinds for a pretty good climate and aspect, we recommend Nos. 2, 4, 6, 8, 10, 11; as kinds for inferior aspects, Nos. 2, 6, 10, 14.

For Greenhouse.—1, Black Hamburg. 2, Black Damascus. 3, Black Prince. 4, West's St. Peter's. 5, Royal Muscadine. 6, Dutch Sweet Water. 7, Chasselas Musqué. 8, Esperione. Of these, Nos. 1, 3, 5, 6, are the most to be relied on.

For Stove.—1, Muscat of Alexandria. 2, Cannon Hall Muscat. 3, White Frontignan. 4, Black Frontignan. 5, Black Hamburg. 6, Black Damson. 7, Royal Muscadine. 8, Dutch Sweet Water. 9, Chasselas Mnsqué. 10, West's St. Peter's. 11, Charlesworth Tokay. 12, Black Barbarossa. Of these, Nos. 1, 2, 3, 4, 11, are kinds of superior merit, and require much heat. No. 7, 8, at the warmest end, will be exceeding early. Nos. 5, 6, 9, 10, will provide for a succession. Of No. 12, we at present have no experience: it is stated to be a very long keeper, and is highly recommended.

Propagation.—*Layering* has almost fallen into disuse, their culture from eyes or single buds having superseded it. Layers will root either from the growing shoot, or from young wood layered in a state of rest. The latter operation is performed any time from November to the beginning of March, and no tongue or slit is requisite. Most of the Vines, in former days, were raised in this way; the nurserymen having old plants, or stocks for the purpose, around which the shoots were layered in pots, generally in February, and they made saleable plants by the autumn. Layering of the growing shoot is a more delicate procedure, and it is well to introduce a portion of the previous year's wood where possible.

Cuttings are best made from shoots in the rest state, and may either be made short or long. Speechly recommends two inches of the two year old, and one bud or eye of the new. These were inserted perpendicularly in pots, the bud just level with the surface. They will, however, strike root from thick shoots, of three or four years old, of a greater length and these may, if necessary, be planted at once in the border; or if in pots, deep ones must be used, and the

cutting may be sloped or bent. In all these cases, the cuttings must be buried nearly their whole length beneath the surface. Bottom-heat will facilitate speedy rooting.

Eyes.—This is the most approved plan, for the plant thus approaches nearest to a seedling state. These are generally planted in pots, a single eye in each, at the end of January, and plunged in a bottom-heat of from 70° to 80°. Prunings are reserved for this purpose in the autumn, and these being cut in convenient lengths, are imbedded in moist soil until winter. About half an inch of wood may be reserved above the eye, cutting it sloping away from the bud, and about an inch or so below the bud; the latter section made horizontally. These, inserted singly in five-inch pots, may be plunged in a bottom-heat of from 70° to 80°, and care must be taken that the worms do not get into the soil. When grown nearly a foot in height, they should be re-potted into pots of about seven inches diameter, using a rich, turfy soil, and draining thoroughly. Many good gardeners reserve a portion of the two years old wood at the base of each eye, and there can be little doubt that it is good practice.

Coils.—Obtain prunings from healthy and fruitful vines on the rod system; these prunings should be from two to four feet in length. Such being plunged in a bottom-heat of from 70° to 80°, and in an atmosphere ranging from 50° to 60°, have a tendency to produce roots before shoots; and this is the object sought. Fruiting-pots of twelve to fifteen inches in diameter should be used, and a compost of turfy loam and half-rotten manure, with the addition of charred material, lime-rubbish, or sand; any or all of them added in the proportion of a sixth of the mass, in order to insure the free passage of moisture. Thorough drainage being secured, the end of the shoot is pressed down against the bottom of the pot, and the shoot bent round, until as many coils or turns as possible are made; leaving, at last, four or five stout eyes above the level of the pot rim. The wood is then filled with the compost, and careful watering, a judicious control of heat, augmenting the amount of atmospheric warmth as the leaves unfold, together with the usual routine of stopping, thinning the berries, etc., as applied to established vines, must be carried out. The turfy compost is filled in as the coiling proceeds.

Grafting is not often practised. As in most other cases of grafting, the stock

should be slightly in advance of the scion. Perhaps the stock should have unfolded a few large leaves before the operation is practised. Then the usual whip grafting is the best plan. A couple of eyes on the graft are sufficient. It is good practice to bind moss round the whole at last, even shading the buds of the scion for a while. The moss may be moistened daily.

Inarching.—This may be performed with either the growing shoot, or with that in a rest state. A plant established in a pot of the kind to be introduced must be procured. With regard to inarching in a rest state, it is proper that the sap should be in motion at the period of operating, and that the stock, if possible, should, as in grafting, be slightly in advance of the scion. Vines which are breaking are in an eligible state, and the kind to be inarched may be just emerging from a rest state. The point of junction being determined, the pot must be so fixed as that no slipping can occur, and that the shoot may be readily bent to meet the parent plant. Nothing is necessary but to pare a thin slice of bark with a little of the wood from the facings of the scion and stock, which are to be fitted, and then to bind them carefully together close, but not too tight, just as in ordinary grafting. A little moss may be fastened round the point of junction, and this frequently moistened. Inarching of the growing shoot is, however, the best practice; but, it is an operation that requires nice handling. The shoot of the stock is best at about the middle of its annual growth, when it has begun to acquire some solidity and toughness. The scion may be somewhat younger, and everything being adjusted, a section must be made in each, as before, cutting through the bark and a little into the alburnous matter, and fitting them nicely together. It may be observed, that the ligature must not be so tight as in the old wood. The whole may be covered with moss, and in six weeks the junction will be complete. In the mean time a progressive stopping of the spray on the stock must take place, in order, by degrees, to transfer a portion of the luxuriance of the stock to the scion. When the pruning season arrives, the stock may be cut back in part or wholly. Thus, a viney possessing inferior kinds may be renovated in a very short period.

Seed.—Perfectly ripe grapes of the kinds intended to be propagated from should be pressed, the seeds washed and thoroughly dried, and then secured, like

other seeds, until the following February. They may then be sown in well-drained pots, in a light, rich soil, rather sandy, and plunged in a bottom-heat of from 70° to 80°. In about a month they will vegetate; the seedlings may be potted off, and henceforward reared as plants from eyes, continuing bottom-warmth until Midsummer, and training the shoot (unstopped) fully to the light in a warm situation. They may, in the autumn, be cut back to two or three eyes, and grown through the following summer as before, again pruning back in the autumn. In about four years they will fruit on their own roots; but, perhaps, a year will be gained by inarching them near the extremity of a sound and fruitful old vine.

Wall Culture.—The first essential is a mellow and thoroughly-drained soil. An ordinary sandy loam is the best staple; but almost any common garden-soil will suit, if it is capable of receiving and transmitting moisture with facility. Vine roots will descend to a considerable depth if the soil be mellow; but we would rather grant them extra width, especially if the situation is not particularly favourable. Whether borders, or, what are much more economical, stations, are made, we would first thoroughly drain the site, and then place some imperishable material, as stone, brick, or clinkers rammed close beneath them, leaving only half a yard of soil in depth, unless the roots are securely limited in width. This done, the natural soil must be examined with practical accuracy, and accordingly, as sand or clay predominates, so must be the amount and character of the correcting material. If destitute of organic matter or turfy fibre, something must be introduced to enrich it, such as fresh manure, and abundance of rotten weeds, leaves, etc., indeed, anything of a decaying vegetable kind; remembering that a good portion must be such as will endure long, and slowly give out its enriching qualities. Some coarse bone-manure and rubbly charcoal will be a capital addition; and a good deal of charcoal-rubbish or brush-wood. If the situation is cool and damp, place half the volume of this material above the ordinary ground level.

Planting.—The end of March is the most eligible time; and strong plants being at hand, if in pots, let the soil be shaken away gently, and every root be carefully uncoiled, and spread out, like a tree fan-trained, and place a little superior compost about the roots, covering the surface with three inches of coarse

charred material. This will absorb a great amount of heat from the sun, and admit water freely when necessary. As the plants grow, they must be carefully trained, and no stopping practised the first season. In the autumn, however, they must be pruned back to three or four eyes; and in the next season the shoots from these eyes must be trained to the desired form, which will be regulated by the character of the space they are to occupy, whether on a building or a wall.

Out-door Culture during the Rest Period.—Pruning is a first consideration, and this is done soon after the fall of the leaf. Many conflicting practices, as to out-door culture, have competed for the palm of victory here, even as with in-door vines; but it is probably best not to attempt to tie the hands of those who try their culture by too severe rules. One safe maxim is, that no two of the principal leaves should so overlap each other as to obstruct the solar light. From about eight to ten inches, therefore, at least, may be given between each of the growing shoots. This, then, will be a guide as to the distance at which the shoots should be trained. As for root culture at this period, nothing will be needed but to preserve the surface fibres from the spade, which is but too apt to approach too close to those on kitchen-garden walls. When vines become somewhat exhausted with much bearing, top-dressings of good soil and manure become necessary.

Out-door Culture during Growth.—We must here be brief, for the main principles will be found somewhat identical with those connected with in-door culture. All superfluous young spray must be thinned away, and the bearing shoots stopped an eye or two beyond the bunch. Where, however, there is walling to be filled, the dresser may leave several eyes or buds beyond the bunch. In due time the bunches must be thinned; one to a square foot of wall will, in general, suffice. The berries, too, must be thinned out at the proper period, and a frequent stopping of the lateral shoots practised, never suffering them to shade the principal leaves. Towards the beginning of September, all the stopped laterals may be entirely removed, in order to permit a free circulation of air, and allow the sun to heat the wall; protection, also, must be afforded to the bunches against wasps, flies, etc.

Greenhouse Culture.—Having attended to the character of the soil requisite for the vine, we have little to report on the

subject of border-making, which must, however, be at all times considered the most important point in the whole of the proceedings. A more generous soil is necessary for in-door vines, inasmuch as a greater demand exists at times on their vital powers through the powerful effects of solar light beneath glass; as also owing to a greater amount of dryness at times in the atmosphere. The first point is to elevate the border above the ground level in proportion to the lowness, coldness, or dampness of the situation. Thorough drainage we have before pointed to; it is not possible to drain too much if the soil be of proper texture. As to soil, turfy loam, inclining to sand, should form nearly one-half the volume of soil. To this may be added another quarter of coarse manure, leaf-mould, etc., rather raw than otherwise; and the other quarter, part of rubbly and imperishable materials, such as lumpy charcoal, old plaster, and the rubbish of old buildings, coarse bone-manure, etc. All these well blended, and filled in, when dry, will produce a first-rate compost, taking care to place a layer of turf at the bottom.

Course of Culture.—Whatever combination exists as to a greenhouse vinery, whether it be for vines alone or used in conjunction for pot-plants, a uniform system should be pursued as to the vines, both during the growing season and the rest period. This system consists in the regular pruning, dressing of the wood, in order to facilitate the extirpation of all insects, and the usual vine-dressing during the growing period, the latter being, disbudding, stopping, thinning the berry, and training—principles applicable to the vine in all its positions.

Stove Culture.—Vines in stoves are generally combined with pine culture, and the excitement by heat is, therefore, at times considerable. In former days it was supposed that vines must be turned outside the house and frozen, in order to restore their energies; but abundant proofs exist that from 50° to 55° may be submitted to, in extreme cases, during the rest season. Whatever culture is combined with that of the vines, it is best to confine these to the rafters on the spurring system. For early forcing, and where the house is specially devoted to vines, it is another affair: here either the long-rod system or the spurring may be used. We need not repeat advice as to border-making, and the usual routine of disbudding, stopping, thinning the berry, and the frequent pinching of the laterals. One remark may be permitted as to bor-

ders; let them be *inside* the house if the interior arrangement will permit, and the front wall on arches. When at rest, we would not allow the thermometer to sink below 35°.

Vines in Pots is a mode of culture only to be recommended as an adjunct to late vineries, and where the possessor, not desiring to build a house for early forcing, yet desires to have a few early grapes. The plants should be reared from eyes, and receive very high culture; and at the end of the second summer they should be strong canes, and in high perfection for forcing. They must receive liberal shifts when they need re-potting, and their shoots be constantly trained in a very light situation. The young plants, at the end of the first season's growth, will require pruning back to two buds, from which one may, during their progress, be carefully trained, and the other removed. When the cane has grown about five feet in length, during the second season, it is well to stop it, in order to strengthen the lower leaves, on the healthy action of which the future crop depends. The leader, however, which succeeds, may be laid in full length, well exposed to the light; but the laterals which push from the sides must be pinched back, leaving one bud only, and this pinching must be continued all through the season, when necessary. In the second autumn they will be strong canes, with remarkably plump buds; and they may now, when the leaves are decayed, be pruned back to some five or six eyes, according to the wish of the cultivator. Having received their final shift into pots of about fifteen inches in diameter in the preceding June, they will require nothing but a rich top-dressing. They enjoy a bottom-heat of 70° to 80°; but they may be made to succeed on the kerb-stones or back shelves of the stove, away from cold draughts, and near the flues or piping. Liquid-manure must be liberally supplied, and the same course of culture as to disbudding, stopping, thinning the berry, and training, pursued as with the rafter vines. A rich, turfy loam must be used as compost; three parts of this to one of rich, half-decomposed manure, will be found excellent, adding some charcoal and a little lime-rubbish. The turfy loam should be nearly a year old, and must be well chopped with the spade, not sifted. The pots must be most carefully drained, nearly one-fifth of their depth: any stagnation whatever will surely prove fatal. If the pots were unplunged, some screen, such as moss or old matting,

should be interposed between them and the sand, or they may have double pots.

Diseases.—*Shrivelling* of the berries of the grape in stoves appears to arise from the roots of the vine not supplying a sufficiency of sap, as well as from its not being duly elaborated in the leaves. This occurs if the roots are in a cold soil, or are vegetating in an outside border, the temperature of which is too low compared with that of the stove. In the first case, thorough draining and the incorporation of calcareous rubbish, and in the second case, protection to the border and stem, will remove the evil. If the sap be not duly elaborated, it must arise, either separately or conjointly, from the leaves vegetating in an ungenial atmosphere, or from their being too reduced in number.

If the roots of the vines are found to have penetrated the soil deeply, they should be lifted very carefully, brickbats placed beneath the roots, and these trained about nine inches beneath the surface. If drainage of the border has been neglected, let it be effected at the same time. If the loss of the crop which would be occasioned by the lifting of the whole of the vines would be inconvenient, only one or two can be so treated in successive autumns. The most injurious time for an unnatural disparity of temperature in the air and soil to occur is at night; for, as was justly observed by the late Mr. Knight, an ill effect of high temperature during the night is, that it exhausts the excitability of the tree much more rapidly than it promotes the growth or accelerates the maturity of the fruit, which is, in consequence, ill supplied with nutriment at the period of its ripening, when most nutriment is probably wanted. The Muscat of Alexandria, and other late grapes, are, owing to this cause, often seen to wither upon the bunch in a very imperfect state of maturity; and the want of richness and flavour in other forced fruit is often attributable to the same cause. The Frontignans are among the varieties apt to shrivel under great disparity of temperature between the roots and branches.

Somewhat allied in its causes to shrivelling is that unsightly imperfection where the berries do not come to maturity at the point of the bunches, leaving from five to ten quite colourless and sour, though others on the same bunch are fine and large. In such case the remedies are to give more heat and air, keeping the border warmer than before, and to avoid cold dampness in the house: leave as much foliage as can be exposed fully to

light. The leaves removed must be by little at a time. In thinning, clip off a few berries at the lower extremity of the bunch; the rest will swell better.

Shanking is an ulceration, or gangrene, attacking the footstalks of the bunches, and appears to be occasioned, like shrivelling, by the temperature of the soil being too much below that in which the branches are vegetating; and, consequently, the supply of sap to the grapes is much diminished, and the parts which thus fail of support immediately begin to decay. This is an effect always the consequence of a diminished supply of sap, apparent either in the leaves, flower, or fruit. The disease, like every other putrefaction, does not advance rapidly unless there be much moisture in the atmosphere.

The coldness of the soil causes this torpidity in the action of the root; and this, perhaps, at the very period when the greater demand is made upon it to sustain the excessive perspiration which is going on in the leaf, and to furnish fresh matter for elaboration, to both which ends it is frequently quite inadequate, owing to drenching rains. If the young fibre be examined at such inclement periods, it will be found somewhat discoloured, and, in some cases, quite rotten. Shanking, we conceive, is generally caused by the unnatural disagreement of temperature between the root and top, independent, in the main, of the question of moisture. It generally occurs with vines which have been somewhat forced; seldom on open walls—seldom with vines forced in pots or tubs. The obvious prevention of shanking is securing a congenial relative temperature to the roots and foliage.

Rust comes upon the berries in the form of a rough, rusty appearance of their skins, which have, in fact, become thick and indurated. Some think it arises from their being handled, or the hair of the head touching them; but the disease is often too general to admit of this topical explanation. We believe it to arise from an over-heating of the vinery, however unintentional, whilst the grapes were young, and thus tending to force them to a premature rapidity of growth. Any excessive pressure upon the cuticle, whether from within or from without, causes its thickening. This considerable elevation being succeeded by a sudden reduction of temperature, will almost certainly induce the disease.

The Spot affecting the berries seems to be the same disease as shanking, only affecting a different part. Like this dis-

ease, it is a gangrene, and is probably occasioned by an irregularity in the supply of moisture and vicissitudes of temperature, but especially if one of the extremes is much below the degree of heat most favourable to the healthy growth of that plant. Muscats are particularly liable to the spot. Our opinion that sudden vicissitudes of temperature are the causes of this disease, seems to be well sustained by the fact, that the parts nearest the glass, that is, the upper portions of the bunches, and those parts most exposed to the sun's influence, are the first to suffer; and this, also, goes far towards substantiating the assertion, that the shade of the foliage is necessary to the well-doing of grapes.

Want of Colour is often a defect of the Black Grape, but not at all necessarily arising from deficient light. The green colour of leaves depends entirely upon the presence either of light or of uncombined hydrogen gas; but vegetable reds, purples, and other colouring matters of fruits are formed, though less intense, even in a total absence from light. So far from full exposure to light being requisite for the full colouring and ripening of grapes, they never attain these desired qualities so well as when shaded by one thickness of leaf. The colouring matter of all fruit is dependent partly upon the leaves immediately above it, and partly upon the fruit itself, the necessary digestion of the sap being commenced in the one and perfected in the other. If this digestion or elaboration of the sap is checked by ungenial temperature, but more particularly if the crop is too heavy for the vine, or if the leaves, especially above the bunches, are too much thinned, defect of colour will be the very usual consequence to the berries. We have seen the blackest of berries in situations where the sun had never shone on them since they blossomed; indeed, it only requires a little close observation for one season to dispel such a fallacy. It sometimes, however, happens, that the principal leaves on the same shoot with the bunch are shaded by other main leaves, or by laterals. Such shading is sure to be prejudicial to the colouring of the berry, as well as to the maturation of the buds connected with the shaded leaves. And here we have one of the reasons for such close stopping as the vine is subjected to. Over-cropping alone will lead to bad colouring; indeed, is one of the most fruitful sources of it. It exhausts the tree of every particle of prepared sap, and produces debility in the root,

which renders it readily susceptible to the stagnating rains of an unpropitious season.

In order to promote good colouring, the ripening process should not be hurried. It is evident that very high temperatures are not required for this purpose, for the Black Hamburgh, on common walls, is not deficient in colour, in a good season. Now, the colouring process, in the latter case, occurs in the end of September, when the temperature at night must sometimes be near the freezing point. It is a common observation of practical men, that the cold nights of autumn hasten maturity in many crops; and this is undoubtedly a fact, and traceable, we presume, to a cessation of the growing principle, causing thereby a concentration of the energies of the plant. We would say, therefore, beware of too high a temperature during the colouring process, unless accompanied with much solar light, and even then avoid extremes. We would more especially avoid night heat at this period, and would promote a circulation of air night and day.

Bleeding.—This only occurs to the vine from the unhealed surfaces of cuts made after the sap has commenced its motion, and before the leaves are well expanded. A red-hot iron, applied to the bleeding surface until it be charred, will stop the effusion of sap for a time, if not permanently; and to effect a complete stoppage at once, coat the charred surface, and rub well into it a paste made of lime newly burnt and grease. This hardens and forms an effectual plaister.

Mr. Knight's plaister we know to be effectual, and is thus composed:

One-fourth of calcined oyster-shells, beaten to fine powder in a mortar, and three-fourths of cheese, worked together, until they form a sort of paste. This mixture, pressed into the pores of the wood, either with the thumb or any other means, will effectually stop the flow of the sap: sometimes a repetition may be necessary, if it is not well forced into the pores. See *Mildew*.

Insects.—See *Acarus*, *Aphis*, *Coccus*, *Curculio*, and *Thrips*.

Grape Phylloxera, or **Grape Louse**. *Phylloxera vastatrix*. This terrible enemy to the Grape-vine is an insect intermediate in character between the *Aphididae* (plant-lice), and *Coccidae* (scale-insects, mealy bug, etc.), but is retained in the former family.

The Phylloxera attacks both the leaves and roots of the Vine, and has

two corresponding types of existence, which may be designated respectively the Gall type and Root type.

The *Gall type* is found in the galls formed by itself upon the leaves (Fig. 1). Each gall contains one, or some-

times two insects; they are always females, as no male of the gall type is known to exist. The insect is exceedingly small, being about $\frac{1}{16}$ of an inch in length, and is of a dull orange colour; it has very short legs and antennæ, and is furnished with a sucker. Fig. 2 represents the insect seen from above, and Fig. 3 seen from beneath, highly magnified. These females deposit a number of eggs in the gall, which hatch in a few days; the young lice then crawl out of the gall and spread over the plant, usually settling down upon the younger leaves, and at once commence to suck their juices. The puncture causes the tissues of the leaf to bulge out and thicken on the underside, forming a cavity above, which gradually deepens and incloses the louse, forming the gall; the mouth of the gall is closed in with hairs. In a few days after forming the gall, the louse commences to deposit eggs—the number deposited by each louse is said to average about two hundred—these hatch and make new galls, and the process is repeated during the summer for five or six generations. When the leaves fall, the gall louse migrates to the roots and there hibernates. The gall type does comparatively little harm to the Vine.

The Root type.—Of this type there are two forms, a wingless and a winged form. When first hatched the larvæ of both forms are alike, and almost undistinguishable from those hatched in the galls; after a time they shed their smooth larval skin and become tubercled or warted, which is never the case with

the gall type. Soon two forms are distinguishable: the one is of a greenish yellow, with the front part swollen out, tapering at the abdomen; the other is of a brighter yellow, with a more oval outline, and the abdomen more truncated at the tip.

The first form, like the gall type, never acquires wings, but remains upon the roots of the Vine, and is employed in depositing parthenogenetic eggs during the greater period of its existence. As it matures it becomes more degraded in structure, especially with regard to the eyes, which are perfect in the larva state, and gradually become more simple with each moult, finally consisting of but triple eyelets.

The second form is more active than that just described, and when mature is furnished with wings. In the larval and pupa state the body is tubercled. When the pupa are full fed, they crawl up to the surface of the ground and over the Vines, and there assume the winged state. The body of the winged insect is without tubercles; it is of a deep yellow colour, with whitish wings. Most of these are females with an enlarged and elongated abdomen; the abdomen of the males is short and contracted, terminating in a fleshy protuberance. The winged insects are chiefly developed during the latter part of July, August, and September; and it is this form that is chiefly concerned in the spread of the disease, for the wingless root type and gall type can only spread the disease by crawling from Vine to Vine—necessarily a slow process.

The injury done to the Vines is effected by the root type, as the gall type is comparatively harmless. The root *Phylloxera* commences its attack by feeding on the juices of the tips of the roots, the punctures made by the insect causing a swelling, and finally the decay of the root attacked; they then attack a fresh root, until the whole of the root system is eventually destroyed by them, and the Vine dies. The first year of attack there is scarcely any outward sign of disease; but the second year it is made evident by the unhealthy appearance of the leaves, and the small amount of growth. The symptoms become more and more evident, and the third or fourth year the Vine dies; though before death takes place the *Phylloxera* leaves the doomed Vine for a fresh one.

Remedies.—No disease among plants has probably ever caused such consterna-

tion in Europe as the Phylloxera disease, and consequently no disease has perhaps had so many remedies tried upon it, or with such little effect. The remedies said to be most efficacious are submersion, and the application of sulpho-carbonate of potassium.

If submersion by flooding with water be tried, it should be done very thoroughly or it is of little avail. It should be done two or three times during the autumn and winter months, allowing the water to remain five or six weeks each time. During the growing season the Vines should not be inundated for more than two or three days at a time; by this plan, where practicable, the insect may be effectually exterminated.

The application of the sulpho-carbonate of potassium seems to be the best and simplest yet discovered, as it is said to completely destroy the Phylloxera, without injuring the Vine in the least. It is applied thus:—Take from 1 to 1½ oz. of dry sulpho-carbonate of potassium and dissolve in water; the solution is to be poured into holes made around the stem of the Vine, and the holes plugged up.

Great care should always be taken to prevent the introduction of the Phylloxera into a vinery. Any suspected plants should be bathed in some strong soap-suds before planting, and the soil well sprinkled with lime, sulphur, or potassic salts mixed with guano, or alkaline sulphate, mixed with copperas and rapeseed; or watered with sulphuret of potassium dissolved in liquid manure.—Condensed from the "Gardeners' Chronicle" for 1874.

Graptophyllum. (From *grapho*, to write, and *phyllon*, a leaf; referring to the markings on the leaves. Nat. ord., *Acanthaceæ*; Tribe, *Justicieæ*. Allied to *Beloperone*.)

Stove evergreen shrubs. Cuttings of young shoots, just getting a little firm, and a heel of the older wood at its base, in sand, under a bell-glass, in heat; peat and loam.

Gravel Walks, like all other walks, require a good substratum of drainage, and the facing about five inches deep of gravel. It must have no stones mixed with it larger than good-sized marbles, and about one-fourth of it must be much finer to fill the interstices. Pit-gravel, with a slight admixture of clay, and the more rubbly the better, is the best for binding and forming a solid walk. The more speedily it is laid down after digging from the pit, the more firmly will it bind.

The following is an excellent plan to make or turn gravel walks in dry weather. If of a sandy or gravelly nature, strew a little clay or marl upon the walk. When turned over, take away the large stones and place them at the bottom of the soil. Immediately after you level your walk, apply your iron roller steadily, and let a labourer follow the roller, pouring upon it water regularly as it passes over the ground; in twenty-four hours after, if the weather is dry, it will be as solid as a stone-floor.

The best method of extirpating grass from a gravel walk, is to spread salt in considerable quantities over its whole surface; and if, after the first application, it is found that portions of the grass still exist, let another coating of salt be applied, which will effectually destroy it. Care must be taken, however, if the walk is edged with box, that the salt does not come in contact with it, otherwise it will destroy the edging also.

In the early part of April, gravel walks are usually turned. After the walk has been broken up and levelled, and a facing of new gravel spread over, this ought to be left for three or four days,

and until a shower of rain has fallen, before the roller is used. This bleaches the gravel, and washes down the fine particles, so that, immediately after rolling, the walk is solid, and has a clean, bright surface.

Grave'sia. (Dedicated to *Mr. Graves*, a botanical collector in Madagascar. Nat. ord., *Melastomaceæ*. Allied to *Bertolonia*.)

Dwarf stove herbs, with beautiful variegated leaves. Seeds and cuttings, which should be rooted in bottom-heat. Rich sandy loam. Moist atmosphere.

G. gutta'ta. Lilac. Brazil. 1864. Belg. Hort. 1870, t. 14. Syn. *Bertolonia guttata*. B. M. t. 5524.

Great Burnet. *Pote'rium Sanguis-or'ba*.

Great Centau'rea. *Centau'rea centau'rium*.

Greene'ria fuligi'nea. A fungus producing the disease, known as "Bitter-rot," on grapes.

Greenhouse. This is a light, airy structure designed for plants which can sustain a lowish temperature, but cannot withstand the vicissitudes from frost to sunshine, and from damp to dry, of our common winters. It is distinguished from a plant-stove in requiring but little artificial heat; and from a conservatory in having all the plants (with, perhaps, the exception of climbers for the rafters) grown in portable pots or tubs, and these generally set upon a stage to bring them nearer the glass.

The mode of *constructing* such a house must be regulated by the wishes of the proprietor, and the conveniences at his disposal. For general purposes any aspect will do in an emergency, except the north, and that might be selected for those plants that delight in the shade. The more command of light, with the means at hand of reducing its fierceness and heat when too powerful, the better. From due south to south-east and south-west may be considered the best aspects. If it is a lean-to house, having a sloping roof from a back wall, it should always have a considerable amount of upright glass in front to receive the oblique rays of the sun in winter. By the side of a cottage *ornée* the front of the house may thus partake of the same style of architecture, while the shed-like, sloping roof

maybe exchanged for a ridge-and-furrow one, and that concealed from external observation by a light entablature or frieze work. For a neat detached structure it should stand, less or more, north and south, have a ridge-and-furrow roof, and means for breaking the sun's rays in the morning and afternoon. We are supposing it to be glass all round. When in connection with other buildings a very useful and elegant house is formed, having the front and ends of glass, a hipped roof, and an opaque back wall. Here, likewise, by an ornamental entablature, the roof, if desirable, may be wholly or partially concealed, so as not to interfere with architectural propriety, though we should have no great scruples on this score, as the utility of an object, if apparent, gives its appropriateness.

The size of the *glass* to be used must depend upon the taste and the money wished to be spent by the proprietor. For the roof, especially, it will be desirable to have it at least sixteen ounces to the foot. Small squares can be procured in boxes very cheap; but what you gain in glass you partly lose from requiring so many sash-bars. We should not care about having them much above eighteen inches in length. All things considered, if we were to roof a house most economically, we should obtain strong machinery-cut sash-bars, dispense with rafters, use glass from fifteen to eighteen inches wide, and say a foot in depth, and secure means of ventilation without touching the roof by the upright glass and wooden ventilators at the ridge in the roof and in the back wall.

Stages.—These are generally shelves, arranged in stair-like fashion, partaking less or more of the character of the roof. For a general collection, the stage may be from five to six feet from the glass roof; for insuring dwarf, compact, bushy plants, the distance should be from three to four feet. The lowest shelf of the stage should be a little higher than the shelf that surrounds the house next the front glass. Where the roof is *hipped*, even though the back wall be opaque, if the house faces the south the stages should be hipped, too, terminating in a single shelf, broad or narrow in the centre. The north part would be admirable for *keeping* many plants in winter, and exhibiting in summer those that were in full bloom. In a wide house it is always preferable to have several stages, in the shape of circles, ovals, or triangles, whichever is most approved, with walks between them. The expense, and the room apparently lost, are more than compen-

sated by the ease with which all the plants may be examined, and the greater thickness with which they may be safely set, as the pathway will be so many breathing zones. (See **Flower Stages**.) For low-hipped, roofed, and ridge-and-furrow roofed houses, flat, table-like, trellised stages will be the best; the highest plants being set in the centre, or if necessary, one being placed now and then on a pot. As an improvement on this, where extreme economy was the object, we would dispense with the wooden trellis, and substitute a bed of earth, kept in its place by brick walls, the earth being first covered with cinders, and then with pure sand, on which to set the pots. The damping of this sand from watering in summer would be a source of health to the plants, and save them from many visitations. Small inclosures in such an earth-pit, if suitable compost were used, would be excellent for the less hardy creepers, which would be likely to maintain a lingering existence if planted, as they sometimes are, in a border close to the front wall.

Temperature.—If merely preserving the plants is the object, then artificial heat may only be applied to maintain a temperature of from 35° to 40°. This low temperature must not, however, be long continued in a stagnant atmosphere. It will, therefore, be necessary to raise the temperature to admit air during the day. Where it is desired to grow the shoots slowly, and to keep a winter display of plants in bloom, the temperature must not sink below 45°. In either case a rise of 10° or 15° may be allowed for sunshine in winter. In summer, the chief difficulty will be to keep the house cool by admitting all the air possible, and having it on night and day. If the plants are turned out into pits and shady places, and even very sunny places if their nature requires it, and their place is supplied with tender annuals, etc., then more closeness and moisture must be obtained—a limitation of air and plenty of moisture giving all the essentials of a plant stove.

Artificial Heat.—The best, because the most equal and the cleanest, is hot water; and the simplest of all contrivances is the best: a compact little boiler, well set, and a flow and return pipe on the simplest principles. A small boiler and two or three-inch pipes are the most suitable for a greenhouse where only quick and occasional fires are wanted. Flues are far from being despicable conveniences. In some respects,

in small houses where a higher temperature is wanted at one end than another, they answer better than hot water. When neatly built they are no eye-sore in a house. To insure draught the flue should be at least a third deeper than it is wide, and the mouth of the flue should be eighteen inches above the bottom of the surface. For greenhouses, one foot of four-inch pipe will be necessary for every forty cubic feet of air, making allowance, more or less, according to the surface of glass, or the presence of opaque walls; in other words, taking the square foot of glass, it would require a foot of four-inch pipe for every six feet of glass; or a foot of common flue above the ground for about ten or eleven feet of glass.

Ventilation.—Means should be secured for a thorough circulation of air from the sashes in front, and the highest point in the roof, as there the heat will generally be the greatest. In cold weather in winter, unless there are means for heating the air before it enters, the little given should be at the top of the house, as thus the cold, dry air would be heated and absorb the moisture before reaching the bulk of the plants. When the air is very dry, and the weather very cold, the less air that is given the better. In such circumstances, the heating medium should be cool before the sun strikes upon the house, and then the sun-heat will raise the house the less; and 10° or 20° for a short time, from sun-heat is a very different affair from having that increase from artificial means. For greenhouse plants, generally, in favourable weather, too much air cannot be given, night or day, from the middle of May, to the middle of September. For two months preceding May, and subsequent to September, air should be given early in the morning, even if it should be withdrawn or reduced soon afterwards, or early in the afternoon. In winter, unless the air is very mild, it will be time enough to give air by ten o'clock, and shut up between two and three. When the weather is very severe, one hour, or even less, in the middle of the day must be sufficient. In dull, close weather, air should be given, though a brisk fire should be put on during the day on purpose. When, however, the greenhouse is changed into a vinery, a place for growing tender annuals, etc., the forwarding of the growth of Camellias, Epacris, Azaleas, etc., then the temperature in spring and summer must be higher, and the atmosphere closer and moister. By means of divisions, you may have almost as many tempera-

tures and atmospheres in one house as you please, by regulating the ventilation of the different compartments. Slight wooden movable divisions we find extremely useful in pots, as we can then give a peculiar treatment to one or any number of lights at pleasure.

Firing.—The heat from the furnace merely extends vegetable tissues; that from the sun expands and concentrates them. No stoker should visit his furnace without knowing the temperature of his house, the temperature of the external atmosphere, the direction of the wind, and the changes that have taken place in a certain number of hours, and thence calculate what will be the most likely to happen. The minimum temperature should never be exceeded by fire-heat during the night. More than sufficient is not only *waste*, the plants are *drawn* and *dried*, while less advantage can be taken of the glorious light and heat which come from the sun. For dispersing damps, etc., use a brisk little fire during the day, and allow it to go out. In very dull, close weather in winter, such a fire often, if even for an hour, would be useful; not for heat, but for enabling us to give more air, and causing a rapid circulation among the plants.

Watering.—The rule is, water so as to reach every fibre of the plant's roots, and then wait until a similar repetition is necessary. A plant may want watering twice a day in summer, and, perhaps, only twice a month in dull weather in winter. From the end of September to the middle of May, let the temperature of the water used be from 5° to 10° higher than the minimum temperature of the house. From the periods mentioned, making, of course, due allowance for peculiar weather, watering should be performed in the morning; in cold weather not too early. Thus the stimulus of sun-heat, diminished though it be, meets the plants when they have received their refresher; the extra moisture is parted with before the evening comes; and there is not that rapid cooling of the soil by evaporation during the night. In the summer we reverse the time of watering, and perform the operation in the afternoon and evening. Anything that tends to cool the soil and the plant is then refreshing. By watering in a bright morning, the moisture is exhaled rapidly from the soil, as well as through the foliage of the plant, which does not, in consequence, receive the full benefit of the watering, and, therefore, soon requires a fresh supply. In the evening the evaporating tendencies are approach-

ing the minimum; the plant has full time to absorb and refresh itself, and thus is more able to stand the brunt of the following day.

Manure Watering.—This should be applied often, but weak and clear; a little quick-lime added will effect the clearing, at the expense of driving off a portion of the ammonia. It is applicable in almost any case where luxuriance of plant is the chief object; where size of bloom and compact, rather than slender, growth, are the desideratum, it should not be applied until the flower-buds appear.

Syringing.—This is a most valuable mode of applying water, as it promotes cleanliness, and is as necessary for removing dust and incrustations from the foliage as soap and water are for cleaning our own skins. In winter it should be done at mid-day, when the sun shines; in spring and autumn, in the morning; in summer, chiefly in the evening, though at that season we frequently give them a dash several times a day.

Pruning.—This is generally done when the plant has finished flowering—when we wish it to start into fresh growth. Of course there are exceptions; without these exceptions the nature of a plant and the mode of its growth must be the basis for a system of pruning. For instance, we cut down the flowering shoots of an *Epacris* and a *Pelargonium*; but we act very differently both before and after in the two cases. The *Epacris* is hard-wooded, and, if tolerably ripened, it requires no preparation. The long branches of most kinds are cut in at once, and the plant is then transferred to a closer and warmer atmosphere, to encourage the formation of new shoots. A cold pit, kept close, is the thing; some people, with great success, keep them a couple of months in a plant stove. Of course they are duly hardened, and the wood ripened by autumn. On the other hand, the stems of the *Geranium* are soft and spongy; if a very valuable kind, this will have been increased by shading, to preserve the colour of the flower. The plant altogether is at a minimum as respects its possession of organizable material; while, for the sake of the old plant to be kept, and the cuttings for seed from its stems, it is desirable it should be at the maximum. The plants are, therefore, exposed fully to the sun; not a drop more water is given than just to keep the leaves from flagging; and the stems, instead of being soft and green, become hard and brown, by parting with their watery evapora-

tions, and assimilating fresh solid material. Many other close-headed plants, such as the Azalea, merely require, in general, the stopping of a few of the strongest shoots.

Time of Potting.—This should generally be done after pruning, and when fresh growth has taken place, because it is advisable never to give more checks to a plant at once than can be avoided. When cut down, or pruned, the energies in the stems, and the unutilized, untouched roots, are at once put forth in the production of fresh shoots. When these are formed and forming, and the plant is kept close for a time after shifting, fresh roots will soon be formed through their agency, upon the same principle that roots are protruded from a cutting of half-ripened wood under a hand-glass.

Time for Cuttings.—Now we speak merely in general terms. Other things being equal, the older and harder the wood of the cutting, the longer will it be in striking. The younger the wood is, provided it is just hard enough at the base to possess a sufficiency of organizable material, the sooner it will strike; if too soft and spongy it will rot and damp off. Hence the general time for propagating is regulated by the general time of pruning and fresh growth taking place. Small side-shoots, from $1\frac{1}{2}$ to 3 inches in length, just getting firm at the base, cut to a point with a clean, sharp knife, or taken off close to the older branch, and a few of the lower leaves removed, will succeed in the great majority of cases. It is desirable to get them in in April or May, in the case of slow-growing plants to have them established before winter. We shall merely add a few requisites: 1st, clean pots; 2nd, secure drainage by an inverted small pot inside a larger one, or by crocks so as to fill it three-quarters full; 3rd, place rough material or moss over the drainage, to prevent the finer soil washing through it; 4th, cover it with an inch or so of sandy soil, similar to that the plants delight in, if a little charcoal is added all the better, finishing with a layer of pure sand, watering all well, and then allowing it to drain before inserting the cuttings; 5th, insert the cuttings firmly, fill the small holes made by the dibber with sand, dew all over with the fine rose of a watering-pot, allow the foliage to become dry, place each pot under a bell-glass, or a number under a hand-light, and shade from the sun, either in a corner of the greenhouse, or, better still, in a close frame or pit

without any artificial heat being applied, at least none before the cutting begins to swell at its base. Some things may have bottom-heat at once, especially those that have been a little forced previously. Though shade be indispensable, yet as much light as the cuttings will endure must be given, increasing the quantity gradually.

Sowing Seeds.—This may be done at any time when the seeds are thoroughly ripe. As it is of importance to have the seedlings potted off and established before winter, April and May are the best periods in several circumstances. Where there is no hotbed the latter period will be the best, and even then, for confining heat and moisture, the pot should be covered with a bell-glass, or a square of glass laid over it. Where there is a hotbed, such as a cucumber frame, the seeds may be sown a month or six weeks earlier, and hardened off as soon as they are fairly up and potted off. In sowing, any light, sandy soil will do; for all fine hairy-rooted plants sandy peat is the best. The pots should be nearly as well drained as for cuttings, watered, and allowed to drain before sowing, as the less water they have afterwards until they are up the better. Hard seeds that have been kept dry over the winter will vegetate all the sooner for being steeped several hours in warm water, say from 13° to 14° . In covering the seeds the thickness should be regulated by the size of the seeds. Hence, for very small dusty seeds, the surface of the fine soil should be made smooth, the seeds evenly scattered over it and slightly pressed in, and then just dusted with a little fine sand; but in unpractised hands it is safer to be content with the slight pressing in with a clean, round board, having a nail in the centre to hold by, and then place a square of glass over the pot, with moss or paper above, to shade until vegetation has taken place.

After-Treatment of Cuttings and Seedlings.—This is almost identical. Neither cuttings nor seedlings, if at all thick, will thrive long in the cutting and seedling pot. The sooner they are potted off the better they will thrive. Before that, air must be given to prevent them damping; first at night; next, night, morning, and evening; and lastly, when roots are well formed, during the day, removing the glasses altogether from the cuttings. All this time the little moisture necessary must be carefully given. The less it touches either the stems or leaves, the better. When a little advanced, dust them overhead with a fine rose

watering-pot; or a syringe, but be careful to have the foliage dry before shutting up for the night. In potting off tender plants that are very small, three or four may be put round the sides of a four-inch pot; a strong-growing one into such a pot at once. In every such potting, and every time that re-shifting is necessary, a moist, close atmosphere is of importance for a short time afterwards; thus lessening, by means of shading and syringing, the evaporating processes until the roots have begun to work in the new soil, when air must be given, first gradually, and ultimately plentifully.

Green Manure is a mass of recently-growing plants dug whilst green and fresh into the soil, for the purpose of enriching it; and it is a rule without any exception that all fresh vegetable matters so turned into the earth do render it more fertile; and if plants are grown upon the soil for this purpose, the greater the amount of the surface of leaves in proportion to that of roots the better, because such plants obtain a large proportion of their chief constituent—the chief constituent of all plants, carbon—from the atmosphere. They therefore return to the soil more decomposing matter than they have taken from it.

The putrefaction of the vegetables, and the gases in that case emitted, says Mr. Cuthbert Johnson, appear to be on all occasions highly invigorating and nourishing to the succeeding crop. During this operation, the presence of water is essentially necessary, and is most probably decomposed. The gases produced vary in different plants; those which contain gluten emit ammonia; onions and a few others evolve phosphorus; hydrogen, carbonic acid gas, and carburetted hydrogen gas, with various vegetable matters, are almost always abundantly formed. All these gases, when mixed with the soil, are very nourishing to the plants growing upon it. The observations of the farmer assure us that they are so. He tells us that all green manures cannot be employed in too fresh a state.

Sea Weed is a species of green manure, for it ought to be employed whilst quite fresh. There are many species, and they differ very essentially in their components. The *Lamina'ria*, those long, tawny-green, ribbon-like algæ, so common on our coasts, contain, besides vegetable matter, a large proportion of the salts of potash in addition to those of soda; whereas the *Fuci* contain none of the salts of potash. All, however,

are excellent manures; and we know a garden, near Southampton, very productive, that for some years had no other manure. It is particularly good as a manure for potatoes. The *Fucus vesiculosus*, so distinguishable by the bladders full of air embedded in its fronds, is a very excellent manure. It contains, when dry, about eighty-four parts vegetable matter, thirteen parts sulphate of lime and magnesia, with a little phosphate of lime, and three parts sulphate and muriate of soda.

Greenweed. *Genista pilosa* and *tinctoria*.

'Greigia. (Named after Major-General Greig, a promoter of Russian horticulture. Nat. ord., *Bromeliaceæ*; Tribe, *Bromeliæ*.)

Stove epiphyte. For cultivation, see BILLBERGIA.

G. sphacelata. White and purplish. Chili. 1865. Fruit eatable. Syn., *Billbergia sphacelata* and *Bromelia clandestina*.

Grevillea consp'cua. This is *Pe-largo'nium consp'civum*.

Grevillea. (Named after C. F. Greville, a patron of botany. Nat. ord., *Proteaceæ*; Tribe, *Grevilleæ*. Allied to *Hakea*.)

Greenhouse evergreen shrubs, from Australia. Seeds sown in a slight hotbed, in spring, or in the greenhouse, as soon as ripe; cuttings of the young shoots when ripened, in sand, under a bell-glass, and when a callus has formed at the base to have a slight bottom-heat; peat and loam, with silver sand and bits of charcoal, to keep the soil open. Winter temp., 35° to 45°. *Rosmarinifolia* and *mucronulata* have stood out in sheltered places, with little or no protection.

Gre'wia. (Named after *Nehemiah Grew, M.D.*, who wrote on the Anatomy of Plants. Nat. ord., *Tiliaceæ*. Syns., *Chadara* and *Mallococea*.)

Stove and greenhouse trees and shrubs. Cuttings in sand under a bell-glass. Sandy loam and leaf-soil.

- G. asiatica*. 12. Yellow. July. E. Indies. 1792.
 — *occidentalis*. 10. Purple. July. S. Africa. 1690. B. M. t. 422.

- G. parvifl'ora*. 2-3. Yellow. N. China. 1888.
 — *sapi'da*. Yellow. Tropical Himalayas. Decumbent.

Gre'ya. (Named after *Sir George Grey*, Governor-General of the Cape Colony at the time of the discovery of this plant. Nat. ord., *Sapindaceæ*.)

Greenhouse shrub. Seeds; cuttings of the half-ripened shoots, in sand, under a hand-glass. Rich sandy loam. To make it flower well it should be periodically deprived of water for a time. Its time of flowering in its native country is August and September, a period that corresponds with our early spring. Should be exposed to full sunlight and not over-watered.

- G. Sutherla'ndi*. Crimson-scarlet. March. Natal. 1859. B. M. t. 6040.

Gri'as. Anchovy Pear. (From *grao*, to eat; the fruit being eatable. Nat. ord., *Myrtaceæ*; Tribe, *Lecythidæ*. Allied to *Gustavia*.)

Stove evergreen trees. Cuttings of ripe shoots in sand, under a bell-glass, in peat; rich sandy loam.

- G. caulifo'ra*. 50. White. Jamaica. 1768. B. M. t. 5622.
 — *zamore'nsis*. Peru. 1879.

Grie'lum. (From *grielum*, old-looking; referring to the grey, hoary aspect of the plants. Nat. ord., *Rosaceæ*; Tribe, *Neuradæ*. Allied to *Neurada*.)

Greenhouse herbaceous perennials, from South Africa, all having yellow flowers. Division of the roots in spring; rough, sandy soil, well drained.

- G. humifu'sum*. 1. May. 1825. Swt. Geran. t. 306.
 — *laciniatum*. $\frac{1}{2}$. August. 1825.
 — *tenuifo'lum*. 2. May. 1780. Swt. Geran. t. 171.

Griff'nia. (Named after *W. Griffin, Esq.*, a patron of botany. Nat. ord., *Amaryllidæ*; Tribe, *Amaryllææ*. Allied to *Eucrosia* in leaf, and to *Lycorus* in the flower.)

Stove bulbs, from South America. Seeds in a hotbed, either when ripe or early in spring, and young offset bulbs; peat and loam, with plenty of sand, and a little dried leaf-mould. Temp., when growing, 60° to 80°, with plenty of moisture; when at rest, 40° to 50°, and dry.

- G. Blumenavia*. 1. White, pink. Brazil. 1866. B. M. t. 5666.
 — *drya'des*. 1 $\frac{1}{2}$. Lilac-blue. Rio de Janeiro. 1868. B. M. t. 5786. Syn., *Amaryllis dryades*.
 — *hyacinthina*. 1. Blue. July. 1815. Syn., *Amaryllis hyacinthina*, B. R. t. 163.
 — — *micrantha*. Flowers smaller. Winter. 1880.
 — *intermedia*. $\frac{3}{4}$. Blue. April. 1823. B. R. t. 990.
 — *Libonia'na*. $\frac{1}{2}$. Blue. March. Brazil. 1848. Lem. Jard. Fl. t. 290.
 — *orna'ta*. 1. Pale lilac. February. Brazil. 1876. B. M. t. 6367.
 — *parvifl'ora*. 2. Pale purple. August. 1815. B. R. t. 511.

Grinde'lia. (Named after *H. Grindel*, a German botanist. Nat. ord., *Compositæ*; Tribe, *Asteroidæ*.)

Hardy and half-hardy plants, all with yellow flowers, and from Mexico, except when otherwise mentioned. *Ciliata* is a hardy biennial, by seeds sown in autumn, or early in spring, under protection; herbaceous species by division and cuttings; evergreens, cuttings in April of half-ripened shoots, in sand, under a bell-glass; peat and loam.

HERBACEOUS.

- G. angustifolia*. 1. August. 1822. Syn., *G. Duvalii*. *G. angustifolia* of B. R. t. 781 is *G. arguta*.
 — *ciliata*. 1½. August. N. Amer. 1821. Biennial. Syn., *Donia ciliata*.
 — *Duvalii*. See *G. angustifolia*.
 — *grandiflora*. 4. Orange. July. Texas. 1851. Biennial. B. M. t. 4628.
 — *speciosa*. 2. Yellow. Patagonia. 1852.
 — *squarrosa*. 2. August. Missouri. 1811. Syn., *Donia squarrosa*. B. M. t. 1706. Hardy.

EVERGREEN.

- G. coronopifolia*. 1½. August. 1826.
 — *glutinosa*. 2. Peru. 1803. Syn., *Donia glutinosa*, B. R. t. 187.
 — *inuloides*. 1½. August. 1815. B. R. t. 248.
 — *Lambertii*. 2. August. 1816.
 — *spathulata*. 1½. August. 1819.

Griselinia. (Apparently commemorative. Nat. ord., *Cornaceae*.)

Evergreen laurel-leaved shrubs, nearly hardy. Layers and cuttings. Light rich loam.

- G. litoralis*. 30. New Zealand. 1872.
 — *lucida*. 10. New Zealand.
 — — *macrophylla*. A large-leaved variety. 1884.

Grislea. (Named after *G. Grisley*, a Portuguese botanist. Nat. ord., *Lythraceae*. Allied to *Cuphea*.)

Stove evergreen shrubs. Cuttings in April of firm young shoots, in sandy soil, under a bell-glass, in heat; peat and loam, fibry and sandy.
G. secunda. 4. Pale pink. Venezuela. 1820.
 — *tomentosa*. B. M. t. 1906. See *Woodfordia floribunda*.

Grobya. (Named after *Lord Grey of Groby*. Nat. ord., *Orchidaceae*; Tribe, *Vandace-Cyrtopodiaceae*.) United to *Zygotetulum*.

Gronovia. (Named in honour of *Dr. John Frederick Gronovius*, a learned botanist of Leyden. Nat. ord., *Loaseae*.)

Stove or greenhouse climbing annuals. The seeds should be sown on a hotbed; when large enough, pot off singly and train upon sticks. Rich sandy loam. The hairs sting like those of a nettle, which is likewise the case with many of the *Loaseae*.

- G. pulchella*. Lilac, purple, white. Brazil. 1866.
 — *scandens*. Yellow. S. America. 1790. Jacq. Ic. t. 338.

Grotto is a resting-place, formed rudely of rock-work, roots of trees, and shells, and is most appropriately placed beneath the deep shade of woods, and on the margin of water. Its intention is to be a cool retreat during summer.

Ground Cherry. *Cerasus chamaecerasus*.

Ground Cistus. *Rhodothamnus chamaecistus*.

Ground Ivy. *Ne'peta glecho'ma*.

Ground Nut. *A'pios tuberosa*.

Ground Senna. *Ca'ssia chamaecrista*.

Groundsel Tree. *Ba'ccharis halimifolia*.

Grove is a moderately extensive association of trees without underwood. The most fitting character of a grove is beauty; for fine trees are lovely objects, and a grove is an assemblage of them, in which every individual retains much of its own peculiar elegance, and whatever it loses is transferred to the superior beauty of the whole. To a grove, therefore, which admits of endless variety in the disposition of the trees, differences in their shapes and their greens are seldom very important, and sometimes they are detrimental. Strong contrasts scatter trees which are thinly planted, and which have not the connection of underwood; they no longer form one plantation; they are a number of single trees. A thick grove is not, indeed, exposed to this mischief; and certain situations may recommend different shapes and different greens for their effects upon the surface. The eye, attracted into the depth of the grove, passes by little circumstances at the entrance: even varieties in the form of the line do not always engage the attention: they are not so apparent as in a continued thicket, and are scarcely seen if they are not considerable.

Gryllotalpa. See **Mole Cricket**.

Guaiacum. Lignum Vitæ Tree. (The aboriginal name in South America. Nat. ord., *Zygophyllaceae*.)

The Guaiacum bark of *G. officinale* is well known for its medicinal properties. Stove evergreen trees. Cuttings of ripe shoots in April or May, in sand, under a bell-glass, in brisk bottom-heat; rich, sandy, fibry loam.

- G. arboreum*. 30. Blue. Trinidad. 1816.
 — *officinale*. 40. Blue. August. W. Ind. 1694. B. R. 1839, t. 9.
 — *verticillata*. 8. Blue. W. Ind. 1820.

Guano. See **Dungs**.

Gua'rea. (The native name. Nat. ord., *Meliaceae*; Tribe, *Trichiliceae*. Allied to *Amora*.)

Stove evergreen trees. Same culture as for *Guaiaecum*.

- G. grandiflora*. 20. White. June. S. Amer. 1752. Syn., *G. trichiloides*.
 — *ramiflora*. 20. White. Porto Rico. 1822.
 — *Sua'rtzii*. 20. White. June. W. Indies. 1822.
 — *trichiloides*. See *G. grandiflora*.

Guate'ria. (Named after *Guatteria*, an Italian botanist. Nat. ord., *Anonaceae*; Tribe, *Uvarieae*.)

The flowers of *G. virgata* are exceedingly sweet. Stove evergreen trees and shrubs. Cuttings of half-ripened shoots in April, as for *Guaiacum*.

- G. cerasoides*. 16. Green. E. Ind. 1820.
 — *lavrifolia*. 8. White. Jamaica. 1818.
 — *rufo*. 3. Brown. July. China. 1822. B. E. t. 836.
 — *suberosa*. 8. White. E. Ind. 1820.
 — *virgata*. 30. White. Jamaica. 1793. Lance-wood.

Guava. (*Psidium pyrifolium*.) This stove evergreen shrub is not generally cultivated for the sake of its fruit; but it is deserving of some encouragement where hothouse room is plentiful. Its fruit, in size and appearance, somewhat resembles a small Orleans plum, and is of a dull purple colour; it is juicy, and in flavour somewhat resembles a strawberry.

Propagation is effected by cuttings, layers, and seeds.

Soil.—Two parts of loam and one part peat.

Culture.—It requires the ordinary culture given to evergreen shrubs in our stoves. As soon as the plants attain a little age they bear abundantly and in a long succession, often producing fruit through the winter. They will succeed very well in a comfortable conservatory, but a climate of an intermediate character will suit them best, as they enjoy a moderate amount of heat. They occasionally require the pruner's assistance in thinning-out crowded or cross shoots, when such occur, and in pinching the tops from those which become over luxuriant.

Fruit.—It is used for the dessert, and making jelly.

Guazu'ma. Bastard Cedar. (The aboriginal name in Mexico. Nat. ord., *Sterculiaceæ*; Tribe, *Buettneriæ*. Allied to *Theobroma*.)

The fruit of *G. ulmifolia* is full of a sweet, agreeable pulp. Stove evergreen trees. Cuttings of ripened shoots, and general treatment as for *Guaiacum*.

- G. polybotrya*. 12. Yellow. Brazil. 1816. Syn., *Bubroma polybotryum*.
 — *tomentosa*. 20. Cumana. 1820.
 — *ulmifolia*. 40. Yellow Jamaica. 1739. Syn., *Bubroma Guazuma*.

Guelder Rose. *Viburnum opulus*.

Guernsey Lily. *Nerine sarniensis*.

Guetta'rdia. (Named after *E. Guettard*, a French botanist. Nat. ord., *Rubiaceæ*; Tribe, *Guettardeæ*.)

Stove evergreen trees. General treatment as for *Guaiacum*.

- G. coccinea*. See *Isertia coccinea*.
 — *hirsuta*. 20. Peru. 1820.
 — *hucida*. See *Stenostomum lucidum*.
 — *odora*. 10. Red. Jamaica. 1818.

 — *sca'bra*. 20. White. W. Ind. 1818.
 — *speciosa*. 20. White. Madagascar and India. 1771. B. R. t. 1393.

Guevi'na. Chilian Nut. (The native name. Nat. ord., *Proteaceæ*. Syn., *Quadria*.)

Greenhouse evergreen tree. Peat and loam. Cuttings in sand under a hand-glass.

- G. Avellana*. 40. White; fruit coral red, edible. June. Chili. 1826. G. C. 1884, xxii. p. 41.

Guicheno'tia. (In honour of *M. Antoine Guichenot*, a French gardener and traveller. Nat. ord., *Sterculiaceæ*; Tribe, *Lasiopetaleæ*.)

Greenhouse shrubs. Cuttings in sand under a bell-glass. Loam and a little peat.

- G. ledifolia*. 3. White. Spring. Australia. 1868. Syn., *Lasiopetalum Baueri* of some gardens.
 — *macrantha*. 3. Purple. March. Swan River. 1847. B. M. t. 4651.

Guilandi'na. Nicker-tree. (Named after *M. Guilandinus*, a Prussian botanist. Nat. ord., *Leguminosæ*; Tribe, *Cæsalpinieæ*.) Now united to *Cæsalpinia*.

Stove evergreen shrubs. Seeds in a hotbed, in spring; cuttings, etc., as for *Guaiacum*.

- G. Bonduc*. 19. Yellow. India. 1640. Syn., *Cæsalpinia Bonduc*.
 — *Bonducella*. 8. Yellow. E. Ind. 1700. Syn., *Cæsalpinia Bonducella*.
 — *microphylla*. Brazil.
 — *Moringa*. Jacq. Ic. t. 461. See *Moringa pterygosperma*.

Guilie'ma. (Dedicated to *Queen Frederica Guilielma Carolina* of Bavaria. Nat. ord., *Palmaceæ*.)

Stove palm. Imported seeds. Rich loam and peat, with a top dressing of rotten cow-dung.

- G. utilis*. Costa Rica. 1872.

Guinea Peach. *Sarcocœphalus*.

Guinea Plum. *Parinarium excelsum*.

Gum Ammoniac. *Dore'ma ammoniacum*.

Gum Arabic Tree. *Acacia arabica*.

Gum Cistus. *Cistus ladaniferus*.

Gum Elemi Tree. *Ammyris Plumieri*.

Gum Lac Tree. *Bursera frondosa*.

Gum Senegal Tree. *Acacia Senegal*.

Gum-tree. *Eucalyptus robusta*.

Gumming. See **Extravasated Sap**.

Gunde'lia. (In honour of *Andrew Gundersheimer*, a German botanist and traveller, who lived at the commencement of the eighteenth century. Nat. ord., *Compositæ*.)

A hardy perennial. Sandy peat. Divisions and seeds.

G. Tournefortii. 1½. Chocolaté, yellow. June. From Afghanistan to Algeria. 1739. Rev. Hort. 1888, p. 53, f. 12.

Gu'nnera. (In honour of *J. E. Gunner*, a Swedish bishop and botanist. Nat. ord., *Arabiaceæ*.)

Hardy ornamental foliaged herbaceous perennials, requiring a protection of leaves in winter. Division. Rich loam.

G. brepho'gea. Greenish. Columbia. 1873.
— *manica'ta*. Leaves large, parasol-shaped. S. Brazil. 1867. Rev. Hort. 1884, t. 531.
— *perpe'nsa*. 1½. Green. August. Cape of Good Hope. B. M. t. 2376.
— *sca'bra*. 4. Green. August. Chili, 1849. Syn., *G. chilensis*. It has large rhubarb-like leaves; their acid stalks are eaten.

Gu'nnia. See *Sarcochilus*.

Gusta'via. (Named after *Gustavus III.* of Sweden. Nat. ord., *Myrtaceæ*; Tribe, *Lecythideæ*.)

There are several species of these fine stove evergreens not yet in cultivation. Cuttings of ripe shoots in sandy soil, under a bell-glass, and in bottom-heat; rich loamy soil. *G. augu'sta* is a splendid, low, evergreen tree, something like a Myrtle or a *Barringtonia*.

G. augu'sta. 10. White. Guiana. 1794.
— *brastlie'nsis*. Rosy-white. Rio Negro. 1866.
— *fastuo'sa*. 20. White. May. Guiana. 1824.
— *graci'llina*. Rose. September. Columbia. 1874. B. M. t. 6151.
— *ins'i'gnis*. 4. White. July. Columbia. 1855. B. M. t. 5069.
— *pteroca'rrpa*. White. Tropical America. 1861. B. M. t. 5239. Syn., *G. Leopoldii*.
— *Theophr'a'sta*. White. Tropical America. 1873.

Gutierrez'ia. (Probably commemorative. Nat. ord., *Compositæ*; Tribe, *Asteroidæ*.)

Hardy annual. Division. Common garden-soil.
G. gymnospermoides. 4. Yellow. September. New Mexico. 1859. B. M. t. 5155.

Guzma'nnia. (Named after *A. Guzman*, a Spanish naturalist. Nat. ord., *Bromeliaceæ*; Tribe, *Tillandsiæ*. Allied to *Caraguata*, with which it is sometimes united.)

Stove herbaceous perennial. Suckers; rich soil.

G. Bullia'na. Bright red. Summer. Andes of New Grenada. 1884. Syn., *Caraguata angustifolia*.
— *Devansaya'na*. Bracts scarlet; flowers white. Ecuador. 1882. Belg. Hort. 1883, p. 113.
— *erythroce'phala*. Chiriqua. 1883.
— *fra'grans*. See *Canistrum eburneum*.
— *Fuerstenbergia'na*. Bracts bright red; flowers white. Ecuador. 1883. Syn., *Caraguata Fuerstenbergiana*.
— *tricolor*. 1. Green, scarlet. April. S. Amer. 1820. Syns., *Tillandsia monostachya* and *T. pachycarpon*. There are varieties—*fragrans*, *grandis*, and *maculata*.

Gymnade'nia. (From *gymnos*, naked, and *aden*, a gland; the glands of the pollen-masses are naked. Nat. ord., *Orchideæ*; Tribe, *Ophrydeæ-Habenariæ*.)

This genus is scarcely distinguishable from *HABENARIA*, which see for cultivation, and in which it is included in the Genera Plantarum.

G. macra'ntha. 1. Green, flesh-colour. September. Sierra Leone. 1870. Syn., *Eulophia helleborina*.

Gymne'ma. (From *gymnos*, naked, and *nema*, a filament; in reference to the stamens. Nat. ord., *Asclepiadaceæ*; Tribe, *Marsdeniæ*. Allied to *Stephanotis*.)

G. lacti'ferum is the Cow Plant of Ceylon, the milk of which is used as food by the natives. Stove evergreen twiners, with yellow flowers. Cuttings of stiff young side-shoots in May, in sand, under a bell-glass, in heat; fibry loam and sandy peat, well drained.

G. tenaci'ssimum. See *Marsdenia tenacissima*.
— *tingens*. 8. July. Trop. Himalayas. 1823. Syns. *G. tingens*, var. *cordifolia*, Wight Ic. 593, and *Asclepias tingens*.

Gymnocla'dus. Kentucky Coffee-tree. (From *gymnos*, naked, and *klados*, a branch; in reference to the soft young wood, devoid of buds. Nat. ord., *Leguminosæ*; Tribe, *Eucæsalpineæ*. Allied to *Parkinsonia*.)

Hardy deciduous trees. By imported seeds and cuttings of the roots, keeping the part nearest the surface uppermost; deep, mellow loam. The tree has a peculiar dead-like appearance in winter, as the buds are inconspicuous, but has a fine effect in summer with its very large green leaves.
G. canadensis. 20. White. Canada. 1748.
— *chine'nsis*. 10. China. 1889. Soap tree.

Gymnodi'scus. (From *gymnos*, naked, and *discus*, a disk. Nat. ord., *Compositæ*; Tribe, *Senecionideæ*. Allied to *Othonna*.)

Hardy annual. Seeds in March or April, in any common soil.

G. capilla'ris. Yellow. June. Cape of Good Hope. 1822.

Gymnogra'mma. (From *gymnos*, naked, and *gramma*, writing; in reference to the spore-cases. Nat. ord., *Filices*.)

Beautiful stove ferns, with brown spores, except where otherwise stated. Division of the plant, and spore-cases from the fronds scattered freely on rough peat, in a pot, and covered with a square of glass, before being placed in a damp, warm, shady place; peat and loam, most of the former, with a little silver sand. Summer temp., 60° to 85°, a little shade; winter, 50° to 60°, and rather dry.

Gyne'rium. (From *gyne*, female, and *erion*, wool; the stigmas being woolly. Nat. ord., *Gramineæ*; Tribe, *Festuceæ*.)

Very ornamental grasses, hardy in the south of England. *G. argenteum*—the Pampas grass—succeeds in any deep rich soil not clayey, but flourishes best on the south side of a sloping ground, sheltered on the north and east sides. April is the best time for planting it. It requires abundance of water during the growing season, and the protection of a mat in winter north of London. If the flower-spikes are required for decorative purposes they should be gathered before the early frosts set in, or they become discoloured.

- G. argenteum*. 12. White. October. Monte. Video. 1848.
 — *purpu'reum*. Panicle purplish. 1866.
 — *juba'tum*. Chimborazo. 1878.

Gyno'xys. (From *gyne*, female, and *oxy*, sharp; alluding to the pointed style. Nat. ord., *Compositæ*; Tribe, *Senecionideæ*.)

Stove climber, with opposite leaves; suitable for trellis-work, and not liable to be attacked by insects. Cuttings. Sandy loam and peat.

G. fragrans. Yellow, white. December. Guatemala. B. M. t. 4511.

Gynu'ra. (From *gyne*, female, and *oura*, a tail; the stigma being elongated and hispid. Nat. ord., *Compositæ*; Tribe, *Senecionideæ*.)

Stove herbaceous perennial. Cuttings. Sandy loam and peat.

G. auranti'aca. Leaves tinged with bright purple. Java. 1822. Ill. Hort. t. 436.

— *bicolor.* 3. Yellow. Moluccas. 1779. B. M. t. 5123. Syn., *Cacalia bicolor*, B. R. t. 110.

Gypsum, or Plaster of Paris, is a sulphate of lime, composed of—Sulphuric acid, 43; lime, 33; water, 24. It has been employed advantageously as a manure to clover, the turnip, and potato, at the rate of 3 cwt. per acre. Potato sets are frequently rolled in it when pulverized. It has been recommended to be sprinkled in stables, and to be mixed with dung-hills, "to fix the ammonia," as it is popularly termed. All the ammonia lost in fumes from a dung-hill might be more readily and as cheaply restored to it by mixing with

it, when dug into the soil, a little of the ammoniacal liquor from the gas-works.

Gyro'mia. (From *guroma*, round; the shape of the flowers in section. Nat. ord., *Liliaceæ*.) See *Medeola*.

H.

Habena'ria. (From *habena*, a rein; referring to the long, strap-shaped spur. Nat. ord., *Orchideæ*; Tribe, *Ophrydeæ-Habenarieæ*. Allied to *Gymnadenia* and *Bonatea*. Syn., *Platanthera*.)

Some will grow in peaty soil in the open border, if kept a little protected, and somewhat dry in winter; others are stove orchids, requiring peat and loam, and treatment similar to a *Bletia*. Divisions of the root. Summer temp., 60° to 80°; rest period, in winter, 50°; and when starting into flower, 70°.

Habe'ria. (In honour of Karl Konstantin Haberle, a Professor of Botany at Pesth. Nat. ord., *Gesneraceæ*; Tribe, *Cyrtandreeæ*.)

Hardy perennial herb, a native of the Balkan Mountains. For cultivation, see *RAMONDA*, to which it is allied.

- H. rhodopensis*. †. Pale blue. Greece. 1880. B. M. t. 6651.

Habit is the appearance or mode of growth. Thus a *Verbena* may be of straggling, shrubby, or compact habit. This habit is much influenced by soil and cultivation. Thus *Buxus sempervirens* in a poor soil is dwarfish, but in a rich soil becomes tree-like. The term *habit* is applied to the power a plant possesses of vegetating earlier or later, when once accustomed to do so. Thus, a vine once forced to break early will retain the habit of doing so the following year, though not forced.

Habitat. The native place of a plant.

Habli'tzia. (After C. von Hablitz, a Prussian author and traveller. Nat. ord., *Chenopodiaceæ*.)

A hardy, climbing, deciduous herb. Garden soil. Seeds; divisions.

- H. tamnoides*. Green. Autumn. Caucasus. 1828.

Habra'nthus. (From *habros*, delicate, and *anthos*, a flower. Nat. ord., *Amaryllidaceæ*.) The species with solitary flowers are now referred to *Zephyranthes*, those with umbellate ones to *Hippeastrum*.

Habrotha'mnus. (From *habros*, gay, and *thamnus*, a shrub. Nat. ord., *Solanaceæ*; Tribe, *Cestrineæ*.) United to *Cestrum*, which see.

Greenhouse evergreen shrubs, from Mexico. *H. fasciculatus* grown against a conservatory wall, on an east or west aspect, is hardly surpassed by any in the Mexican flora. The sun is too powerful for the flowers on a south aspect; it flowers on last year's wood, and should not be pruned till after the flowers fade. They may be grown as specimens, or against pillars. Cuttings of firm side-shoots, taken off when the plant is growing, in sand, under a bell-glass, and placed in a mild bottom-heat; loam and peat, lightened with sand and charcoal. Winter temp., 40° to 48°.

- H. carminatus ruber*. Red. Garden variety. 1886.

Hackberry. *Celtis occidentalis*.

Hacquetia. (In honour of B. Hacquet, a German botanist. Nat. ord., *Umbellifereæ*; Tribe, *Saniculeæ*. Allied to *Astrantia*.)

Hardy herbaceous perennial. Division; peat and loam. Does best in a peat bed near water.

- H. epipactis*. †. Yellow. April. Alps. 1823.

Hæmadi'ctyon. (From *haima*, blood, and *diktyon*, a net; referring to the colour of the veins in the leaves. Nat. ord., *Apocynaceæ*; Tribe, *Echitidæ*.) In accordance with the law of priority this name should be superseded by *Prestonia*.

Yellow-flowered, stove, evergreen twiner, from the West Indies. Cuttings of half-ripened shoots in sand, under a bell-glass, and in bottom-heat; loam and peat, both fibry and sandy.

- H. marginatum*. 6. Yellow. 1888.
 — *nutans*. See *H. venosum*.

Hæmatoxylo. Logwood. (From *haima*, blood, and *xylon*, wood. Nat. ord., *Leguminosææ*; Tribe, *Eucæsalpinææ*.)

Stove evergreen tree. Cutting of young shoots getting firm, in sand, under a bell-glass, in heat; and seeds steeped before sowing, and then placed in a hotbed, in spring; peat and loam.

- H. campechiarum.* 20. Yellow. S. Amer. 1724. Bent. and Tr. t. 86.

Hæmodorum. Bloodroot. (From *haima*, blood, and *doron*, a gift; referring to the roots being eaten by the natives of Australia. Nat. ord., *Hæmodoræææ*; Tribe, *Euhæmodoræææ*.)

Greenhouse herbaceous plants, from Australia, with orange flowers. Division of the roots, as growth commences, in spring; peat and loam.

- H. planifolium.* 1½. August. 1810.
 — *teretifolium.* 1. August. 1822.

Ha-ha is a sunk fence, being placed at the bottom of a deep and spreading ditch, either to avoid any interruption to an expanse of surface, or to let in a desired prospect. As all deceptions are unsatisfactory to good taste, and as, when viewed lengthwise, these fences are formal and displeasing, they ought never to be adopted except in extreme cases.

Hair. See *Animal Matters*.

Ha'kea. (Named after *Baron Hake*, a German patron of botany. Nat. ord., *Proteacææ*; Tribe, *Grevilleææ*. Syn., *Mercklinia*.)

Greenhouse evergreen. Australian and Tasmanian shrubs, all with white flowers, except where otherwise mentioned. Cuttings of young shoots well ripened, in sand, over peat, and under a bell-glass, kept cool until a callus is formed, and then placed in a mild bottom-heat; peat two parts, and one of loam, with sufficiency of sand and broken freestone and pieces of charcoal, to keep the compost open. An exposed place out of doors in summer.

Hale'sia. Snowdrop-tree. (Named after *Dr. Hales*, author of "Vegetable Statics." Nat. ord., *Styracaceæ*. Syn., *Pterostyrax*.)

Hardy deciduous shrubs; by seed in spring, by layers, and cuttings of the roots in spring and autumn; require a deep, sandy, moist soil to grow them to a large, healthy size.

- H. d'ptera*. 6. White. April. N. Amer. 1758.
- *hispidata*. White. Japan. 1875. G. C. 1884, xxii. p. 177. Syn., *Pterostyrax hispidum*.
- *parvifl'ora*. 8. White. May. N. Amer. 1822.
- *tetra'ptera*. 10. White. May. Carolina. 1756.

Half-hardy Plants are those which require partial shelter, as in a cold pit or frame, during the winter. Here some attention is required to exclude from them dampness and frost, but especially the first.

Halimode'ndron. Salt-tree. (From *halimos*, sea-coast, and *dendron*, a tree; referring to its native habitat. Nat. ord., *Leguminosæ*; Tribe, *Galegeæ*. Allied to *Colutea*.)

Hardy deciduous shrubs, natives of Siberia. Grafted standard high on the Laburnum it forms one of the most graceful drooping trees that can adorn a lawn. Seeds, cuttings, and layers of the roots; common soil; if sandy and open all the better.

- H. argenteum*. 6. Pink. May. 1779. Syn., *Robinia Halimodendron*, B. M. t. 1016.
- *brachyse'ma*. 6. Pink. June.
- *subvire'scens*. 6. Pink. May.
- *specio'sum*. Siberia? 1876. Rev. Hort. 1876, p. 30.

Halle'ria. (Named after *Dr. Haller*, a botanist. Nat. ord., *Scrophulariaceæ*; Tribe, *Cheloneæ*. Allied to *Phygelius*.)

Greenhouse evergreen shrubs from South Africa. Cuttings of half-ripened shoots in sand, under a bell-glass; rich, sandy loam. They require plenty of ventilation both summer and winter.

- H. elliptica*. 6. Scarlet. May. 1816.
- *hircida*. 6. Scarlet. May. 1752.

Hal'lia. (After *Bergen Martin Hall*, a pupil of Linnæus. Nat. ord., *Leguminosæ*.)

Greenhouse perennial, sandy loam. Seeds, division, or cuttings in spring.

- H. cordata*'ta. 1. Purple. August. South Africa. Syn., *Hedysarum cordatum*. Jacq. H. Schenb. t. 296.
- *imbricata*'ta. 1½. Purple. South Africa. 1812. B. M. t. 1850 and 2596.

Hal'tica. See **Black Flea**.

Hamame'lis. Witch Hazel. (From *hama*, together with, and *mela*, fruit; referring to the flowers and fruit being on this tree at the same time. Nat. ord., *Hamamelidæ*.)

Hardy deciduous shrubs, which produce their white flowers during the winter, after the leaves have fallen. Cuttings of the roots, layers, and seeds, the latter generally requiring two years to vegetate; soil sandy and moist; male and female flowers generally on separate plants; the female flowers are the most attractive.

- H. arbo'rea*. See *H. japonica*.
- *japo'nica*. 20. Pale yellow, claret. Winter. Japan. 1862. B. M. t. 6659. Syn., *H. arborea*.
- *macrophylla*'ta. See *H. virginiana*.
- *virginiana*'ta. 10. May. N. America. 1812. B. C. t. 598. Syn., *H. macrophylla*.

Hamburgh Parsley. *Petroselinum sativum*, var. *latifolium*.

Use.—This, known also by the name *broad-leaved* and *large-rooted Parsley*, is cultivated for its root, which attains the size of a middling parsnip, boiling exceedingly tender and palatable. It is eaten both as a sauce to flesh meat, and in soups, etc.

Sowing.—Sow at monthly intervals, from February until the middle of June, thinly in drills nine inches apart. The plants appear in about a month after sowing, and require to be thinned to nine inches asunder. Frequent hoeing is the only cultivation required. By the end of July, or during August, the

earliest sowings will have acquired a sufficient size for occasional use; but the roots seldom attain their full growth until Michaelmas; and the latest crops not until the following year. On the arrival of frost, some of them must be taken up, and buried in sand, in a dry situation under cover.

To save Seed.—Some plants must be left, and allowed to run in May. Their produce will ripen in July or August. Then to be cut, dried, cleaned, and stored.

Hame'lia. (Named after the celebrated botanist, *Du Hamel*. Nat. ord., *Rubiaceæ*; Tribe, *Hamelieæ*.)

Stove evergreen shrubs. Cuttings of half-ripened shoots in the beginning of summer, in sand, under a bell-glass, and in bottom-heat; sandy peat and fibry loam.

- H. axilla'ris.* See *H. lutea*.
— *chrysa'ntha*. 8. Yellow. November. Jamaica. 1822.
— *latifo'lia*. A synonym of *H. patens*.
— *lu'tea*. 2. Yellow. August. W. Ind. 1822. Jacq. Ic. t. 335. Syn., *H. axillaris*.

— *ventricosa*. 8. Yellow. September. W. Ind. 1778.

Hamilo'nia. (Named after *Mr. Hamilton*, an American botanist. Nat. ord., *Rubiaceæ*; Tribe, *Pederiaceæ*. Allied to *Guettarda*.)

Stove evergreen shrubs, with sweet-scented flowers. Cuttings of half-ripened shoots in sand, under glass, and in a moist bottom-heat. Summer temp., when growing, 60° to 80°; in winter, when at rest, 48° to 55°; when in bloom, 55°.

- H. fruticosa.* See *Leptodermis lanceolata*.
— *sea'bra*. Pale blue. January. Nepaul. 1823.

— *suave'olens*. White. October. E. Ind. 1818. B. R. t. 348.

Hammato'phora buce'phala. Buff-tip Moth. This moth is from two or three inches across the opened fore-wings, which are silver-grey, crossed by a slender black line, and preceded by a red one near the base of the wings, several dusky bars in the middle, and with a large oval cream-coloured patch, inclosing some small buff spots; edged with a curved red line, preceded by a black one; the edges of the wings varied, black, grey, and tawny red. Hind-wings whitish; body buff, dark brown at the sides, and behind. The caterpillars are yellow, with black legs, and several rows of interrupted black stripes. Sometimes the green and black most prevail, so that the yellow seems to constitute the bands. They are found whilst young, thirty or forty together, on the leaves of the filbert during Au-

gust and September, but also on the leaves of the elm, oak, etc. The chrysalis is found in the earth; it has two small points at its tail.

Hammers for gardening purposes are made with a clawed head, for drawing as well as driving in nails. They are made of five different sizes, No. 5 being the largest. Those are best with a stud in the centre of the head, as this acts as a fulcrum in drawing nails, and prevents bruising any branch beneath the hammer during the operation.

Hanbury. See **Cabbage Diseases.**

Hand-barrow. This is useful for carrying plants, which might be damaged by the vibrations of a wheel-barrow. The form mostly used now has the stage, on which the plants are carried, on a level with the handles. There is also a form with a cage below, which is useful for carrying leaves and other litter; and when the close, movable cover is on, it serves as a conveyance for plants in large pots or tubs, which, when in flower or bearing fruit, might be too violently shaken in a wheel-barrow.

Hand-glass is a portable glass-case used for sheltering cauliflowers and other plants in winter, and during early spring, or to retain a regular supply of moisture to cuttings, or until they are rooted. The most durable and convenient are made with cast-iron framing of this form:

They are sometimes made with movable tops, as here represented; but the only advantage it affords is, that several of the lower portions may be placed upon each other to protect any tall-growing shrub in severe weather, otherwise they are more troublesome to move, and more liable to breakage than if made entire.

Hand Plant. *Cheiro'stemon*.

Hand-weeding might be banished almost from the garden, if in the kitchen department all crops were inserted in drills. This is most desirable; for the stirring of the surface consequent to hoeing is much more beneficial to the

crops, and cannot be repeated too frequently.

Hanging is when a plant is so badly inserted by the dibble, that the lower parts of the roots are in an unfilled hole, while the earth is pressed round their collar, so as to keep them suspended upright in their place.

Haploca'rpha. (From *haploos*, simple, and *karphe*, a dry scale; the pappus consists of a single row. Nat. ord., *Compositæ*; Tribe, *Arctotideæ*.)

A hardy or half-hardy perennial. Seeds or cuttings. Sandy loam in a sunny dry position.

H. Leichtlinii. 1. Yellow, stained with purple beneath. S. Africa. 1883. Syn., *Gorteria acaulis*.

Haplopa'ppus. (From *haploos*, simple, and *pappos*, down; because there is no outer pappus. Nat. ord., *Compositæ*; Tribe, *Asteroideæ*.)

Half-hardy perennial herb. Seeds, or divisions of the plants. Sandy loam.

H. spinulosus. 1-2. Yellow. August. Rocky Mountains. 1874. B. M. t. 6302. Syn., *Amellus spinulosus*.

Hardenbe'rgia. (Named after the Countess of Hardenberg, in Germany, sister to Baron Hugel. Nat. ord., *Leguminosæ*; Tribe, *Phaseoleæ*. Allied to *Kennedia*.)

Greenhouse evergreen climbers, from Australia, with purple flowers, except where otherwise mentioned. Cuttings of the young side-shoots, a little firm at their base, taken off in April, in sand, under a bell-glass, and placed in a close frame or pit without bottom-heat; peat two parts, loam one part, with sand and a little charcoal, to keep the compost open. They like a little shade in the middle of summer.

H. Comptoniana. 12. Purple, lilac. March. 1803. Syns., *H. digitata*, *H. macrophylla*, *Glycine Comptoniana* (Andr. Rep. t. 602), and *Kennedia macrophylla* (B. R. t. 1862).

— *cordata.* April. 1820.

— *digitata.* B. R. 1849, t. 60. See *H. Comptoniana*.

— *longiracemosa.* A synonym of *H. monophylla*.

— *macrophylla.* A synonym of *H. Comptoniana*.

— *Makoyana.* Rev. Hort. 1882, p. 341, fig. 74. A narrow-leaved form of *H. Comptoniana*.

— *monophylla.* 10. April. 1790. Syns., *H. cordata*, *Glycine bimaculata* (B. M. t. 263), *Kennedia cordata* (B. R. t. 944), *K. longiracemosa* (B. C. t. 1940), and *K. monophylla* (B. R. 1336).

— *ovata.* 6. April. 1820. B. M. t. 2169.

— *rosea.* White and pink. Australia. 1874.

Hardening-off. By this term gardeners intend the gradual preparation of plants to endure exposure to a colder and more airy situation. Thus, before bedding-out geraniums, or ridging-out cucumbers, in open beds, the plants that have been nursed under glass are, by degrees, exposed to more air and less warmth, by opening the lights wider,

and for a greater length of time, not only by day, but by night, until they become inured to so low a temperature as to suffer no check by being placed in the open ground.

Hardwic'kia. (Named after General Hardwicke, of the East India Company. Nat. ord., *Leguminosæ*; Tribe, *Cynometreæ*. Allied to *Cynometra*.)

Stove evergreen trees, with yellow flowers, from the East Indies. Cuttings of ripe young shoots in sandy soil, and in a brisk heat; rich, sandy loam.

H. binata. 40. March. 1820.

— *pinnata.* 40. April. 1818.

Hardy Plants are those which endure uninjured our seasons without protection.

Harebell. *Campa'nula rotundifolia.*

Hares and **Rabbits** are deterred from injuring trees and shrubs, by mixing night-soil and clay in water, and daubing it over the stems, with a brush, in November; and, if the winter proves very wet, in February. The November dressing is, however, generally sufficient. This mixture has stopped their depredations entirely, even when they had commenced operations.

Hare's-Ear. *Bupleu'rum.*

Hare's-Fern. *Dava'llia canariensis.*

Hare's-Foot. *Ochro'ma logo'pus.*

Haricot. See **Kidney Bean.**

Harina. (From the Indian name. Nat. ord., *Palmeæ*; Tribe, *Areceæ*.) See **Wallichia.**

Haro'nga. (From *rongo*, the name in Madagascar. Nat. ord., *Hypericaceæ*; Tribe, *Vismicæ*.)

Evergreen stove shrub. Cuttings of young shoots getting a little firm, in sandy peat, under a bell-glass, in heat; sandy loam and peat.

H. madagascariensis. 10. Yellow. July. Madagascar. 1825. Syn., *H. paniculata*.

Harpa'lium. (From *Harpalyce*, daughter of Lycurgus. Nat. ord., *Compositæ*; Tribe, *Helianthoideæ*.) Most of the species of this genus are now included in *Vigniera*, but the only one in cultivation (*H. rigidum*) is known as **Helianthus rigidus**, which see.

Harra'chia. (In honour of Count von Harrach, an Austrian nobleman. Nat. ord., *Acanthaceæ*; Tribe, *Justicieæ*.) United with **Crossandra**.

H. speciosa. A synonym of *Crossandra infundibuliformis*, var. *peduncularis*.

Harriso'nia. (Named in honour of Mrs. Harrison, of Liverpool, its intro-

ducer. Nat. ord., *Asclepiadaceæ*; Tribe, *Marsdeniææ*.) See *Marsdenia*.

H. loniceroides. B. M. t. 2699. See *Marsdenia loniceroides*.

Harto'gia. (Named after *J. Hartog*, a Dutch naturalist. Nat. ord., *Celastrinææ*; Tribe, *Celastrææ*. Allied to *Elæodendron*.)

Evergreen shrub, from South Africa. Cuttings of the ripe shoots under a bell-glass; sandy loam and peat. Usually grown in the greenhouse, but may stand out of doors in sheltered places in the south.

H. cape'nsis. 6. July. 1800.

Hart's Tongue. *Scolope'ndrium*.

Hartwe'gia. (Named after *M. Hartweg*, court gardener to the Emperor of Austria, once a botanical collector for the Horticultural Society. Nat. ord., *Orchidææ*; Tribe, *Epidendrææ-Lælicææ*.)

Stove orchids. Division of the plant in spring; very fibry peat, potsherds, and charcoal.

H. crassifo'lia. Purple. April. Guatemala. 1840.

— *ge'mma*. Amethyst. 1878.

— *purpu'rea*. 1. Purple. August. Vera Cruz. 1837.

— — *angustifo'lia*. 1. Purple. June. Mexico. 1842.

Hassagay-tree. *Curti'sia*.

Hasti'ngia. (In honour of *Warren Hastings*, once Governor-General of India. Nat. ord., *Verbenacææ*; Tribe, *Viticeææ*.) See *Holmskioldia*.

Hatchet-vetch. *Bise'rulla*.

Hautboy or **Hautbois.** See **Strawberry.**

Hawk-fly. See **Scæva.**

Hawkweed. *Hiera'ceum*.

Hawo'rthia. (Named in honour of *A. H. Haworth, Esq.*, a distinguished English botanist. Nat. ord., *Liliacææ*; Tribe, *Aloineææ*.)

For culture, etc., see **ALOE**, to which it is closely allied. They are natives of South Africa, some, however, are of garden origin, and all have grey flowers.

Hawthorn-butterfly. *Pieris*.

Haylo'ckia. (Named after Mr. Haylock, gardener to Dr. Herbert. Nat. ord., *Amaryllidæ*; Tribe, *Amaryllææ*. Allied to *Sternbergia*.)

A small bulb, with very narrow leaves and one flowered scape. Offsets; sandy loam, with a little peat and leaf-mould; requires the protection of a frame, or to be deeply planted in a dry place in winter.

H. pusilla. $\frac{1}{2}$. Straw. March. Buenos Ayres. 1829. B. R. t. 1371.

Hazel. *Corylus avellana*.

Heading, or as it is also termed, *Cabbaging* or *Loaving*, is an inaptitude to unfold the central leaves, characterizing the various members of the Cabbage tribe. They have their centre, composed of a larger number of leaves than usual, and these, in some instances, are so complexly combined that weak plants have not sufficient power to force them open. The closeness of the heading is regulated by the exposure to the light. In a shady situation all the leaves are required to elaborate the sap, on account of the deficient light rendering each less active; therefore they open as they are formed. In a free exposure a few leaves are able to effect the requisite decomposition; and hence the reason why cabbages always have "*harder hearts*" in summer than in spring or autumn, when the light is less intense.

Heading-down, is cutting off entirely, or to a considerable extent, the branches of a tree or shrub—a process not to be resorted to rashly, and adopted only to reduce them when the plant seems declining in vigour, or has attained an undesirable size.

Heart's-ease. See *Pansy*.

Heat is the prime agent in the development of all vegetable life, in effect-

ing all vegetable changes, and in ripening all vegetable produce. All these effects are performed most efficiently, in the case of every plant, at some different temperature or degree of heat; and he who ascertains most correctly those heats has taken a gigantic step towards excellence as a gardener. An uncongenial heat is as pernicious to vegetables as to animals. Every plant has a particular temperature, without which its functions diminish or cease; but the majority of them luxuriate most in a climate of which the extreme temperatures do not exceed 32° and 90°. No seed will vegetate, no sap will circulate, in a temperature at or below the freezing point of water. No cultivation will render plants, natives of the torrid zone, capable of bearing the rigours of our winters. Others are capable of resisting the greatest known cold to which they can be exposed; yet all have degrees of temperature most congenial to them, and if subjected to lower temperatures, are more or less injured proportionately to the intensity of that reduction. If the reduction of temperature be only slightly below that which is congenial, it merely causes the growth of the plant to diminish and its colour to become more pale; this effect being now produced by the plant's torpidity, or want of excitement to perform the requisite elaboration of the sap, as it is by over-excitement when made to vegetate in a temperature which is too elevated.

If blossoms are produced at all, they are unfertile, and the entire aspect of the plant betrays that its secretions are not healthy, and its functions are deadened. Mr. Knight says, "that melons and cucumber plants, if grown in a temperature too low, produce an excess of female blossoms; but if the temperature be too high, blossoms of the opposite sex are by far too profuse." The drier the air the greater is the amount of moisture transpired; and this becomes so excessive, if it be also promoted by a high temperature, that plants in hothouses, where it has occurred often, dry up as if burned. Mr. Daniell has well illustrated this by showing, that if the temperature of a hothouse be raised only five degrees, viz., from 75° to 80°, whilst the air within it retains the same degree of moisture, a plant that in the lower temperature exhaled fifty-seven grains of moisture, would, in the higher temperature, exhale one hundred and twenty grains in the same space of time.

Plants, however, like animals, can

bear a higher temperature in dry air than they can in air charged with vapour. Animals are scalded in the latter if the temperature is very elevated, and plants die under similar circumstances, as if boiled. MM. Edwards and Colin found kidney-beans sustained no injury, when the air was dry, at a temperature of 170°; but they died in a few minutes if the air was moist. Other plants under similar circumstances would perish probably at a much lower temperature; and the fact affords a significant warning to the gardener.

Certain plants flourish in hot-water springs, of which the temperature varies between the scalding heats of from 150° to 180° Fahrenheit, and others have been found growing freely on the edges of volcanoes, in an atmosphere heated above the boiling point of water. Indeed, it is quite certain that most plants will better bear, for a short time, an elevated temperature, which, if long continued would destroy them, than they can a low temperature. Thus a temperature slightly above the freezing point of water, to orchidaceous and other tropical plants, is generally fatal if persisted in; whereas a considerable elevation above a salutary temperature is rarely injurious to plants. But this is not universally the case; for the elegant *Primula marginata* is so impatient of heat, that, although just about to bloom, it never opens a bud if brought into a room in which there is a fire.

The temperature should always be regulated, in our hothouses, with a due regard to the light. At night it should be so low as to put the circulation of the sap into a comparative state of rest; and in dull days the temperature should be full 10° lower than in those of bright sunshine.

Heaths. See *Eri'ca*.

Propagation: by Cuttings.—In order to be successful in striking the *hard-wooded heaths*, it is necessary to put a plant of each kind in gentle heat, to cause them to push forth young shoots. Whilst they are growing, the materials for the operation of propagation should be prepared: these are the requisite number of clear *bell-glasses*. It will be advantageous to have them of different sizes; the smallest 3½ inches, and the largest 6 inches diameter, with two sizes between. Also prepare the *drainage* by breaking a quantity of potsherds. These should be in three sizes, the largest about an inch across, the next half an

inch, and the smallest the size of marrow-fat peas, with the dust sifted out from amongst them. Next, have the *soil* ready. The best is to be had from some dry moorland where the heather grows wild. Break the turves into a fine state, and pass it through a fine sieve, reserving the rougher pieces to cover the drainage with. The next things to look after are the *pots*. If new, they must be placed in a tub of water for a few hours; if old, they must be well scoured and made perfectly clean. Lastly, procure a sufficient quantity of pure *silver sand*, a pair of *propagating scissors*, and a small ivory-handled *knife*. All these being in readiness, see that the cuttings are in a fit state to take off the plants. If they have made fresh shoots an inch long, they are ready for use. Then take a small clean pot, invert it, and place it over the hole at the bottom of the pot for the cuttings, then fill in round a few of the largest potsherds, and cover them with some of the second size, and then, lastly, with a considerable quantity of the smallest size, cover these with a layer of the rough siftings. The whole of these should fill the pot to within two and a half inches of the rim of the pot. Upon that place an inch and a half of the heath mould, with a large admixture of the silver sand; level this last layer with a circular piece of wood, with a nail driven into the centre, to form a handle. Finish with a layer of the pure white sand quite level with the rim of the pot. Give a good watering with a fine rose pot, to settle the same. Then take off the cuttings with the scissors, and dress them with the knife; cut the bottom of the cutting clean off with a level cut, just at the part between the new and the old wood; then cut off the leaves close to the stem, without wounding its bark, about two-thirds of its length from the bottom. As each cutting is made, place it under the bell-glass upon the sand, till a sufficient number are made to fill the pot. Make a mark in the sand to show the size of the glass, and then proceed to put in the cuttings in regular rows across the pot, keeping the leaves just clear out of the sand. When they are all planted, give another gentle watering, to settle the sand firm; allow them to dry partially before the glass is put on. Then place them in a house where they can be shaded from the sun, and keep up a gentle heat of 55°, as near as possible. Wipe the glasses dry every morning, and as soon as the cuttings are

rooted, remove them into a cooler-house, and give a little air by placing three short pieces of wood, a quarter of an inch thick and two inches long, so as to form a triangle, and let the bell-glass rest upon them. In this house it will still be necessary to shade them from the blazing sun. This is easily done by spreading some sheets of paper over them; but remove this shade instantly when the sun is overclouded. When they have been in this situation for a month, remove the glasses entirely, and a month afterwards commence potting them off in 3-inch pots, four in a pot, stopping them at the same time, to make them bushy. Place them in a cold frame, upon a layer of river-sand on coal-ashes; shade again for a time, and give air moderately. When they have made fresh roots expose them occasionally to gentle showers, but by no means to heavy rain. Give them due supplies of water in dry weather, and keep them clear of weeds. In these pots they must remain till the spring following. During the winter place them on a shelf, near the glass, in a tight, airy greenhouse. About March, pot them singly into the same sized pots, shading them again till fresh roots are formed. They are then ready for the usual routine of culture. Heaths, with *soft wood* and free growth, are more easy to propagate, and do not require so much preparation; but in other respects the management is the same.

By Seed.—Several kinds of heaths produce plenty of good seed; even some that are extremely difficult to propagate any other way, such, for instance, as *E. elegans*, *E. odo'ra ro'sea*, *E. halicaca'ba*, *E. triu'mphans*, and some others of similar habit. Fill the pots in the same way as for cuttings, only mix the top layer of sand with as much heath-mould; make the surface smooth, and sow the seed in spring on the surface, covering it as slightly as possible; water with the finest syringe, so that it may fall upon the seed like the finest dew; place the pots near the glass, shade from bright sun, and keep the surface just moist. The seedlings will soon come up, and require great care, or they will fog off. To prevent this give air daily. As soon as they can be handled transplant them into 5-inch pots rather thickly, but standing clear of each other. In this state they may remain for six or eight months, and then pot them off into 3-inch pots, four in a pot, and manage them afterwards in the same way as the cuttings.

Soil.—This has been already described above, in writing of the soil proper for the cuttings to root into; but for larger plants it must not be sifted so fine. For very large plants do not sift it at all; for such, if a few pieces of sand-stone are mixed amongst the mould, they will be useful to allow the water to penetrate to the centre of the ball.

Potting.—Heaths thrive best if the mould is left below the rim of the pot from half an inch for small plants in 6-inch pots, to two inches in large ones. This space holds a supply of water which gradually sinks through, and effectually moistens the ball to the centre. Drain thoroughly with broken potsherds, half an inch for small plants, to three inches for very large ones.

Culture.—Cold pits or frames, in spring and autumn, are the best protection to place heaths in during their youth, and a good, airy, light, span-roofed greenhouse for them through winter and spring, when they are too large for the frames. In summer they should be set out of doors upon a thick bed of coal-ashes, behind a low wall or hedge. Whilst in this position they must have an abundant and constant supply of water. If the ball ever becomes thoroughly dry, the plants will certainly die; therefore, attend to this point of watering most rigidly and perseveringly. In winter they do not require so much; but even in that season they must be kept moderately, but constantly and thoroughly moistened.

Diseases.—Heaths are subject to go off at the point where the stem ends and the roots begin. This is caused often by an irregular supply of water, and cannot be cured when it once takes place. The plant may appear green and flourishing, and the roots fresh, and the ends are lively even when the stem is dead. Another fell disease is the *mildew*. This may be sometimes cured by first damping the plants infected, and then dusting them over with flowers of sulphur. This disease is often brought on by a long-continued damp atmosphere; and if that is not dried by a little heat, with abundance of air, the disease will spread rapidly, and soon destroy the plants. If only one or two are infected, they had better be sulphured, and placed by themselves till the mildew fungus is killed.

Insects.—See **Aphis** for cure, when the Green Fly attacks them.

Heath-mould. See **Bog-earth**.

Heather. *Callu'na vulga'ris*.

Hebecladus. (From *hebe*, pubescence, and *klados*, a branch; in reference to the hairiness of the young shoots. Nat. ord., *Solanaceæ*; Tribe, *Solanaceæ*.)

Stove shrub. Half-ripened cuttings, in sand, under a bell-glass and in bottom-heat. Rich sandy loam and leaf-mould.

H. ventricosus. 3. Pale yellow. Peru. 1869. B. M. t. 4192.

Hebeclinium. See **Eupatorium.**

Hebenstreitia. (Named after Professor *Hebenstreit*, of Leipsic. Nat. ord., *Selaginaceæ*. Allied to *Selago*.)

Most of the Cape Selagids are well adapted for planting out in summer, in mixed borders. Greenhouse evergreen shrubs or annuals; all from South Africa, and all white-flowered. Short young shoots in sandy peat, in spring, under a bell-glass; sandy, fibry loam, and a little peat; *denta* by seed in early spring.

— *thymoides*. ½. Red. July. France.

Hedera. The Ivy. (*Hedra* is the Celtic word for cord, alluding to the Ivy's stems. Nat. ord., *Araliaceæ*.)

The common ivy (*H. helix*) may be propagated by seeds, but in all its varieties is quickest propagated by slips, inserted in a north border, in sandy soil, kept moist in the autumn. This is a far better plan than inserting it at once where it is intended to remain. Deep, rich soil suits the common ivy; the tender kinds should have lighter soil. For clothing dead trees, covering open fences, giving an air of antiquity, security and warmth and dryness to buildings, and even producing architectural effects, and covering the ground in shady places with a green carpet, where scarcely anything else would grow, the ivy is invaluable.

Hedge properly includes every kind of fence; but the present details apply, for the most part, to growing fences. Abercrombie says, that all outward hedges designed as fences should have a ditch on the outside, three or four feet wide at top, three deep, sloping to one wide at bottom, raising a low bank on the inside on which to plant the hedge. Having lined out the width of the ditch, then along the inner edge lay a row of square spit turves, grass side downwards, to form the beginning of the bank, backing it up with spits of earths from the formation of the ditch, and top it with a little of the fine mould or crumbs; and then upon this proceed to lay the first row of plants. First let the

sets be headed to about five or six inches, and the roots trimmed; then lay them upon the bed of turf with their tops outward, in an upward direction, about ten or twelve inches asunder, covering their roots with mould, also out of the ditch; and then lay another row of turf along upon the necks of the plants, and more mould from the ditch upon and behind the turf; and when the bank is thus raised a foot above the row of sets, plant another row in the same manner, placing each set against the spaces of those of the first row, so covering them with more earth from the ditch to the depth of three feet, sloping each side to one foot width at bottom, and trim up all remaining earth, throwing a sufficiency behind the top of the banking to bank up the whole evenly. But in planting for an outward fence, some form the ditch and bank first as above, and plant the sets in two rows along the top; that is, after having formed the ditch and bank, then levelling the top, forming a foot of border all along a yard wide; plant the sets along its middle upright, in two rows a foot asunder, and six inches distant in each row, observing the same when intended to raise a hedge at once from seed sown where you design the edge to be, sowing them along the top in drills a foot asunder. Sometimes, when hedges are designed for middle fences to divide fields, a two-sided bank is raised a yard high, and as broad at top, having a slight ditch on each side; and each side of the bank is formed with square spit turves from the adjoining ground, and the middle filled up with mould from the ditches on each side; so that when finished, it forms a yard-wide border all the way along the top, and along the middle of which plant two rows of hedge-sets or seeds, in drills, as before observed. But in places where no ditch nor raised bank is required, as may be the case for middle hedges in the interior parts of grounds, especially in gardens, then the place for the hedge being marked out on the level ground two or three feet broad, dig it along one good spade deep at least, and then plant your sets of any sort in two rows, ranging along the middle; or, if you design to sow seeds, etc., of any sort at once, where you intend to have the hedge, sow them in two drills a foot asunder the whole length.

In respect to general culture of these sorts of hedges it must be remarked, that all such as are exposed to cattle must, as soon as planted, be fenced either with a stake and bush hedge, with hurdles, or

with rails and open paling, for four or five years, till the hedge grows up, observing not to place the fence too close to the hedge to interrupt its growth. The hedge must, also, be duly weeded while young, and this should be particularly attended to the first two years.

Evergreen Hedge-shrubs are Holly, Yew, Laurel, Viburnum laurustinus, Phillyrea, Alaternus, Bay, Furze, and Evergreen Oak; but the Holly and Yew form the best hedges for general use.

Deciduous kinds.—Hawthorn, Blackthorn, Crab, Elder, Hornbeam, Beech, Elm, Lime-tree, and Alder are all proper either for middling or tall hedges, as they may be trained up from about six or eight to fifteen or twenty feet high, and the Elm to double that height if required. Privet is also sometimes used for moderately high hedges; and for low hedges, the Rose, Sweet-briar, Syringa, and Barberry.

All full-trained hedges, in order to preserve them in proper form, must be clipped, both on the sides and top, once or twice a year, but never less than once; and the best time of the year for this work is summer, from about the middle or latter end of June to the end of August, for then the hedges will have made their summer shoots, which should always, if possible, be clipped the same season while in leaf, and before the shoots become hard, whereby you will be able to perform the work more expeditiously and with greater exactness, for regular hedges should be cut as even as a wall on the sides, and the top as straight as a line; observing, after the hedge is formed to its proper height and width, always to cut each year's clipping nearly to that of the former year, particularly on the sides; for by no means suffer them to grow above a foot or two wide, nor suffer them to advance upon you too much at top, where it is designed or necessary to keep them to a moderate height. But to keep hedges in perfectly good order, they should be clipped twice every summer; the first clipping to be about Midsummer, or soon after, when they will have made their summer shoots; and as they will shoot again, what may be called the autumn shoot, the second clipping is necessary towards the middle or latter end of August, and they will not shoot again that year. However, when it does not suit to clip them but once in the summer, the clipping should not be performed until the beginning of August; for, if cut sooner, they will shoot again, and appear

almost as rough the remainder of the summer and all winter as if they had not been clipped. Very high hedges are both troublesome and expensive to cut. The clipping is sometimes performed by the assistance of a high machine, scaffolding, or stage, twenty or thirty feet high or more, having platforms at different heights for the men to stand upon, the whole made to move along upon wheels. It is composed of four long poles for uprights, well framed together, eight or ten feet wide at bottom, narrowing gradually to four or five at top, having a platform or stage at every seven or eight feet high, and one at the top of all; and upon these the man stands to work, each platform having a rail, waist high, to keep the man from falling, and a sort of ladder formed on one side for the man to ascend, and at bottom for low wheels to move it along. Upon this machine a man may be employed on each stage or platform, trimming the hedge with shears, and sometimes with a garden hedge-bill fixed on a handle five or six feet long, which is more expeditious, though it will not make so neat work as cutting with the shears.

A hedge is not only an imperfect screen, but in other respects is worse than useless, since nothing can be trained to it, and its roots exhaust the soil in their neighbourhood very considerably. As the south fence of a garden, it may be employed; and hawthorn, in some respects, is the worst shrub that could be made use of. It is the nursery of the same aphides, beetles, and caterpillars, that feed upon the foliage of the apple and pear, from whence they often spread to the whole garden. Evergreen are better than deciduous hedges, and more especially those of the holly, which is not so slow a grower as is generally imagined.

In a cloudy day, in April or May, the wind seems to be actually refrigerated in passing through a thick hawthorn hedge; and this may be accounted for on the same principle that cool air is obtained in the houses of India by sprinkling branches of trees with water in their verandas. Holly, laurel, and most evergreens, exhale but little moisture from their leaves, except for about a month in June: consequently, in April and May, when we most require warmth, and in September and October, the leaves of these, when fully exposed to the sun, become heated to the touch to 85° or 90°. Added to this, hoar frost, or a deposition of moisture of any kind, never

attaches so readily, or remains for so long a time, upon the foliage of evergreens as upon the sprays of deciduous shrubs; consequently, the refrigeratory power is greatly diminished. When the garden is of considerable extent, three or four acres and upwards, it admits of cross-walls or fences for an increase of training surface and additional shelter.

Hedges should always be clipped into a conical form, as the diminution of the branches towards the top increases their development at the bottom.

Furze makes one of the best and handsomest of hedges if kept regularly clipped. Upon the formation of such a hedge, we have the following remarks by Mr. McL., of Hillsborough:—The most ancient, and perhaps the most simple of all fences, are walls made of turf. These walls, however, are much injured by the atmosphere, and the rubbing and butting of the cattle. To guard against this they should be planted or sown with the *Ulex europæus*, or *Furze*. The roots of this plant will soon penetrate the turf, and tend to bind the wall. The plants not only afford shelter as well as food for the cattle, but add to the height of the wall, and give it a formidable appearance. When walls are made for this, the foundation should be three feet wide, and tapering to fifteen inches at top. As the plants advance in growth, they should be regularly trimmed with the shears: by proper attention to this they will be prevented from growing too tall and thin at the bottom. If this is annually repeated, the plants will be longer preserved in a healthy and vigorous state: clipping has also a good effect in checking the *furze* from spreading over the field. A good and substantial fence may thus be quickly formed on a soil that will not produce a biding fence of any other kind.

Sweet-briar (*Rosa rubiginosa*) makes a good hedge. Its seeds may be sown in the autumn, as soon as ripe, or, which is better, in the month of March, having kept them, in the mean time, mixed with sand. But it is far more convenient to buy young plants, and to plant them a foot apart early in the month of November. Let them grow as they like for the first year, and cut them down to the ground the second; they will then spring up and require no more care than occasionally trimming with the pruning-knife or shears to keep the hedge in shape. When it gets naked to the bottom, it must be again cut down.—*Gard. Chron.*

Hedge-hog Thistle. *Ca'ctus* (*Echinoc'ctus*).

Hedge Hyssop. *Grati'ola*.

Hedge Mustard. *Ery'simum*.

Hedge Nettle. *Sta'chys*.

Hedwigia, of Swartz. (Named after John Hedwig, a botanist. Nat. ord., *Bursereaceæ*; Tribe, *Bursereæ*. Allied to *Bursera*.)

Closely allied to the Orange tribe. *Beaume a suerier*, a substitute for Copaiva, is obtained from *balsami'fera*. Stove evergreen trees. Cuttings of ripe shoots in sandy soil, and in a good heat; sandy loam and a little peat.

H. balsami'fera. 40. White. August. W. Ind. 1820.

Hedychium. (From *hedys*, sweet, and *chion*, snow; in reference to the sweet-scented, snow-white flowers of *H. ma'ximum* and *corona'rium*, the best two garden-plants of the genus. Nat. ord., *Scitamineæ*; Tribe, *Zingiberæ*.)

Stove and greenhouse herbaceous plants. Division of the plants before fresh potting them; loam and peat, with a portion of sand and dried cow-dung. They must have plenty of water and light when growing. It should be tried to give them their rest period by keeping them cooler and drier in winter, and, if well grown before, the advancing heat in spring and summer will bring up the beautiful flowers. Summer temp., 60° to 85°, with moist atmosphere when growing, cooler and drier when flowering; winter, 50° to 55°.

Hedysce'pe. (From *hedys*, sweet, and *skepe*, a covering. Nat. ord., *Palmeæ*.)

A stove palm, cultivated in the same manner as *KENTIA*, which see.

H. Canterburyana. 30. Yellowish. Lord Howe's Island. Syn., *Kentia Canterburyana*.

Heel. When a cutting is taken off with a small portion of the older wood from which it sprang, that older portion is called the heel.

Hee'ria. (After *Oswald Heer*, a Swiss botanist. Nat. ord., *Melastomaceæ*; Tribe, *Osbeckiaceæ*. Syn., *Heterocentron*.)

Stove evergreen shrubs. Cuttings of young shoots in sandy peat, under a bell-glass in spring. Sandy loam and fibry peat.

H. rosea. Pink. June. Mexico. Syns., *Heterocentron mexicanum*, B. M. t. 5166, and *H. roseum*, Ill. Hort. t. 97.

— *subtripliné'ria*. White. June. Mexico. 1824. Syn., *Heteronoma subtriplinervium*.

Hei'mia. (Named after *Dr. Heim*, a German. Nat. ord., *Lythraceæ*.) See *Nesæa*.

H. myrtifolia. See *Nesæa myrtifolia*.
— *salicifolia*, and its var. *grandiflora* (B. R. 1841, t. 40). See *Nesæa salicifolia*.

Hei'nsia. (Named after *M. Heinsius*. Nat. ord., *Rubiaceæ*; Tribe, *Hamelieæ*.)

Stove evergreen shrub. Cuttings of young shoots in sand, under a bell-glass, and in a brisk bottom-heat; fibry peat and sandy loam, with a little dried leaf-mould.

H. jasminiflora, 4. White. March. Sierra Leone. 1824. B. M. t. 4207.

Hei'ntzia. (In honour of *M. Heintz*. Nat. ord., *Gesneraceæ*; Tribe, *Cyrtandreeæ*.)

Stove evergreen. Moist atmosphere. Sandy loam, turfy peat, and decayed leaves in equal quantities, thoroughly mixed but unsifted.

H. tigrina. 5. White, pink. Caraccas. 1852. B. M. t. 4774. Now known as *Alloplectus tigrinus*.

Heiste'ria. Bois Perdrix. (Named after *L. Heister*, a Swedish botanist. Nat. ord., *Oleaceæ*; Tribe, *Oleaceæ*. Allied to *Olaç*.)

This is the source of the Partridge-pea of Martinique, but not of the Partridge-wood, as has been erroneously asserted. Stove evergreen tree. Cuttings of firm young shoots in a brisk heat; sandy loam and a dash of peat.

H. coccinea. 20. Scarlet. Martinique. 1822.

Hel'cia. (From *helcium*, a horse-collar; in reference to the curious formation of the flowers. Nat. ord., *Orchideæ*; Tribe, *Vandeeæ*.) United to **Trichopilia**.

H. sanguinolenta. Rehb. Xen. ii. t. 131. See *Trichopilia sanguinolenta*.

Hele'nium. (Named after the beautiful *Helena*, cause of the Trojan war. Nat. ord., *Compositæ*; Tribe, *Helenioideæ*.)

Hardy herbaceous perennials, with yellow flowers. By division of the plant in spring; common garden-soil. There are some annuals and biennials, but not deserving cultivation.

Helia'mphora. (From *helios*, the sun, and *amphora*, a pitcher. Nat. ord., *Sarraceniaceæ*.)

Greenhouse herbaceous perennial. Divisions; seed, peat, sphagnum and crocks.

H. nutans. 1-2. White or pale rose. Roraima, British Guiana. 1883. B. M. t. 7091.

Helia'nthemum. Sun Rose. (From *helios*, the sun, and *antheion*, a flower. Nat. ord., *Cistineeæ*.)

If gardeners would turn their attention to these Rock-roses, and cross them judiciously, they might expect in time to produce a race which would rival the Verhenas. Annuals, by seeds in the open border, in April. A few of the best shrubby ones are rather tender, and young plants might be saved in a cold pit. Shrubby evergreens, by inserting little pieces of ripened and half-ripened shoots with the leaves attached, in June, in sandy soil, in a shady place, under a hand-light. Few things can surpass the beauty of these plants when trailing over stones, and banks, and rock-works, in spring and summer. In such positions, the tenderest merely require, at times, an evergreen branch, placed over them in winter; sandy loam, with a little peat, suits them well.

Helianthus. Sunflower. (From *helios*, the sun, and *anthos*, a flower; in reference to the opinion that the flowers turn round after the sun. Nat. ord., *Compositæ*; Tribe, *Helianthoideæ*.)

Hardy herbaceous plants, all yellow-flowered; well fitted for the back of flower-borders and the front of shrubberies, where such modes of planting prevail. The annuals, such as the common Sunflower, should be sown in a slight hotbed, and afterwards transplanted; the perennials must be divided in the spring; common, good soil; a few of the tenderest want a little protection in very cold and wet winters.

Helichrysum. (From *helios*, the sun, and *chrysos*, gold; referring to the beauty of the flowers. Nat. ord., *Compositæ*; Tribe, *Inuloideæ*. Allied to *Helipterum*.)

Many may be raised from seed; others, such as hardy and greenhouse herbaceous, by division and cuttings in spring, in sandy soil, under a hand-glass; evergreen shrubs from the Cape, if small side-shoots are taken off when getting firm at their base, will strike freely in sandy, peaty soil, under a bell-glass; peat and loam, three of the former to one of the latter. *Stæchas* is the hardiest shrubby kind, flourishing in a sheltered place in dry, calcareous soil. *Angustifolium*, *congestum*, and *fruticosum* are the next in point of hardness, and probably would do on a South wall.

STOVE PERENNIAL.

- H. Mannii*. 2. White, yellow. September. Cameroon Mountains. 1864.

Helico'dea zebri'na. A synonym of **Billbergia zebrina**.

Helicod'ceros. (From *helix*, spiral, *dis*, twice, and *keras*, a horn; because the basal divisions of the leaf twist and stand erect, and thus somewhat resemble horns. Nat. ord., *Araceæ*; Tribe, *Arineæ*.)

Hardy tuberous perennial herb; it requires the protection of a frame in severe winters. For cultivation, see *ARUM*, to which it is allied.
H. crinitus. 1-1½. Dark purple-brown. April. Corsica. 1777. Syn., *Arum crinitum*. B. R. t. 831.

Helico'nia. (From *helicon*, a hill, consecrated to the Muses; in reference to the affinity of this genus to *Musa*. Nat. ord., *Scitamineæ*; Tribe, *Musæ*.)

The fleshy roots of *H. psittacorum* are eatable. Stove herbaceous perennials. Division of the roots; strong, rich, loamy soil. Summer temp., 60° to 90°, with plenty of moisture; winter, 50° to 60°.

- H. angustifolia*. Red, white. January. Brazil. B. M. t. 4475.
 — *aurantiaca*. 1½. Cream, orange. Mexico. 1862.
 — *aureo-striata*. Leaves deep green, with yellow veins. Solomon Islands. 1831. Ill. Hort. t. 464.

 — *metallica*. Crimson; leaves metallic purple beneath. New Grenada. 1862.
 — *nitens*. Mexico.
 — *psittacorum*. 4. Orange. August. W. Ind. 1797. Andr. Rep. t. 124.
 — *pulverulenta*. 2. Greenish-scarlet. July. S. Amer. 1830. B. R. t. 1643.
 — *Swartziana*. 4. Yellow. July. Jamaica. 1800.
 — *triumphans*. Leaves dark green, with blackish veins. Sumatra? 1833. Ill. Hort. t. 448.
 — *vinosa*. Columbia. 1871.
 — *viridis*. Polynesia.

Helicophyllum. (From *helix*, *helikos*, spiral, and *phullon*, a leaf. Nat. ord., *Araceæ*.)

Hardy perennial. Same treatment as the hardy *Arums*.

- H. Alberti*. Spathes pale green outside, brown-purple within. Central Asia. 1887. B. M. t. 6969.

Helic'teres. (From *helikter*, a twisted bracelet; alluding to the shape of the fruits. Nat. ord., *Sterculiaceæ*; Tribe, *Helictereæ*.)

Stove trees or shrubs. Cuttings taken off at joint in sand under a bell-glass. Fibry loam and peat.

- H. iso'ra*. 6. Scarlet. September. E. Indies. B. M. t. 2061.
 — *jamaicænsis*. White. Autumn. Jamaica. 1757. Jacq. Vind. t. 143.
 — *verbascifolia*. Brownish-red. Brazil. B. R. t. 908.

Helinus. (From *helinos*, a branch ; on account of its spreading branches. Nat. ord., *Rhamnaceæ* ; Tribe, *Gouaniaceæ*.)

A climbing greenhouse shrub, suitable for training up rafters, etc. Seeds ; cuttings of the half-ripened shoots in sand, in a moderate heat and protected from the sun. Rich sandy loam ; requires plenty of pot room.

H. ova'tus. Greenish. Natal. 1862. Ref. Bot. t. 146. Syn., *Rhamnus mystacinus*.

Heliocarpus. (From *helios*, the sun, and *karpus*, a fruit ; in reference to the fringes on the cells, or carpels, of the fruit. Nat. ord., *Tiliaceæ* ; Tribe, *Grewiaceæ*. Allied to *Grewia* and *Triumfetta*.)

Stove evergreen shrub. Cuttings of half-ripened shoots in summer, in sand, under a bell-glass, and in heat ; sandy loam and fibry peat.

H. americana. 16. Purple. Vera Cruz. 1733. Jacq. H. Schœnh. t. 453.

Helio'neris. See *Gymnolomia*.

Helio'phila. (From *helios*, the sun, and *phileo*, to love ; referring to the sunny aspect where they delight to grow. Nat. ord., *Cruciferae* ; Tribe, *Sisymbriaceæ*.)

All from South Africa. Annuals, by seed in a warm, dry border, in April, or, better still, in a slight hotbed, under a glass, in March, and transplant in May. The under-shrubs require the greenhouse, or cold, dry pit, to winter them in, and are propagated by cuttings of young shoots in sandy soil, under a hand-glass.

GREENHOUSE EVERGREENS.

H. callosa. 1. Yellow. July. 1802. Syn., *H. cleomoides*.
— *linearifolia*. 1. Blue. June. 1819.
— *platysliqua*. See *H. succulenta*.
— *sca'ndens*. White, tinged rose. Natal. 1887. A climber
— *scopa'ria*. 1. Red. June. 1802.
— *succule'nta*. 1. Purple. July. 1774. Syn., *H. platysliqua*.

HARDY ANNUALS.

H. amplexica'lis. 2. White, purple. July. 1774.
— *arabio'ides*. B. M. t. 496. See *H. pilosa*, var. *incisa*.
— *coronopifolia*. 1½. Violet. July. 1778.
— *crithmifolia*. 1. Violet. July. 1816.
— *diffusa*. 2. White. June. 1818.
— *digitata*. See *H. pilosa*, var. *digitata*.

— *tri'pida*. 2. Purple. June. 1819.

Helio'psis. (From *helios*, the sun, and *opsis*, like ; the appearance of the flowers. Nat. ord., *Compositæ* ; Tribe, *Helianthoideæ*. Allied to *Zinnia*.)

Hardy herbaceous perennials, with yellow flowers. By seed and division ; common soil ; treatment similar to that for *Helianthus*.

H. canescens. 2. August. Peru. 1818. Syns., *H. rugosa* and *Helianthus buphthalmoides*.
— *la'vis*. 6. August. N. Amer. 1714. B. M. t. 3372.
— *grandifl'ora*. 6. Orange. August. N. Amer.
— *sca'bra*. 5. August. N. Amer. 1824. Syn., *H. canescens* of B. R. t. 592.

Heliotro'pium. Turnsole. (From *helios*, the sun, and *trope*, twining ; in reference to the curled or twining of the flower-branch. Nat. ord., *Boraginææ* ; Tribe, *Heliotropiææ*.)

Hardy annuals, sown in open border, in April ; tender annuals and biennials, in hotbed, and transplanted ; biennials to be kept on by cuttings ; shrubs, by cuttings at any time, but best in spring and autumn : at the first period give a little bottom-heat, at the latter period place them under glass, and shade ; rich, light soil.

STOVE ANNUALS AND BIENNIALS.

H. breviflorum. 1. White. Nepal. 1824. Biennial.
— *coromandelinum*. 1. White. E. Ind. 1812.
— *parviflorum*. 1. White. August. W. Ind. 1732. Biennial.

- *viduus*. 1. Purple. March. Corsica. 1710. B. M. t. 72.
- *integrifolius*. 1. Purple. February. Corsica. 1710.

- H. niger*. 1. Pink. Austria. 1596. Christmas rose. There are varieties—*altifolius*, *major* and *maximus*.
- *angustifolius*. 1. Pink. March. Austria. 1596.
- *odoratus*. 1. Green. March. Hungary. 1817. B. R. t. 1643.
- *olympicus*. 2. Green. February. Greece. 1840.
- *orientalis*. 1. Dark. February. Greece. 1839. There are several hybrids from this—*elegans*, *iridescens* and *punctatus*.
- *purpureascens*. 1. Purple, green. March. Hungary. 1817.
- *vernalis*. 3. White. March. Austria. 1596.
- *viridis*. 1. Bright green. Spring. Europe. Eng. Bot. ed. 3, t. 44.

Helle'nia. (Named after *C. N. Hellenius*, professor at Abo. Nat. ord., *Scitamineæ*; Tribe, *Zingibereæ*. Now united to *Alpinia*.)

Stove herbaceous perennials, with white flowers; division in spring; rich, sandy loam and a little peat. Treatment similar to *HEDYCHUM*.

- H. abnormis*. 10. June. China. 1824.
- *cærulea*. 4. N. Holland. 1820.
- *chinensis*. 3. China. 1825.

Helmet Flower. *Aconitum*, *Coryanthes*, and *Scutellaria*.

Helmho'tzia. (Dedicated to *Hermann Helmholtz*, a celebrated Professor of Ophthalmology. Nat. ord., *Phylodreæ*.)

Stove herbaceous perennial of tufted habit. Seeds, divisions. Sandy loam and peat, well drained; it requires plenty of water.

- H. glaberrima*. 3. White. Polynesia. 1873. Syn., *Phylodrum glaberrimum*. B. M. t. 6056.

Hel'mia. (In honour of *Dr. C. Helm*, Nat. ord., *Dioscoreaceæ*.)

Stove shrubby climber, with tuberous roots. For cultivation, see *DIOSCOREÆ*, to which it is united in the Genera Plantarum.

- H. racemosa*. Yellow, purple. Central America.

Helminthosta'chys. (From *helminthion*, a little worm, and *stachys*, a spike. Nat. ord., *Filices*—*Polypodiaceæ*.)

Stove fern. See *FERNES*.

- H. zeylanica*. Ceylon. 1861.

Helo'nias. (A diminutive of *helos*, a marsh; small marsh-plants. Nat. ord., *Liliaceæ*; Tribe, *Narthecieæ*. Allied to *Tofieldia*.)

Hardy herbaceous perennials, from North America. By seeds, and dividing the roots in spring; sandy, fibry loam and peat, and requiring a moist, somewhat shaded situation.

- H. angustifolia*. 1. White. May. 1823.
- *asphodelioides*. B. M. t. 748. See *Xerophyllum*.
- *bracteata*. B. M. t. 1703. See *Zygadenus bracteatus*.
- *bulbata*. B. M. t. 747. See *H. latifolia*.
- *erythrosperma*. 3. White. June. 1770. Syn., *H. laeta*.
- *glaberrima*. B. M. t. 1880. See *Zygadenus commutatus*.
- *graminea*. B. M. t. 1599. See *Xerophyllum gramineum*.

- H. læta*. B. M. t. 803 and 1540. See *Herythosperma*.
 — *latifolia*. 14. Purplish. Summer. 1758. Syn., *H. bullata*.
 — *lu'tea*. B. M. t. 1062, and *pu'mila*. Jacq. Ic. t. 453. Now referred to *Chamaetrium*.
 — *virginica*. B. M. t. 985. See *Zygadenus virginicus*.
 — *virides*. B. M. t. 1096. See *Veratrum viride*.

Helonio'psis. (From *Helonias*, and *opsis*, like. Nat. ord., *Liliaceæ*; Tribe, *Narthecieæ*.)

Hardy perennial. Treatment similar to *HE-LONIAS*.

- H. japonica*. Rose-colour. Japan. Syn., *H. umbellata*. G. C. 1887, i. p. 711.

Helwi'ngia. (After G. A. Helwing, a Prussian botanist. Nat. ord., *Araliaceæ*.)

A dwarf hardy shrub, more curious than beautiful.

- H. ruscifolia*. Flowers greenish, produced upon the midrib of the leaves. Japan.

Hemeroca'llis. Day Lily. (From *hemero*, a day, and *kallos*, beauty. Nat. ord., *Liliaceæ*; Tribe, *Hemerocallieæ*.)

Hardy herbaceous perennials. Division in spring; common garden-soil.

- H. alba*. Andr. Rep. t. 194. See *Funkia subcordata*.
 — *cærulea*. Andr. Rep. t. 6. See *Funkia ovata*.
 — *cordata*. See *Funkia subcordata*.

 — *japonica*. B. M. t. 1433. See *Funkia subcordata*.
 — *Middendorffii*. 2. Golden-yellow. Summer. N.E. Asia.
 — *minor*. 3. Yellow, tinged with green. Summer N. China and Japan. 1759. Syn., *H. graminea*.
 — *pecta*. 1868.
 — *plantaginea*. See *Funkia subcordata*.
 — *rutilans*. See *H. Dumortieri*.
 — *Sieboldii*. See *H. Dumortieri*.
 — *speciosa*. Yellow. July.
 — *Thunbergii*. 2. Orange. August. Japan.

Hemia'ndra. (From *hemi*, half, and *aner*, a man; in reference to the absence of the two upper stamens, being half the normal number. Nat. ord., *Labiatae*; Tribe, *Prostanthereæ*. Allied to *Prostanthera*.)

Greenhouse evergreen shrubs, from Australia. Cuttings of half-ripened shoots in sand, under a bell-glass, in April; loam and peat, lightened with sand and pieces of charcoal. Summer temp., 55° to 75°; winter, 38° to 45°.

- H. brevifolia*. See *H. pungens*, var. *diffusa*.
 — *emarginata*. See *H. pungens*, var. *hispida*.
 — *hirta*. See *H. pungens*, var. *diffusa*.
 — *pungens*. White, purple. May. Fl. Ser. t. 985.

- H. pungens diffusa*. May. King George's Sound. 1840. Syns., *H. brevifolia* and *hirta*.
 — *hispida*. May. W. Australia. 1887. Syns., *H. emarginata* and *rupestris*.
 — *rupestris*. See *H. pungens*, var. *hispida*.

Hemichæ'na. (From *hemi*, half, and *chairo*, to gape. Nat. ord., *Scrophulariaceæ*; Tribe, *Cheloneæ*. Allied to *Leucocarpus*.)

A handsome stove shrub, with mimulus-like flowers. Ripened cuttings in sandy loam, under a hand-glass and in bottom-heat. Loam and peat or leaf-mould.

- H. frutescens*. 5. Yellow. Central America. 1873. B. M. t. 6164.

Hemici'dia. (From *hemi*, half, and *kleio*, to shut; referring to the appearance of the flowers. Nat. ord., *Proteaceæ*; Tribe, *Banksieæ*.) See *Dryandra*.

- H. Baxteri*. B. M. t. 1455. See *Dryandra fallata*.

Hemidi'ctyon. (From *hemi*, half, and *diktyon*, a net. Nat. ord., *Filices*.) Now referred to *Asplenium*.

A stove fern. Division in spring; peat and loam.

- H. marginatum*. Brown. S. Amer.

Hemige'nia. (From *hemi*, half, and *gena*, to beget; referring to the absence of the two upper stamens, being half the normal number. Nat. ord., *Labiatae*; Tribe, *Prostanthereæ*. Allied to *Hemia'ndra*.)

Greenhouse evergreen shrub. Cuttings of short young shoots in sand, under a bell-glass; peat and loam. Requires good drainage.

- H. incana*. 2-3. Pink or purple. Swan River. Syn., *Atelandra incana*.
 — *purpurea*. Purple. April. N. S. Wales. 1824.

Hemigo'nium. (From *hemi*, half, and *gonu*, angle. Nat. ord., *Filices*.)

Herbaceous stove fern. Divisions in spring; peat and loam.

- H. caducum*. Brown, yellow. May. W. Ind.

Hemigra'phis. (From *hemi*, half, and *grapho*, to write. Nat. ord., *Acanthaceæ*; Tribe, *Ruellieæ*.)

Stove perennials. For culture, see *RUELLIA*.

- H. australis*. 1. Bright blue, throat reddish. Australia. Syn., *Ruellia australis*.
 — *colorata*. White. Leaves bright purple beneath. India. 1885.
 — *elegans*. 2. Blue, purple. August. E. Indies. 1834. Syn., *Ruellia elegans*. B. M. t. 3389.

Hemime'ris. (From *hemi*, half, and *meris*, a part; referring to the appearance of the flowers as if in two halves. Nat. ord., *Scrophulariaceæ*. Allied to *Alonsoa*.)

Stove herbaceous perennial. Cuttings of young shoots in sandy soil, and in bottom-heat; sandy loam and a little peat.

- H. coccinea*. A synonym of *Alonsoa incisæfolia*.
 — *urticifolia*. A synonym of *Alonsoa incisæfolia*.

Hemioni'tis. (From *hemionos*, a mule; supposed to be barren. Nat. ord., *Filices*.)

Stove herbaceous perennials. Dividing the roots; sandy loam and peat.

- *cordata*. Brown, yellow. July. E. Ind.
- *palma'ta*. $\frac{3}{4}$. July. W. Ind. 1793.
- *peda'ta*. $\frac{3}{4}$. Mexico. 1822.
- *pinna'ta*. Brown, yellow. July. E. Ind.

Hemio'rchis. (From *hemi*, half, and *orchis*; the inflorescence resembles that of some orchids. Nat. ord., *Scitamineæ*; Tribe, *Zingibereæ*.)

Stove or greenhouse herbaceous perennial. Seed. Sandy loam, peat.

- *burma'nica*. Purple, yellow. Himalayas and Burmah. B. M. t. 7120.

Hemiphra'gma. (From *hemi*, half, and *phragma*, a partition; in allusion to the partition in the capsule. Nat. ord., *Scrophulariaceæ*.)

A prostrate, half-hardy herb.

- *heterophyllum*. Pink. Summer. Himalayas.

Hemipi'lia. (From *hemi*, half, and *pilos*, a cap. Nat. ord., *Orchideæ*.)

Stove terrestrial orchid. See ORCHIDS.

- *calophylla*. White; lip rich purple. Tensas. 1887. B. M. t. 6920.

Hemiste'mma. (From *hemi*, half, and *stemma*, a crown; alluding to the stamens crowning one side of the flower. Nat. ord., *Dilleniaceæ*.) A synonym of **Hibbertia**.

Hemite'lia. (From *hemi*, half, and *mitella*, a mitre; shape of root-stock. Nat. ord., *Filices*.)

Stove ferns, except *H. capensis* and *Smithii*, requiring similar treatment to HEMIONITIS.

- *capensis*. 14. S. Africa, Brazil, and Java. Greenhouse.
- *grandifo'lia*. W. Indies. 1852.
- *guianensis para'dæ*. Columbia. 1877.
- *horrida*. 20. Brown, yellow. W. Indies. 1848.
- *Karstenia'na*. Venezuela.
- *multifo'ra*. Brown, yellow. W. Indies. 1824.
- *seto'sa*. Brazil.
- *Smithii*. New Zealand. Syn., *Cyathea Smithii*. Greenhouse.
- *specio'sa*. Tropical America.

Hemlock. *Coni'um*.

Hemlock Spruce. *Pi'nus cana-densis*.

Hemp Agrimony. *Eupato'rium cannabi'num*.

Hen-and-Chickens. *Bellis perennis*, var. *proli'fera*. See **Daisy**.

Henbane. *Hyoscy'amus*.

Henfreya. (Named after Arthur Henfrey, Esq., a distinguished botanist. Nat. ord., *Acanthaceæ*; Tribe, *Justiceæ*. Allied to *Crossandra*.) A synonym of **Asystasia**.

Stove evergreen twiner. Cuttings of small side-shoots in sand, under a bell-glass, in a brisk bottom-heat; turfy loam and fibry peat; keep a high moist temperature after shifting.

- *scandens*. White. May. Sierra Leone. 1845. B. R. 1847, t. 31. Now known as *Asystasia quaterna*.

Henke'lia. (After Friedrich Henkel, a botanical author of the eighteenth century. Nat. ord., *Gesneraceæ*; Tribe, *Cyrtandreeæ*.) United with **Didymocarpus**.

— *crini'ta*. A synonym of *Didymocarpus crinitus*.

Henna-plant. *Lawso'nia al'ba*.

Hepa'tica. (From *hepaticos*, relating to the liver; referring to the lobed leaves. Nat. ord., *Ranunculaceæ*; Tribe, *Anemoneæ*.) See **Anemone**.

- *acutifo'ba*. See *Anemone hepatica*, var. *acutifo'ba*.
- *america'na*. B. R. t. 387. See *Anemone hepatica*.
- *angulo'sa*. See *Anemone angulosa*.
- *trifo'ba*. See *Anemone hepatica*.

Hepi'alus Hu'muli. See **Otter Moth**.

Heptapleu'rum. (From *hepta*, seven, and *pleuron*, a rib; in allusion to the ribbed fruit. Nat. ord., *Araliaceæ*.)

Stove evergreen shrubs, requiring the same treatment as ARALIA.

- *polybo'tryum*. Green. Winter. Java. 1860. B. M. t. 6238. Syn., *Paratropia Teysmanniiana*.
- *venulo'sum*. Greenish. India. Syn., *Paratropia venulosa* and *Aralia digitata*.

Heraca'ntha. (From *heros*, a hero, and *acantha*, a thorn; alluding to the large thorns. Nat. ord., *Compositæ*; Tribe, *Cynaroideæ*.) See **Kentrophyllum**.

— *tauri'ca*. See *Kentrophyllum tauricum*.

Hera'cleum. Cow Parsnip. (From *heracles*, a plant consecrated to Hercules. Nat. ord., *Umbellifereæ*; Tribe, *Peucedaneæ*.)

Strong, coarse plants, adapted for rough ground, banks of lakes, rivers, and waterfalls. *H. villo'sum* is the best for these purposes. All the species are hardy biennials or herbaceous perennials, and white flowered.

- *absinthio'fitum*. 2-3. Caucasus.
- *emimens*. G. C. 1871, p. 375.
- *flavescens*. Austria. Jard. 1889, p. 155.
- *giga'ntium*. See *H. villo'sum*.
- *persicum*. 13. White. Persia. 1888.
- *seto'sum*. S. Europe.
- *sibi'ricum*. 6. Summer. Europe, Asia. 1789.
- *villo'sum*. 10-12. Caucasus. 1820. Syn., *H. giganteum*.

Herbaceous Plants are plants which produce stems annually from a perennial root.

Herbal. A title given by many old authors to books treating on plants.

Herbarium. A collection of dried plants.

Herbary was a department of the garden formerly much more cultivated than at present, when the more potent medicinal plants of hotter climates are so easily procurable. The following is a list of the tenants of the herbary, the appropriate cultivation of which will be found under their particular titles:— Angelica, Balm, Basil, Blessed Thistle, Borage, Burnet, Caraway, Chamomile, Chervil, Coriander, Dill, Hyssop, Lavender, Liquorice, Marigold, Marjoram, Mint, Pennyroyal, Peppermint, Purslane, Rue, Sage, Savory, Scurvy Grass, Tansy, Tarragon, Thyme, Wormwood.

Herbertia. (Named after *Dr. Herbert*, Dean of Manchester, a distinguished investigator of bulbous plants. Nat. ord., *Iridac.* This name, published in 1838, has been superseded in the Genera Plantarum by **Alophia**, published in 1840. **Herbertia** should therefore be retained.)

Pretty little half-hardy bulbs. Seeds and offsets in spring; sandy loam and a little peat; should be kept in a cold pit in winter, or protected in a dry border.

- H. cœrulea.* Blue. April. Texas. 1842. B. M. t. 3862, fig. 3.
 — *Drummondiana.* Violet. April. Texas. 1842.
 — *pulchella.* 3. Blue, purple. July. Chili. 1827.
 — *pustilla.* Yellow. June. Brazil. 1830. B. M. t. 3862, figs. 1 and 2.

Herb-bennet. *Ge'um.*

Herb-grace. See Rue.

Herb Paris. *Pa'ris.*

Herb Robert. *Gera'nium Robertia-num.*

Hercules' Club. *Zanthoxyllum clava Herculis.*

Heritie'ra. Looking-glass plant. (Named after *L'Heritier*, a French botanist. Nat. ord., *Sterculiaceæ*; Tribe, *Sterculiæ.* Allied to *Sterculia.*)

- Stove evergreen trees; cuttings of ripe young shoots in sand, under a glass, and in brisk bottom-heat; sandy, rich loam and a little peat.
H. littoralis. 20. Red. Leaves silvery beneath. E. Ind. 1780. Syn., *H. minor.*
 — *macrophylla.* Whitish. Leaves larger than in *H. littoralis.* India. G. C. 1886, xxv., p. 81.
 — *minor.* See *H. littoralis.*

Herma'nnia. (Named after *Paul Hermann*, a botanist. Nat. ord., *Sterculiaceæ*; Tribe, *Hermanniceæ.* Allied to *Mahernia.*)

Greenhouse evergreen shrubs, from South Africa, with yellow flowers, except where otherwise mentioned. Cuttings of young shoots in

sandy soil, in spring, under a glass; sandy loam and a little fibry peat.

- H. alnifolia.* 7. March. 1728.
 — *althæifolia.* 2½. April. 1728. B. M. t. 307. Syn., *H. fragrans.*
 — *argentea.* 2. Orange. May. 1820.
 — *conglomerata.* Yellow. S. Africa. 1872. Ref. Bot. t. 217.
 — *coronopifolia.* 2. June. 1828.
 — *cristata.* Orange-red. Transvaal. B. M. t. 7173.
 — *cuneifolia.* 2. August. 1791.
 — *decumbens.* 1. May. 1821.
 — *disermæfolia.* April. 1794. Jacq. H. Schoenb. t. 121.
 — *fasciculata.* Claret-purple. S. Africa. 1869. Ref. Bot. t. 289.
 — *flammea.* 3. Orange. December. 1794.
 — *fragrans.* See *H. althæifolia.*
 — *glandulosa.* 2. June. 1822.
 — *grandiflora.* See *Mahernia grandiflora.*
 — *hirsuta.* 3. April. 1789. Syn., *H. scabra.*
 — *hispidula.* March. 1824.
 — *holosericea.* 2. June. 1792.
 — *hyssopifolia.* 7. Straw. May. 1725.
 — *incisa.* 2. June. 1816.
 — *inflata.* 3. Tawny. September. S. Amer. 1829.
 — *involuta.* See *H. salviafolia.*
 — *latifolia.* Jacq. H. Schoenb. t. 119. See *H. salviafolia.*
 — *lavandulæfolia.* 1½. June. 1732.
 — *micans.* 2. 1790.
 — *multiflora.* 3. April. 1791.
 — *odora.* 3. May. 1780.
 — *plicata.* 3. November. 1774.
 — *procermbens.* 1½. May. 1792.
 — *pulverulenta.* 2. June. 1820.
 — *salviafolia.* 2. May. 1794. Syns., *H. involucreta* and *latifolia.*
 — *scabra.* Jacq. H. Schoenb. t. 127. See *H. hirsuta.*
 — *scoparia.* Cream-coloured. S. Africa. 1870. Ref. Bot. t. 195.
 — *tenuifolia.* 2. June.
 — *trifolia.* 2. 1752.
 — *trifurcata.* 3. Purple. May. 1789.
 — *triphylla.* 2. June. 1819.

Hermaphrodite. Flowers containing both male and female organs.

Herminie'ra. Ambash or Pith Tree. (From *hermine*, a bed-post; in reference to the shape of the stem. Nat. ord., *Leguminosæ.*)

Stove shrub, requiring a damp situation. The pot should be partially submerged. Seeds.

- H. Elaphroxyton.* Yellow. Tropical Africa.

Hermi'nium. (Derivation not explained. Nat. ord., *Orchidææ*; Tribe, *Ophrydeæ*—*Habenariææ.* Allied to *Ophrys.* Syn., *Aoplia.*)

Terrestrial orchids, inhabiting dry, chalky banks. Divisions of the roots; chalky loam and fibry peat; some hardy enough for a shady border, and others requiring the greenhouse.

- H. alpinum.* White. May. Switzerland. 1824.
 — *cordatum.* 3. Yellowish-green. March. N.W. Africa. 1830.
 — *congestum.* Green. November. Madeira.
 — *monorchis.* Green. June. England. Eng. Bot. ed. 3, t. 1701.

Herna'ndia. Jack-in-a-box. (Named after *F. Hernandez, M.D.*, a Spanish botanist. Nat. ord., *Laurineæ*;

Tribe, *Hernandiææ*. Allied to *Inocarpus*.)

Stove evergreen trees. Cuttings of ripe shoots in sand, under a bell-glass, and in brisk bottom-heat; peat and loam.

H. guianensis. 50. Guiana. 1820.

— *Mærenhoutiana*. Yellowish. Friendly Islands. 1809.

— *ovigera*. 50. E. Ind.

— *sonora*. 50. E. Ind. 1693. Wight Ic. t. 1855.

Herniaria. (From *hernia*, a rupture; from a supposition that this plant is a cure for ruptures. Nat. ord., *Illecebraceæ*.)

Hardy herbaceous plants, of little use, except for carpet bedding.

H. glabra. $\frac{1}{2}$. Green. Europe. Eng. Bot. ed. 3. 1171.

Heron's Bill. *Erodium*.

Herpestes. (From *herpestes*, a creeping thing; in reference to the creeping stems. Nat. ord., *Scrophulariaceæ*; Tribe, *Gratiolææ*. Allied to *Gratiola*.)

Aquatic perennials. Seeds and divisions; rich, loamy soil. *H. cuneifolia* is hardy; the other two require pans or tubs of water in a greenhouse.

H. cuneifolia. See *H. Monnieria*.

— *Monnieria*. $\frac{1}{2}$. Light blue. August. S. Amer. 1772. B. M. t. 2557. Syn., *H. cuneifolia*.

— *polyantha*. See *H. stricta*.

— *reflexa*. See *Myriophyllum proserpinacoides*.

— *stricta*. 1. Blue. August. Brazil and W. Indies. 1824. Syn., *H. polyantha*.

Herrænea. (Named after *General Herran*, a President of the Republic of New Grenada. Nat. ord., *Sterculiaceæ*; Tribe, *Buettneriææ*.)

Stove evergreen tree. For cultivation, see *THEOBROMA*, to which it is allied.

H. palmaria. Australia. 1866.

Herre'ria. (In honour of *Gabriel de Herrera*, a Spanish agriculturist of the fifteenth century. Nat. ord., *Liliacææ*.)

Greenhouse climber. A mixture of peat, sand, and loam. Seeds or cuttings.

H. Sarsaparilla. 8. Green, yellow. June. Brazil. 1824. Syn., *H. parviflora*. B. R. t. 1042.

Hesperaloe. (To indicate its affinity with *Aloe*. Nat. ord., *Liliacææ*; Tribe, *Dracæneæ*.)

Half-hardy succulent plant, with the habit of a dwarf *aloe*.

H. yuccæfolia. 3-4. Pale rose. Texas. 1882. G. C. 1882, xviii. p. 199, fig. 34. Syns., *Aloe yuccæiflora* and *Yucca parviflora*.

Hesperantha. Evening Flower. (From *hesperos*, the evening, and *anthos*, a flower. Nat. ord., *Iridææ*; Tribe, *Ixiææ*. Allied to *Ixia*.)

Small bulbs, from the Cape of Good Hope. Offsets; sandy loam and peat; requiring the protection of a cold pit in winter.

H. angustata. $\frac{1}{2}$. White. May. 1825.

H. cinnamo'mea. $\frac{1}{2}$. Violet. April. 1787. B. M. t. 1054.

— *erecta*. Yellow, blue. May. 1825. Syn., *Geissorhiza erecta*.

— *falcata*. $\frac{1}{2}$. Violet. May. 1787. Syn., *Ixia falcata*. B. M. t. 566.

— *graminifolia*. $\frac{1}{2}$. Greenish-white. August. 1808. Syn., *H. pilosa*, var. *nuda*. B. M. t. 1254.

— *longituba*. 1. White, reddish-brown. S. Africa. 1877.

— *pilosa*. $\frac{1}{2}$. White, speckled with red outside. April. 1811. B. M. t. 1475.

— *nuda*. See *H. graminifolia*.

— *radiata*. $\frac{1}{2}$. Violet. May. 1794. Syn., *Ixia radiata*. B. M. t. 573.

He'speris. Rocket. (From *hesperos*, the evening star; rockets being sweeter towards the evening. Nat. ord., *Cruciferaæ*; Tribe, *Sisymbriææ*.)

Annuals and biennials sow in open border; in March and April; perennials, division of the root, and giving them fresh soil; the best time for this is after they have finished flowering and fresh growth has commenced; light, rich soil.

HARDY ANNUALS.

H. pulchella. 1. Red. July. Levant. 1827.

— *pygmaea*. Purple. June. Syria. 1828.

— *ramosissima*. $\frac{1}{2}$. Red. July. Algiers. 1819.

HARDY BIENNIALS.

H. bituminosa. See *H. runcinata*, var. *bituminosa*.

— *elata*. 4. Pink. June. Europe. 1824.

— *fragrans*. 1. Purple. May. Siberia. 1821.

— *grandiflora*. 4. White, purple. July. 1820. B. M. t. 2683.

— *heterophylla*. 4. Red. May. Italy. 1823.

— *laciniosa*. 1. $\frac{1}{2}$. Purple. May. South France. 1816.

— *runcinata*. 1. $\frac{1}{2}$. White, purple. June. Hungary. 1804.

— *bituminosa*. 1. $\frac{1}{2}$. White, purple. June. Syn., *H. bituminosa*.

— *tristis*. 1. Purple. May. Austria. 1629. B. M. t. 730.

HARDY HERBACEOUS PERENNIALS.

H. aprica. $\frac{1}{2}$. Purple. May. Siberia. 1822.

— *excelsa*. 3. White. May. 1828.

— *nodosa*. See *H. matronalis*, var. *sylvestris*.

— *matronalis*. 4. Purple. June. Europe. 1597. Eng. Bot. ed. 3, t. 105.

— *albiflora*. 4. White. June. Europe. 1759.

— *albo-plena*. 2. White. June. Europe. 1597.

— *foliiflora*. 2. Green. June. Europe. 1597.

— *hortensis*. Purple. June. Europe. 1759.

— *purpureo-plena*. Red. June. Europe. 1597.

— *sibirica*. 3. Purple. June. Siberia. 1800. Syn., *H. sibirica*.

— *sylvestris*. Pink. June. Britain. Syn., *H. nodosa*.

— *variegata*. 2. White, red. June. Europe. 1597.

— *repanda*. 2. Purple. June. Spain. 1821.

— *sibirica*. See *H. matronalis*, var. *sibirica*.

— *speciosa*. $\frac{1}{2}$. Rose, purple. April. Siberia. 1829. Swt. Fl. Gard. ser. 2, t. 135.

— *violacea*. $\frac{1}{2}$. Deep violet. June. Asia Minor.

EXCLUDED SPECIES.

H. africana. See *Malcomia africana*.

— *arenaria*. See *Malcomia arenaria*.

— *litorea*. See *Malcomia littorea*.

— *verna*. See *Arabis verna*.

Hesperocallis. (A name "to

suggest affinity with *Hemerocallis*." Nat. ord., *Liliaceæ*; Tribe, *Dracæneæ*.)

H. undulata. 2. Whitish. Sweet-scented. California. 1882.

Hespero'chiron. (Derivation not stated. Nat. ord., *Solanaceæ*.)

Half-hardy annual. Seeds.

H. californica. 3. White, with black stripes. July. California. 1823. Syn., *Nicotiana nana*. B. R. t. 833.

— *puberulus*. White, violet, yellow. N. Amer. 1888.

Hesperosco'rduum. (The onion of the west; from *hesperos*, the evening, and *scordon*, garlic. Nat. ord., *Liliaceæ*; Tribe, *Alliææ*.) United to **Brodiaea**.

Seeds or offsets in spring; sandy loam; require a little protection in winter.

H. hyacinthinum. 1. Blue. July. 1826.

— *lacteum*. See *Brodiaea lactea*.

He'ssia. (After *Paul Hesse*, a botanical traveller. Nat. ord., *Amaryllidææ*; Tribe, *Amaryllææ*. Syn., *Imhofia*.)

H. erispata. 3. Pink. Summer. Cape Colony. 1790. Syns., *Amaryllis crispa*, Jacq. H. Schoenb. t. 72, *Imhofia crispa*, and *Strumaria crispa*, B. R. t. 1383.

— *filifolia*. 3. White. November. Cape Colony. 1774. Syns., *Imhofia filifolia* and *Strumaria filifolia*, Jacq. Ic. t. 361.

— *gemmata*. 1. Pale yellow. October. Cape Colony. 1812. Syns., *Imhofia Burchelliana*, *I. gemmata*, and *Strumaria gemmata*, B. M. t. 1620.

— *stellaris*. 3. Pink. October. Cape Colony. 1794. Syns., *Amaryllis stellaris*, Jacq. Ic. t. 71, and *Strumaria stellaris*.

Hessian Fly. *Cecido'myia destruc'tor*.

Hetera'nthera. (From *heteros*, variable, and *anther*, anther. Nat. ord., *Pontederaceæ*.)

Water perennials, allied to *Eichornia*. *H. limosa* will thrive in a pond or stream; the others require tubs in the greenhouse and stove; division; rich loam.

H. acuta. White. June. Virginia. 1812.

— *limosa*. Blue. July. N. Amer. 1822. B. M. t. 6192.

— *reniformis*. Blue. July. S. Amer. 1824.

Heteroce'ntron. (From *heteros*, variable, and *centron*, a spur. Nat. ord., *Melastomaceæ*; Tribe, *Osbeckiææ*.) See **Heeria**.

H. mexicana. B. M. t. 5166, and *H. roseum*, Ill. Hort. t. 97. See *Heeria rosea*.

Heterochæ'ta. (From *heteros*, variable, and *chaite*, a bristle; referring to the flower-envelopes. Nat. ord., *Compositææ*; Tribe, *Asteroidææ*.) Referred to **Aster** and **Erigeron**.

H. pubescens. See *Erigeron pubescens*.

Heteromorphæa. (From *heteros*, variable, and *morpha*, form; referring to the leaves. Nat. ord., *Umbelliferaæ*; Tribe, *Ammineææ*.)

Greenhouse evergreen shrub. Cuttings of young shoots under a bell-glass, in sand; sandy loam.

H. arboreo'scens. 2. Yellow. August. Cape of Good Hope. 1810.

Hetero'noma. (From *heteros*, variable, and *nome*, distribution; referring to the leaves. Nat. ord., *Melastomaceææ*; Tribe, *Osbeckiææ*.) A synonym of **Arthrostemma**.

H. diversifolium. See *Arthrostemma fragile*.
— *subtripline'roium*. See *Heeria subtripplinervia*.

Heteropa'ppus. (From *heteros*, dissimilar, and *pappus*, down; on account of the pappus of the ray and disc florets being different. Nat. ord., *Compositææ*; Tribe, *Asteroidææ*.)

Hardy perennial Aster-like herb. For cultivation, see **ASTER**, to which it is allied.

H. decipiens. Purple. Amur River. 1864. Gf. t. 425.

Hetero'pterys. (From *heteros*, various, and *pteron*, a wing; referring to the wings of the seed-vessels being of different forms. Nat. ord., *Malpighiæææ*; Tribe, *Banisteriæææ*. Allied to *Banisteria*.)

Stove climbers, except *nitida*, which is a shrub. Cutting of firm young shoots in silver sand, over sandy peat, and plunged in bottom-heat, in April; sandy peat and loam, with pieces of charcoal, and thorough drainage. Summer temp., 60° to 85°; winter, 50° to 55°.

H. coerulesca. 10. Blue. W. Ind. 1823.

— *chrysophylla*. Orange. Brazil. 1793. B. M. t. 3237.

— *floribunda*. Blue. Mexico. 1824.

— *glabra*. Yellow. S. America.

— *laurifolia*. 10. Yellow. Jamaica. 1793.

— *nitida*. 10. Yellow. Brazil. 1809.

— *platyptera*. 10. Purple, yellow. July. Cayenne. 1823. Syn., *Byrsonima reticulata*.

— *purpurea*. Purple. Tropical America. 1759.

— *sericea*. 6. Yellow. July. Brazil. 1810.

— *undulata*. July. Buenos Ayres. 1838.

Heterospa'the. (From *heteros*, variable, and *spathe*, a spathe. Nat. ord., *Palmæææ*; Tribe, *Arecaææ*.)

Stove palm. Imported seeds. Rich sandy loam and leaf-mould. Summer temp., 65° to 85°; winter, 60° to 65°.

H. elata. Java. 1880. Syn., *Metroxylon elatum*.

Heterospe'rmum. (From *heteros*, variable, and *sperma*, seeds. Nat. ord., *Compositæææ*; Tribe, *Helianthoidæææ*.)

Hardy annual. Sow in the open border in April, or in a slight hotbed in March; seedlings to be transplanted.

H. pinatum. 2. Yellow. August. New Spain. 1799.

Hetero'stalis. See **Typhonium**.

Heterota'xis. (From *heteros*, variable, and *taxis*, arrangement. Nat. ord., *Orchideæææ*; Tribe, *Vandæææ-Maxillariæææ*.) See **Maxillaria**.

H. crassifolia. B. R. t. 1028. See *Maxillaria crassifolia*.

Heterothe'ca. (From *heteros*, various, and *theca*, a covering; referring to the flower-envelopes. Nat. ord., *Compositæ*; Tribe, *Asteroideæ*.)

Hardy herbaceous perennials. Seeds and divisions of the plant in spring; common garden-soil.

H. inuloides. 1. Yellow. June. Mexico. 1826. Syn., *Diplocoma villosa*. Swt. Fl. Gard., t. 246.

— *scabra*. Yellow. August. Carolina and Georgia.

Hetero'toma. (From *heteros*, variable, and *toma*, a cut; in allusion to the unequally cut corolla. Nat. ord., *Lobeliaceæ*.)

Greenhouse herbaceous plant, with handsome spurred flowers, which bear a remarkable resemblance to a bird. Seeds in a slight hotbed, Rich loam and fibrous peat. Summer temp., 60° to 80°; winter, 55° to 65°.

H. lobelioides. Crimson. Mexico. 1861. G. C. 1887, p. 101. Fl. Ser. t. 1454.

Hetero'trichum. (From *heteros*, various, and *trich*, hair; referring to the disposition of the hairs on the leaves, etc. Nat. ord., *Melastomaceæ*; Tribe, *Miconiææ*. Allied to *Miconia*.)

Stove evergreen shrubs. Cuttings of young shoots in sandy peat, under a bell-glass, and in bottom-heat, in spring; sandy peat and fibry loam. Summer temp., 60° to 80°; winter, 48° to 55°.

H. macrodon. 7. White. September. S. Amer. 1848. B. M. t. 4421.

— *nitens*. White. May. St. Domingo. 1820.

— *patens*. Blush. May. St. Domingo. 1825.

Heuche'ra. (Named after Professor Heucher, a German botanist. Nat. ord., *Saxifragaceæ*; Tribe, *Saxifrageæ*.)

Hardy herbaceous perennials; divisions of the plant any time in spring; common garden-soil.

H. americana. 1. Purple. May. N. Amer. 1856.

— *cylindracea*. 2. Green. May. N. Amer. 1830. B. R. t. 1924. Sometimes called

H. cylindrica.

— *glabra*. 1. Pink. May. N. Amer. 1827.

— *hispidula*. 3. Purple. May. Virginia. 1826.

— *Menziesii*. See *Tolmiea Menziesii*.

— *pubescens*. 1. Pink, violet. June. N. Amer. 1812.

— *Richardsonii*. 1. Green. N. Amer. 1827.

— *sanguinea*. 1-1½. Bright crimson. June. New Mexico and Arizona. 1885. B. M. t. 6929.

— *villosa*. ¾. Violet. May. Canada. 1812.

He'via. (From *Hevé*, the vernacular name. Nat. ord., *Euphorbiaceæ*. Syns., *Micrandra* and *Siphonia*.)

Stove trees. Cuttings of half-ripened wood, in sand, under a bell-glass, in heat.

H. brasiliensis. 60. Green, white. May. Tropical S. America. 1823. Para Rubber tree.

Hewa'rdia. (Named after Mr. Howard. Nat. ord., *Filices*.) Synonymous with **Adiantum**.

A stove fern; divisions in spring; peat and sandy loam.

H. adiantoides. Brown. June. Guiana.

Hewi'ttia. (After Mr. Hewitt. Nat. ord., *Convolvulaceæ*.)

Stove climber. For cultivation, see *CONVOLVULUS*.

H. bicolor. White, purple. Guinea. Syn., *Convolvulus involucreatus*. B. R. t. 318.

Hexace'ntris. (From *hex*, six, and *centron*, a spur; alluding to two of its stamens having one spur each, and two of them two spurs each. Nat. ord., *Acanthaceæ*; Tribe, *Thunbergiææ*.) See **Thunbergia**.

H. mysorensis. B. M. t. 4786, and var. *lutea*. Fl. Ser. t. 942. See *Thunbergia mysorensis*.

Hexade'smia. (From *hex*, six, and *desmos*, a bond or thong; in allusion to the six pollen masses. Nat. ord., *Orchideæ*; Tribe, *Epidendraceæ-Stenoglosseæ*.)

Stove epiphyte. Should have similar treatment to *MASDEVALLIA*.

H. crurigeræ. ¾. White. Central America. 1869.

— *Reedii*. Yellowish-green. Brazil. 1868.

Hexaglo'ttis. (From *hex*, six, and *glotta*, a tongue; in reference to the six spreading lobes of the style. Nat. ord., *Iridææ*; Tribe, *Moreææ*. Allied to *Homeria*.)

Greenhouse bulbs. For cultivation, see *IXIA*.

H. longifolia. 1½. Yellow. May. S. Africa. 1766. Syns., *Homeria flexuosa*, *Ixia longifolia*, Jacq. H. Vind. iii. t. 90, and

Moreææ flexuosa. B. M. t. 695.

— *virgata*. 2. Yellow. May. 1825. Syn., *Moreææ virgata*. Jacq. Ic. t. 228.

Hexi'sea. (From *ezisoein*, to equalize; the lip is similar to the petals. Nat. ord., *Orchideæ*; Tribe, *Epidendraceæ-Stenoglosseæ*.)

A pretty stove epiphytal orchid. Culture same as *ORNITHIDIUM*.

H. bidentata. Bright scarlet. Panama and Columbia. 1837. B. M. t. 7031.

Hey'nea. (Named after Dr. Heyne, a German botanist. Nat. ord., *Meliaceæ*; Tribe, *Trichiliææ*. Allied to *Trichilia*.)

Stove evergreen, white-flowered trees. Cuttings of well-ripened young shoots in sand, under a bell-glass, in bottom-heat; sandy, rich loam and a little peat.

H. quinquejuga. 20. Java. 1816.

— *trijuga*. 20. September. Nepaul. 1812. B. M. t. 1738.

Hibbe'rtia. (Named by G. Hibbert, a distinguished promoter of botany. Nat. ord., *Dilleniaceæ*; Tribe, *Hibbertiææ*. Allied to *Candollea*. Syn., *Hemistemma*.)

Greenhouse evergreen shrubs, with yellow flowers, from Australia, except where otherwise mentioned. Cuttings of half-ripened roots in sandy soil, under a bell-glass, in spring; sandy loam and a little peat. *Vouabilla* is an elegant twiner, and *grossulariaefolia* makes either a creeper or a trailer; it has a fine effect suspended from a basket; does beautifully for

hanging down the sides of a rock-work in summer.

Hibi'scus. (Virgil's name for the Marsh Mallow. Nat. ord., *Malvaceæ*; Tribe, *Hibiscææ*.)

Hardy annuals sow in open border, in the beginning of April; tender annuals sow in hot-bed—seedlings to have out-door or greenhouse treatment; hardy herbaceous require dividing in spring, and a warm situation to grow in; hardy shrubs require an open situation fully exposed to the sun, by seeds, and double ones by layers, by cuttings of ripe shoots under a hand-light, in autumn, and kept on all the winter, and also by grafting. Greenhouse and stove species are propagated by young shoots in sandy soil, under a bell-glass, the stove kinds requiring bottom-heat, peat and loam; usual greenhouse and stove temperatures.

- Hickory.** *Carya.*
- Hide-bound.** See **Bark-bound.**
- Hieracium.** Hawkweed. (A name from Pliny for eye-salve; referring to the ancient employment of the juice. Nat. ord., *Compositae*; Tribe, *Cichoraceae*.)
- Hardy herbaceous perennials, with one ex-
- ception, and yellow-flowered, except where otherwise mentioned. The dwarf ones fitted for the front of borders, rock-works, and alpine grounds. Seeds and divisions of the plant in spring; light, rich loam. *Fruticosum* is a greenhouse shrub; cuttings will strike in sandy soil, either under a bell glass or a hand-light, during the summer; sandy loam suits it, with a little peat. It is a very large genus, only a very few species being suitable for garden plants.

Hiero'chloe. Holy Grass. (From *hieros*, sacred, and *chloa*, grass; on account of its being strewn before church doors, on saints' days, in some parts of North Europe. Nat. ord., *Gramineæ*.)

Hardy perennial sweet-scented grasses, suitable for mixed borders, etc.

- H. alpina*. 1. July. Mountains of northern hemisphere. 1827.
 — *borealis*. 1-2. Chestnut-brown. May. Caithness.
 — *redolens*. New Zealand. 1832.

Higgin'sia. (Named after Don O'Higgins, a Spanish-American officer. Nat. ord., *Rubiaceæ*; Tribe, *Hamelieæ*.) See **Hoffmannia**.

H. mexicana. See *Hoffmannia mexicana*.

Hillia. (Named after Sir John Hill, a botanical author. Nat. ord., *Rubiaceæ*; Tribe, *Cinchoneæ*. Allied to *Cinchona*.)

Stove evergreens, with white flowers. Cuttings in sand, under a glass, in bottom-heat; sandy loam and peat.

- H. longiflora*. 1½. March. W. Ind. 1789. B. M. t. 721.
 — *prasinantha*. Greenish. W. Ind. 1824. Fl. Ser. t. 188. Syn., *Solandra oppositifolia*.
 — *tetrandra*. 1½. June. Jamaica. 1793.

Hillebrandia. (After W. Hillebrand, a botanical collector. Nat. ord., *Begoniaceæ*.)

Stove herb, with the appearance of a Begonia, which see for culture.

- H. sandwicensis*. White. Sandwich Islands. 1887. B. M. t. 6953.

Hindsia. (Named after R. B. Hinds, a promoter of botany. Nat. ord., *Rubiaceæ*; Tribe, *Cinchoneæ*. Allied to *Manettia*.)

Greenhouse evergreen shrubs, from Brazil. Cuttings of young shoots in sand, under a bell-

glass, in bottom-heat. Sandy loam and leaf-soil.

- H. longiflora*. 2. Blue. August. 1841. Syn., *Rondeletia longiflora*, B. M. t. 3977.
 — *alba*. 2. White. May. 1845.
 — *violacea*. 3. Violet. May. 1844. B. R. 1844, t. 40.

Hippeastrum. Equestrian Star. (From *hippeus*, a knight, and *astron*, a star; referring to one of the species, *equestre*. Nat. ord., *Amaryllideæ*; Tribe, *Amaryllieæ*. Allied to *Vallota*.)

This genus of bulbs has no affinity with *Amaryllis*, with which the species are often confounded. Offsets; sandy loam, peat, and leaf-mould. Temp., 60° to 80° when growing; 40° to 50° when at rest.

STOVE.

- H. Ackermannii* and its var. *pulcherrima*, are garden hybrids.
 — *advenum*. 1-1. Yellow or red. December. Chili. Syns., *Amaryllis advena*, B. R. t. 849, *Habranthus hesperius*, *H. minutus*, Swt. Fl. Gard. ser. 2, t. 213, and *Eustephia Macleania* of Ref. Bot. t. 332.
 — *pallida*. Pale yellow. B. C. t. 1760.
 — *Alberti*. Orange-scarlet. Cuba. 1867.
 — *ambiguum*. B. M. t. 3542. Hybrid between *H. vittatum* and *H. solandriiflorum*.
 — *Andraeum*. 1. Red. Columbia. 1880.
 — *angustum*. B. M. t. 2639. See *H. bifidum*.
 — *anomalum*. Crimson, green. S. Amer.
 — *auriculatum*. 1½. Green, crimson. May. Central Brazil. 1819. Syn., *Amaryllis aulica*, B. M. t. 3311.
 — *glaucophyllum*. B. M. t. 2983. See *H. organense*.
 — *stenopetalum*. Perianth segments narrower than in the type. B. R. t. 444.
 — *Bagnoldii*. 1. Yellow, tinged with red. Chili. Syn., *Habranthus Bagnoldii*. B. R. t. 1396.
 — *barbatum*. White. A form of *H. equestre*.
 — *bicolor*. 1-1½. Bright red, yellowish-green. October. Chili. Syns., *Amaryllis bicolor*, *A. cyrtanthoides* B. M. t. 2399, *A. ignea*, B. R. t. 89, and *Phycella bicolor*, B. R. t. 1943.
 — *bifidum*. 1. Bright red. March. Buenos Ayres. 1825. Syn., *Habranthus bifidus*, B. M. t. 2599. Probably also *Habranthus kermesinus*, B. R. t. 1638, *H. intermedius*, B. R. t. 1148, *H. angustum*, B. M. t. 2639, *H. nobilis*, *H. nemoralis*, *H. pedunculatus*, *H. pulcher*, and *H. spathaceus*.
 — *brachyandrum*. Pale pink to blackish-red. S. Brazil. 1890.
 — *breviflorum*. 3. White, red. April. Buenos Ayres. 1836. B. M. t. 3549.
 — *bulbosum* and its numerous varieties are forms of *H. rutitum*.
 — *calyptratum*. 1½. Green, red. June. Brazil. 1816. Syn., *Amaryllis calyptrata*, B. R. t. 164.
 — *Carnarvonia*. Garden hybrid.

- H. Chelso'ni*. Fl. Mag. t. 545. Garden hybrid.
 — *Colvi'let*. Garden hybrid.
 — *Crod'mis*. Garden hybrid.
 — *Cybi'ster*. 2. Bright crimson, tinged with green. Andes of Bolivia. 1840. Syn., *Sprekelia Cybister*, B. R. 1840, t. 33.
 — *equestre*. 1½-2. Yellowish-green, bright red. August. Tropical America. 1710. Syn., *Amaryllis equestris*, B. M. t. 305.
 — — *ma'jor*. 2. Orange, green. W. Indies. 1710. B. R. t. 234.
 — — *semiple'num*. 2. Orange, green. August. Cuba. 1809.
 — *equestri'forme*. See *H. rutilum*, var. *fulgidum*.
 — *formosum*. Garden hybrid.
 — *Gowe'ni*. Garden hybrid.
 — *Gravi'næ*. Garden hybrid.
 — *Griffi'ni*. R. M. t. 3528. Hybrid between *H. psittactum* and *H. Johnsoni*.
 — *Haylo'ckii*. Garden hybrid.
 — *Henderso'ni*. Garden hybrid.
 — *Herberti*. Garden hybrid.
 — *Herberti'num*. 1. Bright red. Chili. 1825. Syn., *Phycella Herbertiana*, B. R. t. 1341.
 — *interme'dium*. 2. Striped. August. Brazil. 1821.
 — *Johnso'ni*. Garden hybrid.
 — *kermesi'num*. Carmine. June. Brazil. 1833.
 — *Leopo'dii*. Crimson, white, greenish. Peru. 1869. Flor. Mag. t. 475-6. Syn., *Amaryllis Leopoldii*.
 — *margina'tum*. Garden hybrid.
 — *Mende'zii*. Fl. Mag. new ser. t. 167. Garden hybrid.
 — *minia'tum*. 1-1½. Bright red. June. Peru. 1825.
 — *organe'nse*. 1-1½. Bright crimson, green. S. Brazil. 1841. Syn., *Amaryllis aulica*, var. *glauco'phylla*, B. M. t. 2983.
 — — *compre'ssum*. Red, white. Brazil.
 — *pard'i'num*. 2. Straw with scarlet spots. February. Peru. 1867. Flor. Mag. t. 344. Syn., *Amaryllis pardina*, B. M. t. 5645.
 — — *rube'scens*. Reddish. 1870.
 — *prate'nse*. 1-1½. Bright red. Chili. 1840. Syn., *Habranthus pratensis*, B. R. 1842, t. 85, and *H. speciosus*.
 — *pro'cerum*. 2-3. Lilac. Winter. S. Brazil. 1864. Syn., *Amaryllis procera*, Fl. Ser. t. 2077-8, and *A. Rayneri*, B. M. t. 5883.
 — *psittac'i'num*. 2. Green, scarlet. July. Brazil. 1816.
 — *pulverule'ntum*. B. M. t. 2273. See *H. rutilum*, var. *acuminatum*.
 — *pyrochro'um*. Scarlet. Brazil. 1865. Ill. Hort. t. 420.
 — *Regi'næ*. 2. Bright red, greenish-white. May. Tropical America. 1725. Mexican Lily. Syn., *H. regium* and *Amaryllis Regina*, B. M. t. 453.
 — *reticula'tum*. 1. Scarlet. April. S. Brazil. 1777. Syn., *Amaryllis reticulata*, B. M. t. 657, *Coburgia reticulata* and *Leopoldia reticulata*.
 — — *striatifo'lium*. 1. Purple. August. Brazil. 1815. Syn., *Amaryllis reticulata*, var. *striatifolia*, B. M. t. 2513.
 — *retine'rium*. 2. Scarlet. May. W. Indies. 1822.
 — *Ro'e'zii*. Light orange or brick-red. Bolivia. 1875.
 — *ro'seum*. ½. Bright red, greenish. Chili. 1831. Syn., *Habranthus roseus*, Swt. Fl. Gard. ser. 2, t. 107, and *H. pumilus*, B. C. t. 1771.
 — *rutilum*. 1. Bright crimson, green. S. Brazil. 1810. Syn., *Amaryllis rutila*, B. R. t. 23, and *Hippeastrum bubulosum*, var. *rutilum*.
 — — *acumina'tum*. Pale pink. Syn., *H.*

- pulverulentum*, B. M. t. 2273, *Amaryllis acuminata*, B. R. t. 534 and 1188, and *A. pulverulenta*, B. C. t. 484.
 — *H. rutilum citri'num*. Bright yellow.
 — — *croca'tum*. Safron-colour. Syn., *Amaryllis crocata*, B. R. t. 38.
 — — *fulgidum*. Bright scarlet, green. Syn., *Amaryllis fulgida*, B. R. t. 226, *A. miniata*, B. M. t. 1943, *Hippeastrum subbarbatum*, B. M. t. 2475, *H. ubulosum*, vars. *equestriforme*, *fulgidum*, *Simsianum*, *subbarbatum* and *unguiculatum*.
 — *Simsi'num*. See *H. rutilum*, var. *fulgidum*.
 — *solandri'form*. 1½. White, green. January. Guiana. 1820. B. M. t. 2573 and 3771.
 — — *striat'm*. Green, white.
 — *spalha'ceum*. B. M. t. 2315. Probably a variety of *H. equestre*.
 — *specta'bile*. B. C. t. 159. Garden hybrid.
 — *stylo'sum*. 1½. Bright fleshy-red. May. Guiana. 1821. Syn., *Amaryllis stylosa* and *A. maranensis*, B. R. t. 719.
 — *Swee'tii*. Garden hybrid.
 — *varia'bilis*. 1. Red, white. June. Cape of Good Hope. 1821.
 — *vitta'tum*. 3. White, red. April. Andes of Peru. 1769. Syn., *Amaryllis vittata*, B. M. t. 129.
 — — *Harrisonia'na*. White, red. Peru. 1874. B. R. t. 988.
 — — *latifo'lium*. White, red, green.

Hi'ppion. (From *hippice*, the name of a herb from Pliny, which, he said, if put into a horse's mouth, makes him insensitive to hunger or thirst. Nat. ord., *Gentianaceæ*.)

Half-hardy biennial. Sown in a hotbed, in spring, or the end of summer, and carefully kept in stoves and greenhouses during the winter, they will bloom early the following season.

- H. hyssopifo'lium*. See *Stevogia orientalis*.
 — *verticilla'tum*. See *Stevogia occidentalis*.
 — *visco'sum*. 2. Yellow. June. Canaries. 1781.

Hippobro'ma. (From *hippos*, a horse, and *bromos*, food. Nat. ord., *Lobeliaceæ*.) See *Isotoma*.

- H. brevifo'rum*. See *Isotoma breviflora*.
 — *longifo'rum*. See *Isotoma longiflora*.

Hippobro'mus. (From *hippos*, a horse, and *bromos*, food. Nat. ord., *Sapindaceæ*.)

Greenhouse shrub. Cuttings under a hand-glass in sand. Sandy loam.

- H. ala'tus*. Natal.

Hippocrep'is. Horse-shoe Vetch. (From *hippos*, a horse, and *crepis*, a shoe; referring to the form of the seed-pod. Nat. ord., *Leguminosæ*; Tribe, *Hedysarææ*.)

Hardy pea-blossomed, yellow-flowered plants. The annuals merely require sowing in the open border, in March or April; the herbaceous trailers require dividing at a similar period. *H. balea'rica* is the only shrub it resembles, and requires similar treatment to the Coronilla, needing a cold pit or a greenhouse in winter. *H. como'sa* is a useful rock plant.

- H. balea'rica*. 2. May. Minorca. 1776. Shrub. Jacq. Ic. t. 149.
 — *como'sa*. ½. April. England. Perennial trailer. Eng. Bot. ed. 3, t. 330.

H. glauca. $\frac{1}{2}$. May. Italy. 1819. Perennial trailer.

— *helvetica*. A synonym of *H. comosa*.

— *multisiliquosa*. 1. July. South Europe. 1570. Annual.

Hippo'mane. (From *Hippomanes*, a name used by Theophrastus for a kind of spurge. Nat. ord., *Euphorbiaceæ*. Syn., *Mancinella*.)

A stove tree with poisonous milky juice. Sandy loam and peat. Cuttings in sand under a hand-glass.

H. Mancinella. 50. Greenish. May. Central America. 1690.

Hippo'phæ. Sea Buckthorn. (From *hippos*, a horse, and *phao*, to kill. Nat. ord., *Elæagnaceæ*. Allied to *Shepherdia*.)

Hardy deciduous shrubs. Layers, suckers, cuttings of the roots, and seeds; common soil. These are first-rate shrubs for the sea-coast, for fixing sands along with *Ca'rex* and grasses.

H. argentea. See *Shepherdia argentea*.

— *canadensis*. See *Shepherdia canadensis*.

— *rhamnoides*. 12. May. England.

— *angustifolia*. 2. May. South England.

— *sibirica*. April. Siberia.

— *sabicefolia*. 8. Nepaul. 1822.

Hippu'ris. Mare's Tail. (From *hippos*, a horse, and *oura*, a tail; from a fancied resemblance of the plant to a horse's tail. Nat. ord., *Haloragacæ*.)

Perennial aquatic herb, suitable for the edge of a pond. Division of roots; seeds.

H. vulgaris. $\frac{3}{4}$. Greenish, red. Summer. Britain. Eng. Bot. ed. 3, t. 516.

Hip'tage. (From *hiptamai*, to fly; in allusion to the hairs on the seed, which assist in its dispersion by wind. Nat. ord., *Loganiacæ*; Tribe, *Gærtnereæ*. Syn., *Gærtnera*.)

Stove evergreen twiners; cuttings of firm young shoots in April, in sand, under a bell-glass, and in bottom-heat; peat and loam.

H. Madag'ca. 15. White, yellow. April E. Ind. 1793. Syn., *Gærtnera racemosa*.

— *obtusifolia*. 20. White. China. 1810. Syn., *Gærtnera obtusifolia*.

Hiræ'a. (Named after *De La Hire*, a French botanist. Nat. ord., *Malpighiacæ*; Tribe, *Hirææ*.)

Stove climbers. Cuttings of firm young shoots in sand, under a bell-glass, in bottom-heat; sandy, fibry loam, and fibry peat, with a little freestone or charcoal.

H. glaucescens. Yellow. A doubtful plant.

— *indica*. 10. White. July. E. Ind. 1820.

Syn., *Aspidopterys Rozeburghiana*.

— *nutans*. 10. White. July. E. Ind. 1820.

Syn., *Aspidopterys nutans*.

— *odorata*. See *Triaspis odorata*.

— *reclinata*. See *Triastellateia australasica*.

— *Simsiana*. 10. Yellow. August. 1793.

Syn., *Byrsonima volubilis*.

Hoa'rea. A section of the genus **Pelargonium**.

Hodgso'nia. (After *B. H. Hodgson*, F.L.S. Nat. ord., *Cucurbitaceæ*.)

A stove shrub, with slender climbing stems,

which are said to attain a length of 100 feet in their native country. Keep in a damp heat in summer, but more cool and dry in winter. Rich sandy loam. Seeds.

H. heteroclita. Yellow, white. May. Malay Archipelago.

Hoe. This is the implement which should be most frequently in the gardener's hand during summer, for the surface of the soil scarcely can be too frequently stirred. The handles should never be made of heavy wood, for this wearies the hand, and is altogether a useless weight thrown upon the workman. It is merely the lever, and every ounce needlessly given to this diminishes, without any necessity, the available moving power. The best woods for handles are birch or deal.

For earthing-up plants, broad blades to hoes are very desirable, and they may, without objection, have a breadth of nine inches; but for loosening the soil and destroying weeds, they should never extend to beyond a breadth of six inches, and the work will be done best by one two inches narrower. The iron plate of which they are formed should be well steeled, and not more than one-sixteenth of an inch thick. The weight necessary should be thrown by the workmen's arm and body upon the handle; and the thicker the blade, the greater is the pressure required to make it penetrate the soil. It should be set on the handle at an angle of 68°, as this brings its edge at a good cutting angle with the surface of the soil, and the workman soon learns at what point most effectively to throw his weight, and holds the handle further from, or nearer to, the blade, accordingly as he is a tall or short man. Mr. Barnes, of Bicton Gardens, employs nine sized hoes, the smallest having a blade not more than one-fourth of an inch broad, and the largest ten inches. The smallest are used for potted plants and seed-beds, and those from two inches and a half to four inches wide are used for thinning and hoeing among crops generally. These have all handles varying in length from eight inches and a half to eighteen inches, all the neck or upper part formed of iron, for the smaller sizes not thicker than a large pencil, and that part which has to be grasped by the workman is only six inches long, and formed either of willow or some other soft, light wood, which is best to the feel of the hand. Each labourer works with one in each hand, to cut right and left. The blade is made thin, and with a little foresight and activity it is astonishing how much ground can be got over in a short time.

Mr. Barnes has all his hoes made with a crane neck, as in the accompanying sketch No. 1. The blades broader than four inches Mr. Barnes has made like a Dutch hoe, No. 2.

No. 1.

No. 2.

The crane neck allows the blade to pass freely under the foliage of any crop where the earth requires loosening; and the blade works itself clean, allowing the earth to pass through, as there is no place for it to lodge and clog up as in the old-fashioned hoe, to clean which, when used on a dewy morning, causes the loss of much time.

The thrust, or Dutch hoe, consists of a plate of iron attached somewhat obliquely to the end of a handle by a bow, used only for killing weeds or loosening ground which is to be afterwards raked. As a man can draw more than he can push, most heavy work will be easiest done by the draw-hoe.

In the island of Guernsey a very effective weeding-prong is used, something in the shape of a hammer, the head flattened into a chisel an inch wide, and the fork the same. The whole length of this prong is nine inches, and it is attached to a staff five feet long. Such an implement is light and easy to use, it requires no stooping, and will tear up the deepest-rooted weeds.

Hoffmannia. (After Prof. Hoffmann, a German botanist. Nat. ord., *Rubiaceæ*; Tribe, *Hamelieæ*. Syn., *Higginsia*.)

Greenhouse evergreen shrubs. Cuttings of half-ripened shoots in sand, under a bell-glass, in spring; peat and loam. Winter temp., 38° to 45°; will thrive out of doors in summer.

H. discolor. †. Red. Leaves satiny-green above, red purple beneath. Mexico. 1850. Syn., *Campylobotrys discolor*. B. M. t. 4530. Stove.

— *Ghiesbreghtii.* 2-4. Yellow, spotted with red. S. America. 1861. Syn., *Higginsia Ghiesbreghtii*. B. M. t. 5383.

— *variegata.* Leaves variegated with cream-yellow and red.

— *mexicana.* Yellow. June. Mexico. 1840. Syn., *Higginsia mexicana*.

— *pedunculata.* 2-3. Yellow, red. Jamaica.

— *refulgens.* 1-2. Pale-red. May. S. America. Syn., *Higginsia refrulgens*. B. M. t. 5346.

— *regalis.* 1. August. Mexico. 1859. Syn., *Higginsia regalis*. B. M. t. 5280.

Hoffmanseggia. (Named after J. C. Hoffmansegg, Nat. ord., *Leguminosæ*; Tribe, *Eucæsalpineæ*.)

Stove, yellow, pea-blossomed evergreens. Cut-

tings of young shoots in sand, in bottom-heat; also division of the plant in spring; peat and loam.

H. falca'ria. 2. July. Chili. 1806.

— *prostrata.* July. Lima.

Hog-nut. *Carya porc'na.*

Hog-plum. *Spo'ndias.*

Hohenbergia. (Named after M. Hohenberg, a German botanist. Nat. ord., *Bromeliaceæ*; Tribe, *Bromeliææ*.) See *Æchmea*.

— *paniculi'gera.* See *Æchmea paniculigera*.

— *strobila'cea.* Now referred to *Ananas*.

Hoitzia. (From *hoitzil*, its Peruvian name. Nat. ord., *Polemoniaceæ*. Allied to *Polemonium*.) See *Læselia*,

H. cæru'lea. See *Læselia cærulea*.

— *cocc'nea.* Kn. and West. t. 99. See *Læselia coccinea*.

— *glandulo'sa.* See *Læselia glandulosa*.

— *mexica'na.* See *Læselia coccinea*.

Holarrhe'na. (From *holos*, entire, and *arrhen*, a male; referring to the anthers. Nat. ord., *Apocynaceæ*; Tribe, *Plumerieæ*. Allied to *Alstonia*.)

Stove evergreen. Cuttings of young shoots, as fresh growth has commenced, in sand, under a bell-glass, and in bottom-heat; peat and loam.

H. villo'sa. E. Ind. 1820.

Holbe'lia. (Named after F. L. Holboll, of the Royal Botanic Gardens, Copenhagen. Nat. ord., *Berberideæ*; Tribe, *Lardizabaleæ*. Allied to *Akebia*.)

Greenhouse or hardy climbers, from Nepal, valued for the fragrance of their dull flowers. Their fruit is eaten in India. Cuttings of half-ripened young shoots in sandy soil, under a glass; open, sandy loam, with a little peat; will stand in a cool greenhouse, in winter, and twine up the wires of a conservatory wall, in summer. *H. latifolia* is hardy against a wall.

H. acumina'ta. A synonym of *H. latifolia*.

— *angustifo'lia.* Purple. March.

— *latifolia.* 10. Green. March. 1845. B. R. 1846, t. 49.

Holcus. (From *holkos*, the Greek name of a grass. Nat. ord., *Gramineæ*.)

Hardy grass of no particular value.

H. lanat'us. †. Green. Britain.

— *albo-variegat'us.* Leaves with silvery-white, longitudinal stripes.

Holly. (*Ilex aquifolium*.) Of this hardy evergreen shrub there are numerous varieties of which the following are a selection:—1, Silver-edged; 2, Golden-edged; 3, Thick-leaved; 4, Prickly; 5, Yellow-leaved; 6, Variegated; 7, Spotted; 8, Recurved.

The holly will not thrive in any poor, light, sandy soil, or in a swampy situation, but likes a strong, deep, dry, loamy soil. If grown as single ornamental shrubs they should not be overshadowed by other trees; and if the land is manured, so much the better. As to pruning it, with a view to make it grow fast, the less you do of that the better. All that is necessary is to encourage the leader, by stopping any laterals that try to interfere with it. When plants are thin vigorous pinching of the laterals should be resorted to.

The most expeditious way of making *holly-hedges* is to procure large plants from some nursery; but, with the smallest expense and more time, the following may be recommended:—Gather a sufficient quantity of berries when ripe; then dig a hole three or four feet deep, and throw the berries in, crushing and mixing them with some fine soil at the same time; close the hole with the soil taken out, and throw some litter, or other covering, over the whole, to prevent the wet or frost penetrating. Take them up and sow them in March. They will make nice little plants the first season; and, by transplanting the stronger ones, you will have fine plants in about three years.

Large hollies are best moved in early May or about the third week in August. With a small cord tie up the lower branches, then mark a circle two feet from the bole of the tree, and another circle two feet beyond the first; the space between the two circles must have all the soil dug deeply out of it; whilst this is going on, let another labourer be digging a hole larger than the ball of the tree will require, making it rather deeper; fill in some of the best soil, chopped fine, and mix it with water till it forms a puddle of the consistence of thick paint. Gradually undermine the ball below the roots till it stands quite loose; then wrap some garden-mats round, and tie the ball firmly together with a strong rope; then wrap the stem round as near the soil as possible with some old carpet or sacking; tie to the stem at that part a stout pole eight or nine feet long; then lower the tree gently down, and let as many men as are necessary to carry it take hold of the pole, and remove the tree to its place, letting it down gently into the hole amongst the puddle, taking care that it is not below, but rather above, the general level; fill in good soil round the ball after the tree is set upright, and the mats, ties, etc., removed. Mix

this soil with water till it is a puddle like the bottom; secure the tree with props, to prevent the winds from shaking it.

The best time for cutting hollies is early in the spring, about the end of February, before they have begun to shoot. Never clip them with shears, but cut them in with a sharp knife.

Hollyhock. (*Althæa rosea.*) *By Cuttings.*—These are made from the young shoots that rise from the base of the strong flower-stems. They may be formed of the tops only, or, if the young shoots are long, they may be cut into lengths of two joints each, removing the lower leaf, and shortening in the upper one. To cause them to send forth roots, a gentle hotbed should be made either of well-fermented dung, tanner's old bark, or fresh-fallen leaves. As soon as the heat is moderated, place the frame upon it, and a covering of dry saw-dust upon the bed within the frame to the depth of five inches. Then prepare the cuttings, put them round the edge of pots filled with moist, sandy loam, press the earth close to the bottom of each cutting, and fill up the holes with a little more soil. Then plunge them nearly up to the rim in the saw-dust, but give no water, because they are very full of sap, and would damp off immediately. Shade closely and give no air, excepting a little at the back to let out the steam for an hour in the morning. In six weeks they will begin to show signs of growth, and should then have a little water given without wetting the leaves. When roots are formed, pot them off into small pots, place them in a cold frame kept close, and shaded for a week or two. Then gradually inure them to bear the full sun, and give plenty of air, and moderate but constant supplies of water. They are then ready for planting out. The best time to perform this is in early spring, but it may be done also in August, so as to have them rooted before the winter sets in.

By Division.—Large, strong plants, with numerous shoots, may be taken up as soon as they have done flowering, and be divided with a strong knife. Care must be taken that each division has a good share of roots, and at least one shoot to it. Plant these divisions in a bed in a shady part of the garden, but not under the drip of trees. They may remain here till March, and then are ready to plant out in the place where they are to flower.

By Seed.—Save seed from the most double and best coloured flowers. Clean it from the husks, and keep it in a dry drawer, or in a bag hung up in a dry room. Sow early in March in shallow, wide pans, in a gentle heat. When the seedlings are so large as to be readily handled, transplant them either into boxes three inches apart, or prepare a bed of rich earth in a frame without heat, and plant them out in it at the same distance from each other. As soon as the weather will permit, make a sufficiently large piece of ground very rich with well-decomposed hotbed dung, in a dry, open part of the garden. Take the plants up carefully with a garden trowel, keeping as much earth as possible to each. Carry them, a few at a time, in a basket, to the prepared ground, and plant them out in rows two feet apart, and one foot between each plant. There they may remain till they flower. Then mark such as are well shaped and bright coloured; cut them down, and plant them in the place where they are to flower next season, giving a name to each. Write in a book kept for the purpose a description of each, both of shape and colour. Single and badly-shaped flowers throw away at once.

Soil.—They must have a dry, deep soil, enriched with plenty of manure. If the situation is damp, they will die off in the winter, unless well drained, and the bed elevated above the natural level.

Summer Culture.—When the plants begin to grow in the spring, give them a mulching about two inches thick, with some light littery manure. This will protect the roots from the drying winds, and strengthen the flower-shoots. Place tall, strong stakes to them in good time, and as they advance in growth, tie the shoots separately to the stakes regularly, but not too tightly, and leave room for the stems to swell. During dry weather, give, once a week, a thorough good watering. If the flowers are intended for exhibition in spikes, cut off their extreme ends. This will cause the flowers to form a fine pyramid of bloom, and make them open more equally and much larger.

Winter Culture.—Cut down the flower-stem as early as possible after the bloom is over, and the seed is ripened. Dig the ground between the plants, leaving it moderately rough to mellow with the weather, adding a dressing of well-decomposed manure. Before the severe frosts are likely to set in, give a mulching of light, half-decayed dung, closing it round the plants. This will keep the

roots warm through the frosty weather, and will enrich the ground as it decays.

Varieties.—These are too numerous to note in detail, and many are very beautiful. Good results may be obtained from packets of mixed seedlings obtainable at any florists.

Insects.—The *green fly* will, in dry seasons, attack the leaves and young shoots. (See *Aphis*.) *Slugs* will also attack the young shoots. They must be diligently sought for and destroyed, or, if, very numerous, give the ground a watering with clear lime-water occasionally. In new ground, a *brown grub* is sometimes very destructive by eating off the young shoots just level with the ground. Nothing will kill these except hand-picking, the soil must be stirred with the hand, and the insects found and destroyed.

Diseases.—Sometimes they die off suddenly, the consequence of a too rich or too damp soil. Whenever a plant is struck with this disease it should be instantly removed. If it has any young, healthy shoots, they may be taken off and put in as cuttings. The place must have the soil removed for a foot square, fresh soil put in, and a new healthy plant inserted.

Hollyhock fungus. *Puccinia malvacearum*. For some years past the Hollyhocks and other *Malvaceæ* have been attacked and destroyed by this virulent pest. It is said to have been first detected in Chili, whence it has gradually spread to Australia, Britain, and the Continent.

Our illustration represents an infected leaf of the hollyhock reduced (Fig. a). At Fig. b is shown a section through one of the fungus pustules, representing the

fungus in fruit bursting through the skin of the leaf. Fig. c represents one of the two-celled spores magnified 250 diameters. Whenever this *Puccinia* attacks a Hollyhock, whether it be a

young or an old plant, it is pretty certain to kill it; and wherever it appears the plants attacked should be pulled up and burnt to prevent the spreading of the *Puccinea*; half measures are not of the least use.

Holly-leaf fly. *Phytomyza ilicis*. The Holly oftentimes has its leaves much disfigured by brownish blister-like patches, as represented by Fig. 1; these are caused by the larva of a small two-

winged fly, bearing the name given above. The larva lives within the leaf, feeding upon the tissue immediately beneath the upper epidermis, its position often being made visible as a darker spot (Fig. 2). The larva is about $\frac{1}{2}$ of an inch in length, and of a pale greenish colour; it changes to a brown pupa within the leaf, and the perfect fly emerges in the course of a few days. Fig. 3 represents the pupa, natural size, and Fig. 4 the same, magnified. The perfect fly (Fig. 5, magnified, the crossed lines Fig. 6 showing the natural size) is of a greenish-brown colour, having transparent iridescent wings, with brown nervures. Beyond greatly disfiguring the leaves, we do not know that it does any material harm to the Holly; neither can we suggest a remedy, unless smoking the bushes be of any avail. For our illustration we are indebted to the "Gardeners' Chronicle."

Holmskiöldia. (Named after *T. Holmskiöld*, a Danish botanist. Nat. ord., *Verbenaceæ*; Tribe, *Viticeæ*. Syn., *Hastingia*.)

Stove evergreens, with scarlet flowers, from the East Indies. Cuttings of young shoots, just getting firm at the base, in sandy soil, under glass, and in heat; sandy peat, and light, fibry loam.

H. sanguinea. 4. 1796. Shrub. B. R. t. 692. Syn., *Hastingia coccinea*.
— *scandens*. May. 1824. Climber. Syn., *Hastingia scandens*.

Ho'lothrix. (From *holos*, entire, and *thrix*, hair; small plants with minute leaves and flowers. Nat. ord., *Orchideæ*.)

Small terrestrial orchid. Warm stove; sphagnum, peat, and charcoal.

H. Lindleyana. White. S. Africa. G. C. 1888, iii. p. 364, figs. 55 and 56.

Homalanthus. (From *homalos*, smooth, and *anthos*, a flower. Nat. ord., *Euphorbiaceæ*; Tribe, *Crotoneæ*. Allied to *Hippomane*.)

Stove evergreen shrub. Cuttings of firm shoots in sand, in heat; loam and peat.

H. peltatus. Greenish. Philippines. 1866. Syn., *Dibrachion peltatum* and *Mappa fastuosa*.

— *polyandrum*. Lord Howe's Island. 1876. Syn., *Carumbium polyandrum*.

— *populifolia*. 6. White. August. N. Holland. 1825.

Homalium. (From *homalos*, smooth. Nat. ord., *Samydaceæ*. Syn., *Astranthus*.)

Greenhouse evergreen shrub; cuttings in sandy soil, under a glass; rich, light loam.

H. cochinchinensis. 4. White. July. China. 1823. Syn., *Astranthus cochinchinensis*. B. M. t. 2659.

Homalome'na. (From *homalos*, flat, and *mene*, moon; a translation of the native name of some species of this genus, the application is not apparent. Nat. ord., *Araceæ*. Syn., *Homalonema*.)

Stove evergreen dwarf shrubby plants. Seeds, divisions of the stem. Fibrous peat and a little sharp sand; sometimes broken charcoal and rotten leaves are mixed with the peat, but they do equally well without it. Moist atmosphere, shade.

Hoo'dia. (Commemorative. Nat. ord., *Asclepiadaceæ*; Tribe, *Stapelieæ*. Allied to *Boucerosia*.)

Greenhouse succulent perennials, with thick, cylindric, many-angled stems, armed with spines. The large and curious flowers are produced at the summit of the stems. Seeds, and cuttings of the young shoots, which should be cut off as close as possible to the stem, and placed in the sun for several days, to allow the wound to cicatrize; then insert in a soil composed of one-third brick-rubbish, one-third sand, and one-third rich loam, place in full sunlight, and keep very slightly damp. In summer, when growing freely they may be well watered; in winter, give only just enough water to prevent the soil going dust-dry. Summer temp., 70° to 90°; winter, 60° to 70°—always in full sunlight.

Hornbeam. *Carpinus*.

Horn-of-plenty. *Fed'ia*.

Horn-poppy. *Glaucium*.

Horse-chestnut. *Æsculus*.

Horse-radish. (*Cochlea'ria armo-ra'cia.*) Delights in a deep, rich soil, banks of a ditch, etc. Should the ground require manure, it should be dug in at the depth at which the sets are intended to be planted. It is propagated by sets, provided by cutting the main root and offsets into lengths of two inches. The tops, or crowns of the roots, form the best, those taken from the centre never becoming so soon fit for use, or of so fine a growth. Each set should have at least two eyes; for without one they refuse to vegetate at all. For a supply of the crowns, any inferior piece of ground planted with sets six inches apart and six deep, will furnish from one to five tops each, and may be collected for several successive years with little more trouble than keeping them clear of weeds; but the times for planting are in October and February.

Insert the sets in rows eighteen inches apart each way. The ground trenched between two and three feet deep, the cuttings being placed along the bottom of the trench, and the soil turned from the next one over them. The earth ought to lie lightly over the sets; therefore treading on the beds should be carefully avoided. The shoots make their appearance in May or June, or earlier if the sets were planted in autumn.

Remove the leaves as they decay in autumn, the ground being also hoed and raked over at the same season, which may be repeated in the following spring.

In the succeeding autumn they merely require to be hoed as before, and may be taken up as wanted. By having three beds devoted to this root, one will always be lying fallow and improving; of which period advantage should be taken to apply any requisite manure.

Taking up.—To take them up, a trench is dug along the outside row down to the bottom of the roots, which, when the bed is continued in one place, may be cut off level to the original stool, and the earth from the next row then turned over them to the requisite depth; and so in rotation to the end of the plantation. By this mode a bed will continue in perfection for five or six years, after which a fresh plantation is usually necessary. But the best practice is to take the crop up entirely, and to form a plantation annually; for it not only causes the roots to be finer, but also affords the opportunity of changing the site. If this mode is followed care must be taken to raise every lateral root; for almost the smallest will vegetate if left in the ground.

Horse-radish Tree. *Mori'nga.*

Horse-shoe Vetch. *Hippocere'pis.*

Horse-thistle. *Cni'cus.*

Horsfie'ldia. (Dedicated to *Dr. Horsfield*, a traveller and collector in Java. Nat. ord., *Araliaceæ.*)

Stove evergreen shrub, armed with spines. For cultivation, see ARALIA.

H. aculea'ta. Java. 1866.

Hort. A contraction of the Latin *hortensis*, appertaining to a garden. Often added to the name of a plant of garden origin.

Horte'nsia opuloi'des. See *Hydra'ngea horte'nsis.*

Hosa'ckia. (Named after *Dr. Hosa'ck*, an American botanist. Nat. ord., *Leguminosæ*; Tribe, *Lotææ.* Allied to *Ononis.*)

Hardy plants, with yellow flowers, except where otherwise mentioned. Suitable for front of borders and rock-works; seeds and division of the plants in spring; cuttings of perennials in summer, under a handlight.

— *longifo'lia.* A synonym of *Cornutia longifo'lia.*

Hotbed is a bed of earth, or other material, usually covered by a glazed frame, and heated artificially, and employed either for forcing certain vegetables, for raising seedlings, or for striking cuttings. It is heated either by dung, leaves, tan in a state of fermentation, or by hot water.

Hotbed of Stable Dung: Preparation of Dung.—We will commence with the dung fresh at the stable door: the first thing is to throw it into a close body to "sweat." Those amateurs who have plenty, and to spare, will do well to shake it over loosely,

and reject a portion of the mere droppings; for these require the most purifying, and, moreover, engender an over-powerful, and sometimes unmanageable heat, which, in unpractised hands, is capable of much mischief. The main bulk of the material thus thrown together will, in a week or so, become exceedingly hot, and must then be turned completely inside out; and, in so doing, every lock or patch which adheres together must be divided. Water will now be requisite, and must be regularly applied as the work proceeds, rendering every portion equally moist. After the mass has lain for about four days longer, it is well to administer a liberal amount of water on the top; this will wash out at the bottom of the heap much of its gross impurities. In a few more days it must be again turned inside out, using water if dry in any portion, and after laying nearly a week it should be almost fit for use; but it is well to give it even another turn. If any tree-leaves, strawy materials, etc., or any simple vegetable matter is to be added to the mass, it may be added at the last turning but one. The heap ought now to be "sweet," and such may be readily ascertained even by unpractised persons; for a handful drawn from the very interior, and applied to the nostrils, will not only be devoid of impure smell, but actually possess a somewhat agreeable scent, similar to the smell of mushrooms.

Beds.—All things will now be in readiness for building the bed, and one necessary point is to select a spot perfectly dry beneath, or rendered so. It must, moreover, be thoroughly exposed to a whole day's sun; but the more it is sheltered sideways the better, as starving winds, by operating too suddenly in lowering the temperature, cause a great waste of material as well as labour. The ground plan of the bed, or ground surface, should be nearly level. A good builder, however, will be able to rear a substantial bed on an incline; and such is not a bad plan, so forming the slope as to have the front, or south side, several inches below the back; the front being *with* the ground level, the back raised above it. By such means there will be as great a depth of dung at front as back, which is not the case when the base is level; for then, unluckily, through the incline necessary for the surface of the glass, the dung at back is generally much deeper than the front, at which latter point most heat is wanted. Good gardeners not unfrequently use a portion of weaker material at the back, such as littery stuff, containing little power as to

heat. It is well, also, to fill most of the interior of the bed, after building it half a yard in height, with any half-decayed materials, such as half-worn linings, fresh leaves, etc. This will, in general, secure it from the danger of burning, whilst it will also add to the permanency of the bed.

For winter-forcng a bed should be at least four feet high at the back—if five feet, all the better; and as soon as built let some littery manure be placed round the sides, in order to prevent the wind searching it. As soon as the heat is well up, or in about four days from the building of it, the whole bed should have a thorough watering. It is now well to close it until the heat is well up again, when a second and lighter watering may be applied; and now it will be ready for the hills of soil any time.

In making the hills of soil for the plants, in forcing melons or cucumbers, make a hollow in the centre of each light, half the depth of the bed. In the bottom of this, place nearly a barrowful of brick-bats, on this some half-rotten dung, and finally a flat square of turf, on which the hillock is placed. It is almost impossible for the roots of the plants to "scorch" with this precaution.

As the heat declines, linings, or, as they might be more properly called, coatings, are made use of, which consist of hot fermenting dung laid from eighteen to twenty-four inches, in proportion to the coldness of the season, etc., all round the bed to the whole of its height; and if founded in a trench, one equally deep must be dug for the coating, it being of importance to renew the heat as much as possible throughout its whole mass. If, after a while, the temperature again declines, the old coating must be taken away, and a similar one of hot dung applied in its place. As the spring advances, the warmth of the sun will compensate for the decline of that of the bed; but as the nights are generally yet cold, either a moderate coating, about nine or ten inches thick, is required, or the mowings of grass, or even litter may be laid round the sides with advantage.

Various structures have been suggested, whereby the heat only of fermenting dung is employed, and its steam is prevented from penetrating within the frame. One of the best of these structures is the following, proposed by Mr. West:

D D, chamber in which the dung is placed, three and a half feet deep, surrounded by nine-inch brickwork. One half of this is filled longitudinally with dung at the commencement, which, if

kept close shut up, will last twelve or eighteen days, according to the quality of the dung. As the heat declines, the other side is filled, and the temperature

is further sustained by additions to the top of both as the mass settles. When this united heat becomes insufficient, the side first filled being cleared, the old manure must be mixed with some fresh, and replaced, this being repeated alternately to either heap as often as necessary. A A, are the doors, two of which are on each side for the admission of the dung. They are two and a half feet square, fitted into grooves at the bottom, and fastened by means of a pin and staple at the top. B B, are small areas sunk in front, surrounded by a curb of wood; G G G, are bars passed longitudinally as a guide and support in packing the dung; C, represents a bar of cast iron, two inches wide, and three quarters of an inch thick, placed on the edge of which there is a row, a foot asunder, across the chamber, to support a layer of small wood branches and leaves, H, for the purpose of sustaining the soil, K, in the upper chamber; E E, represents the orifices, of which there are a series all round the pit, communicating with the flue F F F, which surrounds the beds; the exterior wall of this flue is built with bricks laid flat, the inner one of bricks set on edge. The flue is two inches wide, and, for the sake of strength, bricks are passed occasionally from side to side as ties. The top of the flue, and the internal part of the wall, which rises at the back and front to the level the earth is meant to stand, are covered with tiles, over the joints of which slips of slate, bedded in mortar, are laid, to prevent the escape of the steam of the dung; I, represents one of two plugs, which stop holes left to regulate the heat and steam as may be necessary. The outer wall supports the lights. For the convenience of fixing the dung, it is best to fill half of the chamber at the commencement, before the branches, mould, etc., are put in.

Hot-Water Beds.—If hot water be the source of heat, the following sketch of

the bed and frame employed by Mr. Mitchell, at Worsley, is about the best that can be employed. The objects kept in view when it was constructed, were—1st. A circulation of air without loss of heat. 2nd. A supply of moisture at command, proportionate to the temperature. 3rd. A desirable amount of bottom-heat. 4th. A supply of external air (when necessary) without producing a cold draught.

The method by which the first of these is accomplished will be understood by referring to the section, in which *a* represents the flow-pipes, *b b b* the return-pipes in the chamber A. It is evident that, as the air in the chamber becomes heated, it will escape upwards by the opening C, and the cold air from the passage B will rush in to supply its place; but the ascending current of heated air, coming in contact with the glass, is cooled, descends, and entering the passage B, passes into the chamber A, where it is again heated; and thus a constant circulation

is produced. In order to obtain the second object, to some extent are combined the tank-and-pipe systems. The flow-pipe *a* is put half its diameter into the channel C, which, when filled with water (or so far as is necessary), gives off a vapour, exactly proportionate to the heat of the pipe and pit.

The third requisition is produced by the surrounding atmosphere and heating materials. The fourth is accomplished simply by lowering the upper sash; the cold air thus entering at the top only, falls directly into the passage B, and passes through the hot chamber before coming in contact with the plants. When the heat in the chamber is 95°, in the open space over the bed it is 71°; in the bottom of the passage only 60°; and in the mould in the bed it is 80°. The amount of vapour is regulated with the greatest facility, even from the smallest quantity to the greatest density.—*Gard. Chron.*

Ho'vea. (Named after *A. P. Hove*, a Polish botanist. Nat. ord., *Leguminosææ*; Tribe, *Genistææ.* Syn., *Poiretia*. Allied to *Lalage*.)

Greenhouse evergreen shrubs, from Australia and Tasmania, with purple flowers, except where otherwise mentioned. Seeds, which should be sown in a hotbed, and moistened in warm water before sowing; cuttings of young side-shoots in April or May, in sand, under a bell-glass, and kept in a close frame; sandy peat with a very little fibry loam, and pieces of charcoal and freestone, or small pieces of pounded bricks. In summer they should be a little shaded from bright sunshine.

H. lanceolata, purpurea, rosmarinifolia, and villosa are sometimes regarded as varieties of *H. longifolia.*

Hove'nia. (Named after *D. Hoven*, a Dutch senator. Nat. ord., *Rhamnaceææ*; Tribe, *Rhamnææ.* Allied to *Alaternus*.)

Greenhouse evergreen shrubs, with white flowers. Cuttings of ripe young shoots in sand, under a glass; sandy loam and a little peat. Winter temp., 40° to 45°. *H. dulcis* has stood against a wall in the Horticultural and Kew Gardens, with a little protection.

- H. acerba*. B. R. t. 501. A synonym of *H. dulcis*.
 — *dulcis*. 8. July. Japan, China, and Sub-tropical Himalayas. 1812.

Hoy'a. Honey Plant. (Named after Mr. Hoy, once gardener at Sion House. Nat. ord., *Asclepiadaceæ*; Tribe, *Marsdenieæ*.)

Stove evergreen twiners. Cuttings inserted in almost any open soil, and plunged in a moist heat, root quickly; even the leaves will root and soon produce a plant; peat and loam, with a considerable portion of little pieces of pounded bricks and lime-rubbish. They flourish best in the temperature of the stove, and full exposure to the sun; but in winter they should be kept rather dry, and in the temperature of a warm greenhouse—45°, 50°, or even lower.

Hudsonia. (Named after W. Hudson, F. R. S., author of the *Flora Anglica*. Nat. ord., *Cistineæ*. Allied to *Helianthemum*.)

Half-hardy evergreens, from North America, with yellow flowers. Generally by layers in spring and autumn, and cuttings in sand, during summer, under a hand-light; sandy peat, and a moist situation. They require a little protection in winter, and may be placed in a pit. Unlike any other group of the order, the foliage more resembles a Heath than a Cistus.

Huernio'psis. (From *Huernia*, and *opsis*, like; the flowers resemble those of *Huernia*. Nat. ord., *Asclepiadaceæ*; Tribe, *Stapelieæ*. Allied to *Stapelia*.)

A very dwarf greenhouse succulent. For cultivation, see **STAPELIA**.

- H. deci'piens*. †. Crimson-brown, yellow. Diamond Fields, S. Africa. 1877.

Huma'ta. (Probably from *humatus*, interred; the stems being deep in the earth. Nat. ord., *Filices*.) Now united with **Davallia**.

Stove ferns, with brownish-yellow spores. Division; peat and loam. See **FERNS**.

- H. angusta'ta*. April. Singapore.
 — *heterophylla*. April. Samaria.
 — *pectina'ta*. April. Isle of Luzon.
 — *peda'ta*. May. E. Ind.
 — *Tyermanii*. W. Coast of Africa. 1871. Syn., *Davallia Tyermanii*.

Humble Bee. *Bo'mbus terre'stris*. This insect is of much use in fertilizing certain leguminous plants (especially Red Clover), by carrying the pollen from one flower to the stigma of another, with the consequent production of seeds. It is attracted to the flowers by the nectar situated near the base of the petals to obtain which it occasionally bores through the calyx, but the damage it does is small in comparison with the benefit it more frequently renders.

Humble Plant. *Mimo'sa pu'dica*.

Hu'mea. (Named after *Lady Hume*. Nat. ord., *Compositæ*; Tribe, *Inuloidææ*.)

Greenhouse biennial. Sow in heat, in spring; prick out and grow under glass; place out of doors in the heat of the summer; hough in good time in the autumn; shift into larger pots as wanted, and transfer to its blooming-pots in April, or plant out in good, rich soil in May. Single plants in a sheltered corner have a fine effect.

- H. e'legans*. 6. Red. July. N.S. Wales. 1800. Syn., *Calomeria amaranthoides*.

Hu'mulus. The Hop. (From *humus*, the ground; creeping on the ground if not supported. Nat. ord., *Cannabinaceæ*.)

Hardy twiners. *H. japo'nicus* is an annual; *H. lupu'lus*, a perennial. Seeds and divisions in spring; deep, loamy soil. It is useful for summer shade, as it grows very quick.

- H. japo'nicus*. Yellowish. Japan. 1885. G. C. 1885, xxiv, p. 716.
 — *lupu'lus*. 15. Yellow. July. Britain. Eng. Bot. ed. 3, t. 1284. Common hop.
 — — *variega'tus*. 15. Yellow. July. Britain.

Hu'mus. When the putrefaction of dead plants is completed, there remains

a soft, black mass, known as vegetable mould, or humus. One hundred parts of the humus of wheat straw have of extractive, or apotheme, rather more than twenty-six parts, and the residue is lime, peroxide of iron, phosphate of lime, and carbonaceous matter. This apotheme is identical with the humic acid of Liebig, the ulmic acid of Braconnot, and the geic acid of Berzelius. It contains—carbon, 46.6; hydrogen, 20.0; oxygen, 33.4. It was once believed, indeed, is still believed by a few men of science, that this apotheme is the immediate fertilizing component of organic manures, being soluble under some circumstances, and entering at once into the roots of plants, dissolved in the moisture of the soil. But every relative research of more modern chemistry is against this conclusion; and it is now tolerably certain, that a chief nutritive portion of vegetable manures is their carbon converted into carbonic acid, absorbed either in solution with the earth's moisture, or in gaseous form by the roots.

Hungarian Lotus. *Nympha'æa thermalis*.

Hunnema'nnia. (Named after *J. Hunnemann*, a botanical agent. Nat. ord., *Papaveraceæ*; Tribe, *Hunnemannieæ*. Very closely allied to *Eschscholtzia*.)

Half-hardy herbaceous perennial. Seeds in spring; rich soil; will bloom the second year with greenhouse treatment, or may be kept over the winter in a dry, cold pit.

- H. fumaricaefolia*. 2. Yellow. Mexico. 1827. B. M. t. 3061.

Huntleya. (Named after the *Rev. Mr. Huntley*, a zealous collector of plants. Nat. ord., *Orchideæ*; Tribe, *Vaniliceæ-Cyrtopodieæ*.) Now regarded as a section of **Zygopetalum**, which see.

- H. melea'gris*. See *Batemannia melea'gris*.

Hu'ra. Sand-box tree. (The native name. Nat. ord., *Euphorbiaceæ*. Allied to *Hippomane*.)

Stove evergreen trees, with whitish-yellow flowers. Seeds, and cuttings of ripe young shoots under a bell-glass, in sandy soil, and in heat; rich loam and peat.

- H. cre'pitans*. 12. S. Amer. 1733.
 — *stre'pens*. 12. S. Amer.

Hurdles of iron are the most eligible modes of fencing, whether for permanency or temporary purposes. They are invisible at a short distance, elegant, and durable. See **Railing**.

Hurtle-berry. The fruit of *Vaccinium Vitis-Idæa*.

Husky. The dung for a hotbed, when too dry, is said to be husky.

Hutchinsia. (Named after *Miss Hutchins*, an accomplished Irish cryptogamist. Nat. ord., *Cruciferae*; Tribe, *Thlaspidaceae*. Allied to *Iberis* and *Teesdalia*.)

Annuals, by seeds in April, in dry situations. Herbaceous perennials, by seed and divisions in spring, and cuttings under a hand-light, in summer; sandy loam, with a little peat or leaf-mould, and dry situations, such as banks or rock-work.

HARDY ANNUALS.

H. petraea. $\frac{1}{2}$. White. April. England. Eng. Bot. ed. 3, t. 151.
— *procumbens*. $\frac{1}{2}$. White. May. South Europe. 1823. Now referred to *Capsella*.

— *stylisa*. $\frac{1}{2}$. White, pink. June. Caucasus. 1825.

Hyacinthus. The Hyacinth. (In mythology, a beautiful boy, who, after being killed, was transformed into this flower. Nat. ord., *Liliaceae*; Tribe, *Scilleae*.)

Offsets from the bulbs, after the foliage has died down in summer; light, rich, sandy loam, with a little leaf-mould. A valuable bulb for forcing. Best florists' kinds grown out of doors, should be taken up after the foliage is withered, kept in shelves and drawers until the end of autumn, and then planted and protected from severe frost in winter, and frost and heavy rains in spring, by an awning. For a brilliant outdoor display, where the kinds are not so valuable, the roots may remain in the ground many years if top-dressed, and the bulbs are not too near each other. When grown in pots, these should be deeper than usual, in proportion to the diameter—nine inches are not too much. The compost we have found most suitable for them in pots is a good loam, three-fourths, and decayed cow-dung, two years old, one-fourth. In October they ought to be potted, and immediately plunged in tan or ashes, quite overhead, at least two inches. In potting, make the soil very firm under the bulb, to prevent the roots going directly down too soon. In a month after potting and plunging, a few may be brought into heat, and forced to flower about Christmas; and others may be brought in, month after month, to supply flowers till May. To grow them in water, glasses with a hollow cup at the top, to hold the bulb, are used. It is not good to begin too soon with glasses. December is quite early enough. After being kept for a few days in slightly-damped sand, they should be placed in their glasses. At first the water should only just touch the base of the bulbs, and the glasses should be kept in a dark closet until the roots have attained the length of an inch. Two drops of spirit of hartshorn may be added to the water in each glass when the bulbs are growing, and whenever the water is changed. Dark-coloured glass is always to be preferred, as the absence of light is natural to all roots. By keeping the glasses in a dark closet until the roots are full an inch long, the hyacinths will not get top-heavy, but the roots, being in advance of the leaves, will preserve the plant balanced erect. The bloom will also be finer, as the roots will be in a state to nourish the leaves before these

are prematurely advanced. A piece of charcoal put into each glass prevents putridity in the water.

Hybanthera. (From *hybos*, a curve, and *anthera*, an anther, or pollen-bag; referring to the curve in the gouty anthers. Nat. ord., *Asclepiadaceae*.) See **Tylophora**.

H. coraisfolia. See *Tylophora calcarata*.

Hybernia defolia'ria. The Mottled Under Moth. The caterpillars of this moth are very destructive to many fruit trees, especially cherries, by eating the leaves and fruit, even when the latter is unripe. It belongs to the group known as "loopers," and is reddish-brown above edged with a black wavy line, bright yellow at the sides shading to greenish on the under surface. The moths appear about October. The males are winged; the front wings are brownish with two darker bands and a dark spot between them; the hind wings are paler. The wings of the females are very small, and quite insufficient to enable the insect to fly. Such being the case, they can be prevented from ascending the tree by placing round it a band of sticky matter. As the caterpillars go to the ground to enter the chrysalis state, the latter can be destroyed by burying the surface soil in autumn, before the moths emerge.

Hybernia brumata. See *Cheimatobia brumata*.

Hybrid. (From *hubris*, violence.) A plant produced from seed, which has been impregnated with the pollen of another species, variety or occasionally genus.

Hybridizing. This may be considered as one of the higher branches of the art of Gardening, since by its practice the gardener is able to produce a new and distinct organism. In the mere mechanical operation of hybridizing, or cross breeding, there is no great amount of skill required, but in order to insure a greater probability of success, there is often required an amount of knowledge, of a nature which every gardener does not possess, and perhaps has no direct means of obtaining.

The first thing to do is to acquire as thorough a knowledge of flower structure as possible. The more thorough that knowledge is, the better; for although a general knowledge is sufficient to work upon, it should be remembered that he who has the deeper knowledge is the most likely to obtain the best results.

The parts of a flower necessary to produce seed are the *pistil*, and *stamens*. The *pistil* is the organ that occupies the centre of a flower, and generally consists of three parts, viz. a swollen part at the base, called the *ovary*; this part contains the *ovules* or unfertilized seeds. From the top or side of the ovary arises the *style*; this is usually elongated, slender, and thread-like, but sometimes short and stout, or absent. At the apex of the style is placed the *stigma*, which is sometimes simple, and sometimes lobed or branched. Around the pistil, which is the female organ of the flower, are arranged the *stamens*, which are the male organs. A stamen usually consists of two parts—the *filament*, which is generally slender and thread-like, and the *anther*, which is the oblong body terminating the filament. The anthers contain a fine powder called *pollen*, which they discharge when mature. Sometimes the filament is extremely short or altogether absent, when the anther is generally seated upon the corolla, as in the primrose. Fertilization is effected by the application of the pollen to the stigma, and hybridizing is the fertilization of one species by pollen taken from another species. When pollen is placed or falls upon the stigma, each pollen-grain sends out a slender tube, which grows down through the style into the interior of the ovary, and applies itself to the mouth of an ovule and fertilizes it. Without this no seed would result.

In many genera, such as *Begonia*, *Erica*, *Pelargonium*, etc., hybridization is very easily effected, and needs scarcely any more knowledge than that above given. But there are other genera which

are not so easy to hybridize, and when hybridizing between different genera is tried, the difficulty increases. In some cases the failures (for, in spite of the many successes in hybridizing, failures might be counted by the score) are perhaps due to some constitutional or physical cause, which renders hybridizing between the plants selected impossible; but in some, perhaps many cases, it is probable that the failure is due to a want of knowledge on the part of the operator.

In hybridizing species belonging to the same genus, the operator should first observe if, when the pollen of the one species is discharged from the anthers, the stigma of the other species is in a fit condition to receive it, for if this be not the case, it is not of much use to attempt to hybridize, as in all probability failure would be the result.

The most successful mode of obtaining good and very distinct varieties is to employ the pollen from a male flower grown on another plant than that bearing the female parent. To avoid previous and undesired impregnation, the anthers in the female parent, if they are produced in the same flower with the pistils, must be removed by a sharp-pointed pair of scissors, and the flower inclosed in a gauze bag, to exclude insects, until the desired pollen is ripe. Another effectual mode of avoiding undesired impregnation is bringing the female parent into flower a little earlier than its congeners, and removing the anthers as above described: the stigma will remain a long time vigorous if unimpregnated.

In most plants the stamens and pistil exist in the same flower; in others they are separate in different flowers upon the same plant, and in others still one plant will have all staminate flowers, and another all pistillate ones. In the case of those plants which have the stamens and pistil in the same flower, or hermaphrodite flowers as they are called, some ripen their pollen at the same time that the stigma of the same flower is fully developed and ready to receive it. If both plants selected to hybridize do this, hybridization will probably not be difficult to effect. But in other plants the anthers discharge their pollen before the stigma of the same flower is ready to receive it, or the stigma is perfected and its functions ceased before the anthers of the same flower are ready to discharge their pollen. In such cases it is necessary to observe if the stigma is properly developed before applying the pollen to it; this may often be known by the

appearance of a secretion upon its surface; or if the stigma is lobed or branched, it is most fully developed when these are most widely expanded. The nectaries also secrete honey more copiously at the times when the stigma and anthers are most mature. Another fact that should be taken into account when hybridizing, is that some flowers in a natural state are only fertilized by particular insects, which only fly during certain hours of the day; and in accordance with this, the flowers only give out their perfume during those hours, some in the morning, some in the afternoon, others in the evening or at night, and there can be very little doubt that if plants to be hybridized are acted upon during the time when their perfume is greatest, fertilization will be more likely to result than if the pollen be applied at a time when they are not giving out an odour.

Some plants, such as those of the genus *Primula*, many *Rubiaceæ*, etc., have the anthers and stigmas placed at different heights in the flowers of different plants of the same species. In *Primula* the flowers of some plants have the anthers seated at the mouth of the tube of the corolla, the styles of these flowers being short, so that the stigma only reaches to about halfway up the corolla tube (commonly called thrum-eyed flowers); in others the anthers are placed in the middle of the tube, and in these the style is long, so that the stigma is nearly on a level with the mouth of the corolla tube (pin-eyed flowers). These two forms of flower are now spoken of as short-styled and long-styled flowers, and in hybridizing or raising improved varieties of this or any other genus that has long and short styled flowers—a character that should always be looked out for by hybridizers—the operator should take the pollen from a short-styled flower if he wishes to fertilize a long-styled flower, or from a long-styled flower if he wishes to fertilize a short-styled flower, as being likely to give better results than if two long-styled or two short-styled plants are intercrossed.

Plants belonging to different genera are more difficult to hybridize than those belonging to the same genus. And when it is desired to intercross two genera in order to improve the habit of flowers, care should be taken to select genera that are as nearly related to each other as possible, and in fertilizing, all the points above alluded to should be taken into consideration.

In all cases when hybridizing, the flower to be fertilized should have its

anthers cut out before they discharge their pollen, in order to prevent any chance of self-fertilization; and the flower should be marked by loosely attaching a label, on which the name of the pollen-producing plant wherewith it was fertilized, and other particulars, should be written. When possible, also, it should be covered over with a gauze net for a time, so as to prevent the chance of insects bringing to it pollen from another flower of the same species, in which case the probabilities of obtaining a hybrid from the seed would be very small, as the pollen of the same species is generally more potent than that of another species, even though it is applied after the pollen of another species has been upon the stigma for some little time, providing the stigma is still receptive.

The conditions of temperature, light, shade, and water should also be carefully attended to; these, of course, would be very different for different plants, but in all cases the nearer the natural conditions under which the hybridized plant flowers and perfects its seed in its native habitat are imitated, the greater will be the chance of success. With some plants a little more direct sunlight during the development of the seed would probably be very beneficial.

Hydra'ngæa. (From *hydor*, water, and *aggeion*, a vessel; referring to the cup-form of the capsule, or seed-vessel. Nat. ord., *Saxifragæ*; Tribe, *Hydrangeæ*.)

Deciduous shrubs. Propagated by division of the roots, cuttings of the ripened shoots, and flourishing best in moist, sheltered places. *Hortensis*, the common garden *Hydrangea*, though a little more tender, stands the winter well in the southern parts of the island; and though cut down in most winters in the neighbourhood of London, yet, if a slight protection of mulching is thrown over the roots, the stems will rise strongly, and bloom well after Midsummer, if care be taken to remove all the weaker ones, just as is done with a *Fuchsia* stool. This species makes, also, fine ornaments in pots, and may be propagated at almost any time; the young side-shoots, when two or three inches in length, inserted in sandy soil and in heat, striking in a few days, while the old stems will strike anywhere, but require their time. To grow it well requires light, rich compost, well drained, and abundance of water. The flower generally appears first of a greenish colour, becoming of a pale rose; but in some districts the colour becomes a beautiful blue. Notwithstanding all the experiments that have been made, there is still a little doubt as to the cause that produces the change. When iron filings and a solution of alum are used, in some soils the blue colour is produced, while the same means will not produce it in others; and other soils will almost invariably produce this blue colour without any peculiar matter whatever being added. The loams at Kenwood, at Hampstead Heath, and

Stanmore Heath, and the peats at Wimbledon, as well as some bogs near Edinburgh, are famous for producing this blue in the Hydrangea. When trying artificially with iron filings and alum-water, we have had different colours on the same plant. This variation is merely temporary—it cannot be propagated like a variety: a cutting from a blue plant will produce a rose one, unless the peculiar treatment be continued.

Hydrastis. Yellow Root. (From *hydor*, water; referring to the marshy places where it grows. Nat. ord., *Ranunculaceæ*; Tribe, *Helleboreæ*. Allied to *Helleborus* and *Caltha*.)

Hardy herbaceous perennial. Division of the root; loam and peat; moist situation.

- H. canadensis*. ½. Green. May. N. Amer. 1759. B. M. t. 3019 (flower), and 3232 (fruit).

Hydrocotyle. (From *hydor*, water, and *cotyle*, a flat-cup; the peltate leaves

of many species being somewhat cup-shaped. Nat. ord., *Umbelliferae*; Tribe, *Hydrocotyleæ*.)

Dwarf marsh perennials, with round or kidney-shaped leaves. Seeds; cuttings or layers. Wet boggy soil. There are several species in Botanic Gardens.

- H. asiatica*. ½. Pinkish. Asia and America. 1809. Wight Ic. t. 565.

Hydroglossum. A synonym of **Lygodictyon**.

Hydrolea. (From *hydor*, water, and *elava*, oil; referring to the marshy habitat and oily feel of the leaves. Nat. ord., *Hydrophyllaceæ*; Tribe, *Hydroleæ*.)

Greenhouse herbaceous plants. Divisions, cuttings, and seeds; *spinosa* is a small aquatic, growing best in peat and loam; *quadrivalvis* is also found in boggy places.

- H. quadrivalvis*. Pale blue. July. Carolina. 1824. Syn., *H. caroliniana*.

- *spinosa*. 1. Blue. S. Amer. 1791. B. R. t. 566.

Hydromestus. (From *hydor*, water, and *mestos*, half; referring to the plant living in water during the rainy season. Nat. ord., *Acanthaceæ*.)

Stove evergreen shrubs. Cuttings of young shoots any time in spring and summer, in sandy soil, and bottom-heat; peat and loam. Summer temp., 60° to 80°; winter, 48° to 55°.

- H. maculatus*. 2. Yellow. May. Mexico. 1842. B. M. t. 4556. Now known as *Aphelandra Hydromestus*.

Hydropeitis. (From *hydor*, water, and *pelle*, a shield; referring to the floating shield-like leaves. Nat. ord., *Nymphaeaceæ*; Tribe, *Cabombeeæ*.) See **Brasenia**.

- H. purpurea*. B. M. t. 1147. See *Brasenia peltata*.

Hydrophyllum. Water-leaf. (From *hydor*, water, and *phyllon*, a leaf. Nat. ord., *Hydrophyllaceæ*.)

Hardy herbaceous perennials, from North America. Divisions and suckers; rich loam and peat; in marshy situations.

- H. appendiculatum*. ¾. Blue. May. 1812. Syn., *Nemophila paniculata*.

- *canadense*. ¾. White. May. 1759. B. R. t. 242.

- *magellanicum*. See *Phacelia circinata*.

- *virginicum*. ¾. Blue. June. 1739. B. R. t. 331.

Hydrosme. (From *hydra*, a water serpent, and *osme*, smell; referring to the odour of the flower at the time of fecundation. Nat. ord., *Aroideæ*.)

Stove tuberous-rooted aroids.

- H. Leopoldiana*. 2. Spathe velvety purple-brown. Congo. G. C. 1887, i. p. 642.

- *Ten'szii*. W. Tropical Africa. Gf. t. 1142.

Hydrotaenia. (From *hydor*, water, and *tainia*, a band; referring to a triangular band in the flower secreting a liquid. Nat. ord., *Irideæ*; Tribe, *Morvææ*.) See **Tigridia**.

Hygrometer. An instrument for ascertaining the quantity of moisture in the air. Everything that swells by moisture, and contracts by dryness, is capable of being formed into one. Every gardener, who has taken a cool bunch of grapes into a hothouse well supplied with moisture, would, in the grapes almost instantly being covered with dew, see the principle upon which the hygrometer acts. The colder the grapes, the warmer the house, the more the vapour contained in it, the sooner would the dew be formed, and the more plentiful its deposite. Pouring cold water into a glass tumbler, in similar circumstances, will be attended with a similar result: dew will be deposited on the outside of the glass; because, in either case, the cold body condenses the vapour in its neighbourhood; and this is what is called the dew point, being that temperature at which moisture is deposited from the surrounding atmosphere upon any object of that particular temperature. The *drip* in frames, greenhouses, etc., is similarly caused. The thermometer is the best instrument for showing the temperature; and by taking two similar ones, keeping one dry and the other, covered with a fold of muslin or silk, wet, with a thread of floss-silk acting as a syphon from a vessel of water, the greater the difference of temperature indicated by the moist and dry thermometer, the greater the deficiency of atmospheric moisture. The nearer the temperature of the moist and dry bulb, the nearer is the air to being saturated with moisture. To obtain more perfect details *Daniel's Hygrometer* is the best instrument. It is represented in the following figure. It consists of two

hollow glass balls containing ether, and communicating by the glass tube which rests on the support. The ball which forms the termination of the longer leg is of black glass, in order that the forma-

tion of dew on its surface may be the more perceptible. It includes the bulb of a delicate thermometer dipping in the ether, its scale being inclosed in the tube above the ball; and whatever change takes place in the temperature of the ether is indicated by this thermometer. The other ball is covered with muslin. In making an observation it is first necessary to note down the temperature of the air; next turn the instrument, so that when the muslin-covered ball is held in the hand, the ether may escape into the blackened ball; and it should also be held till the included thermometer rises a few degrees above the temperature of the air, when it should be replaced on the support. Then drop, or gently pour, a little ether on the muslin. The evaporation of this extremely volatile substance produces cold; and attention must be instantly directed to the black glass ball and included thermometer. The latter will be seen falling rapidly; and at length a ring of dew will appear at the line which runs across the black ball—quickly, if the air is very moist, slowly, if the air is dry. If the air is very dry, no moisture will be thus deposited till the thermometer falls to 10° , 20° , or 30° below the temperature of the air. But at whatever temperature the dew forms, that temperature should be noted as the dew-point; and the difference between it and the temperature of the air, at the time, is the degree of dryness according to the indications of this hygrometer. Thus, in a moderately dry day, let it be supposed that the temperature of the air is 65° in the shade, and that the muslin requires to be kept moist, before dew is formed, till the blackened ball containing the ether has its temperature reduced to 50° , as indicated by the included thermometer, there are then said to be 15° of dryness. Again, supposing the temperature is 85° , and the dew-point found, as before, to be 70° , the degree of dryness is still expressed by 15° ; but the quantity of moisture diffused in the air is, notwithstanding, somewhat greater in the latter case than in the former. If 1,000 represent complete saturation, the quantity of moisture, when the temperature is 65° and the dew-point 50° , will be 609; but when the temperature is 85° and the dew-point 70° , the moisture will be represented by 623; these numbers being ascertained by tables prepared for the purpose. The difference, however, in such a case is so small, it is not worth taking into account in a horticultural point of view. But as these

numbers can only be ascertained by calculation, it is more convenient to reckon by the degrees of dryness, bearing in mind that the dryness of the air is indicated by the difference between the temperature of the air and of the dew-point. Thus, if the ring of dew is formed as soon as ether is applied, and only 1° difference is observable, the air is nearly saturated; if the difference is 5° to 10° the dryness is very moderate; while 15° to 20° of difference indicate excessive dryness, and beyond this the air is parching.—*Gard. Chron.*

Hygro'phila. (From *hygros*, moist, and *phileo*, to love; referring to the habitat of the plant. Nat. ord., *Acanthaceæ*; Tribe, *Ruellieæ*. Syn., *Asteracantha*.)

Stove evergreens. Cuttings of young shoots in sandy soil, in heat; peat and loam. Summer temp., 60° to 80°; winter, 45° to 55°.

H. longifolia. Purple. June. India. 1821. Syn., *Asteracantha longifolia*, Wight Ic. t. 449 and *Barleria longifolia*.

— *ringens*. 1. 1820.

— *salicifolia*. Violet. June. India. 1822. Wight Ic. t. 1490.

Hyle'sinus pini'perda. A species of beetle, which preys upon the pith of young shoots of sickly or recently-felled Scotch and spruce-firs. It is not very injurious in this country.

Hylonom'e. (Derivation not stated. Nat. ord., *Liliaceæ*—*Asparageæ*. Allied to *Polygonatum*.) Now known as **Behnia**.

A greenhouse climber with the habit of one of the *Myrsiphyllum* group of *Asparagus*; remarkable for the beautiful netted venation of the leaves when dried. Seeds, suckers. Rich light loam. Summer temp., 60° to 80°; winter, 55° to 60°.

H. reticulata. White. S. Africa. 1867. Syn., *Dictyopsis Thunbergii*.

Hyloto'nia ro'sæ. A saw-fly, which injures rose-trees seriously, by puncturing in rows their young shoots, and depositing its eggs in the holes. The best remedy is spreading a cloth beneath the trees in the evening, and killing the insects shaken down upon it.

Hymenæ'a. Locust-tree. (From *Hymen*, the god of marriage; referring to the leaflets being joined. Nat. ord., *Leguminosæ*; Tribe, *Amherstieæ*. Allied to *Saraca*.)

Fine, close-grained, hard wood; and the resins Anime and Copal are produced by these stove evergreen trees. Cuttings of firm young shoots in spring, inserted firmly in sand, covered with a bell-glass, in bottom-heat; peat and rich loam. Summer temp., 60° to 85°; winter, 55° to 80°.

H. Candolleana. 80. White. Acapulco. 1824. — *Cowbaril*. 40. Yellow, purple. W. Ind. 1688. — *verrucosa*. See *Trachylobium verrucosum*.

Hymena'ndra. (From *hymen*, a membrane, and *aner*, a man; the anthers being connected by a membrane. Nat. ord., *Myrsinaceæ*.)

Stove evergreen shrub. For cultivation, see *ARDISIA*, to which it is allied.

H. Wall'ichii. 3. Greenish. E. Indies.

Hymena'nthera. (From *hymen*, a membrane, and *anthera*, an anther, or pollen-bag. Nat. ord., *Violaceæ*; Tribe, *Alsodeieæ*. Allied to *Alsodeia*.)

Greenhouse evergreen shrub. Cuttings of young shoots, getting a little firm, in spring, in sand, over peat, and well drained, under a bell-glass; sandy peat, with a third of fibry loam. Winter temp., 40° to 45°.

H. crassifolia. 2-4. Berries white. New Zealand. 1875. G. C. 1875, iii. p. 237.

— *dentala*. 6. Yellow. May. New S. Wales. 1824. B. M. t. 3163.

Hymenoca'llis. (From *hymen*, a membrane, and *kalos*, beautiful; referring to the membranous cup inside the flower. Nat. ord., *Amaryllideæ*; Tribe, *Amarylleæ*. Allied to *Pancreatum*.)

They have all white flowers, and much resemble *Pancreatiums*. Their seeds differ in being large and green, the seeds of *Pancreatum* having a black, brittle skin. Offsets; rich, sandy loam. See *AMARYLLIS*.

Hymenodictyon. (From *hymen*, a membrane, and *diktton*, a net; the envelope of the seeds being a net-like membrane. Nat. ord., *Rubiaceae*; Tribe, *Cinchonae*. Allied to *Bouvardia*.)

Stove evergreen trees, from the East Indies, with greenish-yellow flowers. For culture, see CINCHONA.

- H. excelsum*. 30. July. 1820. Wight Ic. t. 79.
 — *thyrsiflorum*. 15. June. Bengal. 1819.

Hymenodium. (From *hymen*, a membrane; alluding to the membranous fronds. Nat. ord., *Filices* — *Polypodiaceae*.)

Stove fern. See FERNS.

- H. crinitum*. 1. W. Indies.

Hymenolepis. (From *hymen*, a membrane, and *lepis*, a scale; alluding to the scales of the sporangiferous receptacles. Nat. ord., *Filices* — *Polypodiaceae*.)

Stove fern. See FERNS.

- H. spicata*. Malay Archipelago.

Hymenophyllum. Filmy-leaf Fern. (From *hymen*, a membrane, and *phylon*, a leaf. Nat. ord., *Filices*.)

Ferns, all with brownish-yellow spores, except where otherwise mentioned. By spores, and dividing the roots; peat and loam; should be rather cramped for room. See FERNS.

Hyoscyamus. Henbane. (From *hyos*, a hog, and *kyamos*, a bean; fruit eaten by swine. Nat. ord., *Solanaceae*; Tribe, *Hyoscyameae*. Allied to *Datura*.)

The annual, *H. Cameraarii*, by seed in the open border, towards the end of March; the shrubby kinds, by cuttings under a bell-glass, in April; or under a hand-light in a shady place, in summer. Sandy, fibry loam, and a little leaf-mould; when planted out of doors, young plants must be reared for saving through the winter in a cold pit or greenhouse. There are many other species besides the following; but they are mere weeds.

- H. aureus*. Yellow, purple. Crete. B. M. t. 87.

Hyospathe. (From *hyos*, a hog,

and spathe, a spathe. Nat. ord., *Palmeæ*.)

Stove palm. For culture, see BACTRIS.

H. elegans. Green. Fruit violet. Para.

Hype'coum. (From *hypecheo*, to rattle; referring to the seeds in the pods. Nat. ord., *Papaveraceæ*; Tribe, *Fumariceæ*.)

Hardy annuals, with yellow flowers. Seeds in the open border, in March and April.

H. erectum. $\frac{1}{2}$. May. Siberia. 1759.

H. grandiflorum. 1. Yellow. Pyrenees. Gfl. t. 1060.

H. littoralis. $\frac{1}{2}$. Yellow. S. Europe. Jacq. Ic. t. 309.

H. pedunculatum. $\frac{1}{2}$. June. South France. 1640.

H. procumbens. 1. July. South Europe. 1596. Swt. Fl. Gard. t. 217.

Hypernera *tharita* *Moringa*. See *Moringa pterygosperma*.

Hype'ricum. St. John's Wort. (The *Yperikon* of Dioscorides; said to be from *yper*, on account of, and *ereike*, heath; from its growing in similar places. Nat. ord., *Hypericineæ*; Tribe, *Hypericeæ*.)

All yellow-flowered, except where otherwise mentioned. The hardier ones flourish in common and sandy loam, and the more tender in loam and peat. Annuals, sow in the open border, in March; herbaceous, sow, and divide the plants in spring; shrubs are easily divided, as they produce runners freely, and also by seeds; greenhouse and frame kinds, by divisions, but chiefly by cuttings of young shoots in sand, under glass; most of them, if protected in winter, would grow against a wall. For exposed places the following are the best shrubby ones: *elatior*, *hirtum*, *calycinum*, *Kalmia num*, and *prolificum*.

HARDY BIENNIAL.

H. simplex. 1. July. N. Amer. 1826.

GREENHOUSE EVERGREEN SHRUBS, ETC.

H. aegyptiacum. 2. June. Egypt. 1787. B. R. t. 196.

H. aethiopicum. 1. July. Cape of Good Hope. 1817.

H. baleaticum. $1\frac{1}{2}$. May. Majorca. 1774. B. M. t. 137.

H. canariense. 2. August. Canaries. 1699. B. C. t. 953.

H. chinense. 8. June. China. 1753.

H. cochinchinense. 3. Red. July. China. 1821.

H. cordifolium. 2. Nepaul. 1825. Half-hardy.

H. cris. 1. June. Levant. 1640. Half-hardy. B. M. t. 178.

H. empetrifolium. 1. July. South Europe. 1820. Half-hardy. B. M. t. 6764.

H. erioides. 1. June. Spain. 1821. Half-hardy.

H. floribundum. 3. June. Madeira. 1779. Deciduous.

H. foliosum. 3. August. Azores. 1778. Jacq. H. Schoenb. t. 299.

H. glandulosum. 2. June. Madeira. 1777.

H. grandiflorum. 3. July. Teneriffe. 1718.

H. heterophyllum. 2. July. Persia. 1812.

H. monogynum. Yellow. China. 1753. B. M. t. 334.

H. oblongifolium. 1. June. Nepaul. 1823.

H. sinense. Deep yellow. 1883.

H. triflorum. Golden-yellow. India and Java. 1884. Hardy in South Ireland.

HARDY DECIDUOUS AND EVERGREEN SHRUBS.

H. axillare. 2. July. Georgia. Evergreen.

H. buckleyi. Bright yellow. N. Carolina. G. and F. iv. p. 581, fig. 91.

H. calycinum. 1. July. Ireland. B. M. t. 146.

H. densiflorum. United States. G. and F. iii. p. 524, fig. 67.

H. elatum. 5. July. N. Amer. 1762. Wats. Dendr. t. 85.

H. fasciculatum. 1. July. Carolina. 1811.

H. frondosum. 5. July. N. Amer. 1806.

H. galioides. 2. August. N. Amer. Evergreen.

H. Gebleri. July. Altai. 1829.

- H. virga'tum*. 1½. July. N. Amer. 1820.
— *virg'nicum*. 1½. August. N. Amer. 1800.
Andr. Rep. t. 552.

Hyphæ'ne. (From *hyphaino*, to entwine; referring to the fibres of the fruit. Nat. ord., *Palmeæ*; Tribe, *Borasseæ*. Allied to *Latania*.)

This is the Doum Palm, and the Gingerbread-tree of Egypt, the bark having the appearance of that eake. Stove palm. Seeds; rich, sandy loam.

- H. coria'cea*. 20. Egypt. 1824.
— *Petersia'na*. Mozambique. 1848.
— *theba'ica*. 40. Egypt. 1828. Fl. Ser. t. 2152-3. Doum Palm.

Hypocaly'mma. (From *hyppo*, under, and *kalymma*, a veil; referring to the calyx falling off like a veil or cape, on account of the cohesion of the points, or apices. Nat. ord., *Myrtaceæ*; Tribe, *Leptospermeæ*.)

Greenhouse evergreen shrubs, from Australia. Cuttings of young shoots in sand, under a bell-glass; loam and peat, with a little silver sand and pieces of charcoal.

- H. angustifolium*. 2. White. May. 1843.
B. R. 1843, t. 8. Syn., *H. suave*.
— *robustum*. 1. Rose. May. 1843.
— *sua've*. See *H. angustifolium*.

Hypocaly'ptus. (From *hyppo*, under, and *kalypto*, to veil; referring to the two bractlets under the flower. Nat. ord., *Leguminosæ*; Tribe, *Genisteæ*. Allied to *Loddigesia*.)

A very old evergreen greenhouse plant, once called a *Crotalaria*, and one of the best of that section. Cuttings of young side-shoots in April, in sand, under a bell-glass; peat and loam.

- H. obcordatus*. 1½. Purple. June. Cape of Good Hope. 1823. B. M. t. 3394. Syn., *Crotalaria cordifolia*, *C. elegans*, and *C. purpurea*. B. M. t. 1913, and B. R. t. 128.

Hypochæ'ris. (Derivation doubtful. Nat. ord., *Compositæ*; Tribe, *Cichoraceæ*.)

Hardy perennial herb.

- H. maculata*. Yellow. July. Europe, rare in Britain.

Hypocy'rtia. (From *hyppo*, below, and *kyrtos*, curved; alluding to the flowers being swollen on the under side. Nat. ord., *Gesneraceæ*; Tribe, *Cyrtandree*.)

Stove plants. For cultivation, see *GESNERA*.

- H. brevicalyx*. See *Isoloma hypocyrtiflora*.
— *discolor*. See *Altoplectus dichrus*.

— *rugulosa*. September. Van Diemen's Land. 1844.
— *tenuifolia*. June. N.S. Wales. 1824.

Hypoly'tron. (From *hyppo*, beneath, and *elytron*, a sheath. Nat. ord., *Cyperaceæ*.)

Stove perennial grass-like herb, suitable for table decoration, etc. Seeds; divisions. Sandy loam and peat; requires shade and plenty of water.

- H. latifolium*. 2-4. Brown. Ceylon. 1877. B. M. t. 6282.

Hypophyllanthus Lindeni. See *Erythrochiton Hypophyllanthus*.

Hypo'xis. (From *hyppo*, beneath, and *oxys*, sharp; referring to the seed-pod. Nat. ord., *Amaryllidææ*; Tribe, *Hypoxidææ*.)

Very pretty little bulbs, from South Africa, and with yellow flowers, except where otherwise mentioned. They are little known to gardeners. Division of the plant in spring, and division of the roots; peat and loam. Temperature, according as the species is hardy, or requiring the greenhouse or stove.

HARDY.

Hyssopus. Hyssop. (*Yssopus* of Dioscorides, but certainly not the same plant. Nat. ord., *Labiatae*; Tribe, *Satureiinae*.)

Hardy, blue-flowered evergreens. Sow in March or April; propagate by dividing the plant at the same time, or in September; also, by stout cuttings at a similar period; the varieties are propagated by cuttings, and require a hand-light over them; dry, light soil. The plant is not only aromatic, but the flowers are beautiful.

I.

Ia'nthe. See **Celsia**.

Ibbetsonia. (In honour of Mrs. Agnes Ibbetson, a writer on Vegetable Physiology. Nat. ord., *Leguminosae*; Tribe, *Sophoraceae*.) United with **Cyclopia**.

- I. genistoides*. B. M. t. 1259. A synonym of *Cyclopia genistoides*.

Iberide'lla. (Diminutive of *Iberis*. Nat. ord., *Cruciferae*; Tribe, *Thlaspidaceae*.)

Hardy perennial alpine herb. For cultivation,

see **HUTCHINSONIA**, in which it was formerly included.

- I. rotundifolia*. 1-1. Rosy-lilac, yellow. April. Alps. 1868. B. M. t. 5749. Syn., *Hutchinsonia rotundifolia*.

Ibe'ris. Candy Tuft. (From *Iberia*, the ancient name of Spain, where the species abounds. Nat. ord., *Cruciferae*; Tribe, *Thlaspidaceae*. Allied to *Thlaspi*.)

All white-flowered, except where otherwise specified. Annuals and biennials, by seeds in March and April; most of the annuals, and especially the *umbellata* group, are very hardy, and if sown in autumn will generally stand the winter, and bloom in April and May in consequence. The shrubby evergreen group, by seeds, but chiefly by cuttings after flowering, under a hand-light, in a shady corner, in summer. *I. sempervirens* may be taken as a type of this group, and whether in a clump, by the side of borders, or hanging over knolls and rock-works, its masses of white flowers are really beautiful.

HARDY ANNUALS AND BIENNIALS.

- I. amara*. 1-1. White. June. W. Europe. Common Candy Tuft. Annual.

Iceaci'na. (A name given on account of the resemblance of the branches to a tree called the *Iceaco*. Nat. ord., *Oleaceae*; Tribe, *Iceacinae*.)

Stove perennial, with a large tuberous root-stock and slender climbing stems. Cuttings of the young shoots in sandy loam, in bottom-heat, under a hand-glass. Rich sandy loam and leaf-mould.

- I. Ma'nni*. Yellow. October. Old Calabar. 1865. B. M. t. 6260.

Iceco'rea *guianensis*. A synonym of *Ardisia acuminata*.

Ice. Mr. Beaton finds that the cheapest and most effectual mode of preserving this is in what he terms an *Iceberg*, and it is thus constructed:—Choose a natural hollow for the sight of the iceberg, where the bank on one side is steep, and let the outside of the cone, when it is finished, be at six feet from the bottom of the bank. Some such space is necessary between the bank and the ice, to get rid of any rain or snow water that may run down the bank before it gets to the ice. At the bottom of the bank, and half way up, pots are to be let into the ground in pairs, four feet apart, and braced together with a strong piece of timber set across, as builders do their scaffolding; let planks for wheeling on be made into a long trough, inclining from the top of the bank, and resting on those cross pieces; the bottom of the trough being carried out to near the intended centre of the cone, and far above it; and the ice should be broken on a platform of boards at the top of the bank, and poured down the inclined trough. The broken ice should be spread a little by some one as it falls from the spout, care being taken that the cone is brought up regularly; and when the ice reaches the height of the bottom of the spout, the planks are to be re-arranged, so as to allow room for throwing off the ice as fast as it comes down; and, finally, when the cone is finished into a sharp point, the whole must be left till the *first frost* after mild or thawing weather. The outside of the iceberg has then melted a little; but on the first hard frosty night the whole is frozen over again, and the outside of the cone is then as if it were one solid face of rugged ice; and now is the time to thatch it entirely over with good long straw, about the same thickness as you would a wheat or barley stack, and no more, *provided* you have cheaper materials to give it a good thick covering afterwards. At Shrubland Park they use large quantities of leaves, and nothing else, over the straw; these are thrown on at intervals, so that the leaves do not heat by putting too many on at once. The depth of covering over the straw is sometimes twice as much as in other seasons, according to the quantity of leaves on hand; but two feet in thickness does not preserve the ice better than one foot. The ice is never uncovered by high winds blowing

off the leaves, though nothing is put upon them to keep them down.

Perfect exemption from wet or damp is necessary for the bottom of an iceberg; and a few pieces of rough wood, put upon such a place, and covered with brushwood about a foot, and that again covered with six inches of straw, is sufficient. The brushwood and straw are soon compressed into a few inches by the weight of the ice; and as the ice melts, the water passes through, without hinderance, into cross open drains at the bottom. When ice is required, the thatch is opened at the bottom, each time, the ice cut out with a pickaxe, and the thatch replaced.

If an *Ice-house* is built, Mr. Cobbett's plan, as follows, is the best:—Fig. 1 *a* is the centre of a circle, the diameter of which is ten feet, and at this centre you put up a post to stand fifteen feet above the level of the ground, which post ought to be about ten inches through at the bottom, and not much smaller at the top. Great care must be taken that this post be perfectly perpendicular, for if not, the whole building will be awry; *bb* are fifteen posts, nine feet high, and six inches through at the bottom, without much tapering towards the top. These posts stand about two feet apart, reckoning from centre of post to centre of post, which leaves between each two a space of eighteen inches; *ccc* are fifty-four posts, five feet high, and five inches through at the bottom, without much tapering towards the top. These posts stand about two feet apart from centre of post to centre of post, which leaves between each two a space of nineteen inches. The space between these two rows of posts is about four feet in width, and is to contain a wall of straw; *e* is a passage through this wall; *d* is the outside door of the passage; *f* is the inside door; and the inner circle, of which *a* is the centre, is the place in which the ice is to be deposited. The wall is to be made of straw, wheat straw, or rye straw, with no rubbish in it, and made very smooth by the hand as it is put in. Lay it in very closely and very smoothly, so that if the wall were cut across, as at *gg* in Fig. 2 (which Fig. 2 represents the whole building cut down through the middle, omitting the centre post), the ends of the straw would present a compact wall. It requires something to keep the straw from *bulging* out between

Fig. 1.

the posts; little stakes as big as your wrist will answer this purpose. Drive them into the ground, and fasten at the top to the plates, which are pieces of wood that go all round both the circles, and are nailed upon the tops of the posts. Their main business is to receive and sustain the lower ends of the rafters, as at *mm* and *nn* in Fig. 2. From *s* to *m* there need be only about half as many as from *m* to *n*. The roof is forty-five degrees pitch, as the carpenters call it. If it were even sharper it would be none the worse. There will be about thirty ends of rafters to lodge on the plate as at *m*, and these cannot all be fastened to the top of the centre post rising up from *a*. The plate which goes along on the tops of the row of posts, *bbb*, must be put on in a somewhat sloping form, otherwise there would be a sort of hip formed by the rafters. The best way to put on such deep thatch is to have a strong man to tie for the thatcher. The thatch is to be of clean, sound, and well-prepared wheat or rye straw, four feet

Fig. 2.

thick, as at *hh* in Fig. 2. The bed for the ice is the circle of which *a* is the centre. Begin by laying on the ground round logs, eight inches through or thereabouts, and placing them across the area, leaving spaces between them of about a foot. Then, crossways on these, poles about four inches through, placed at six inches apart. Then, crossways on them, rods as thick as your finger, placed at an inch apart. Then, again, small, clean, dry, last winter-cut twigs, to the thickness of about two inches, or, instead of these twigs, good, clean, strong rushes, free from grass and moss, and from rubbish of all sorts. Upon this bed the ice is put, broken, and beaten down together in the usual manner. As we have seen, there is a passage, *e*; two feet wide is enough for this passage, so that you may have two doors, and the inner door open. This inner door may be of hurdle-work and straw, and covered on one of the sides with sheep-skins with the wool on, so as to keep out the external air. The outer door, which must lock, must be of wood,

made to shut very closely, and covered, besides, with skins like the other. At times of great danger from heat or from

Fig. 3.

wet, the whole of the passage may be filled with straw. The door, Fig. 3, should face the north, or between north and east. As to the size of the ice-house, that must of course depend upon the quantity of ice that you may choose to have. A cubic foot of ice will, when broken up, fill much more than a Winchester bushel.

Ice-plant. *Mesembrya'nthemum crystallinum.*

Ichneumon Flies are of interest to the gardener, from the fact that they keep down the number of many other kinds of insects by laying their eggs either in their chrysalids or caterpillars, which become destroyed by the fly maggots when hatched. This is especially the case with one species—*Microgaster glomeratus*—which lays its eggs in the caterpillar of the Large White Cabbage Butterfly. The cocoons, which are small and bright yellow, are often seen upon cabbages, and should not be destroyed. The flies have long, slender bodies, four small wings, and two long vibratile antennæ.

Ichnocarpus. (From *ichnos*, a vestige, and *karpos*, a fruit; in reference to the slender seed-vessels. Nat. ord., *Apocynaceæ*; Tribe, *Echitidææ*. Allied to *Apocynum*. Syn., *Aganosma*.)

Stove evergreen twiners. Cuttings of small side-shoots in April in sand, and in heat.

I. acuminatus. White. Sylhet. Syn., *Aganosma acuminata*. Wight Ic. t. 42a.

— *caryophyllatus*. Pale yellow. October. E. Ind. 1812. Syn., *Aganosma caryophyllata*.

I'cica. (The native name in Guiana. Nat. ord., *Burseraceæ*; Tribe, *Burserææ*.)

Allied to *Bursera*, with which it is united by Bentham and Hooker.)

Stove evergreen balsam producing trees with white flowers, and all but one natives of Guiana. Cuttings of ripened young shoots in strong heat, in sand, and under a bell-glass; fibry peat and loam.

- I. altissima*. See *Protium altissimum*.
 — *deca'ndra*. 40. 1825. Syn., *Leicopsis caudata*.
 — *ennea'ndra*. See *Protium Schomburgkianum*.
 — *guianensis*. See *Protium guianense*.
 — *heterophylla*. See *Protium Araconchini*.
 — *Tacamaha'ca*. See *Protium heptaphyllum*.

Ide'sia. (Named after the Dutch traveller *Ysbrants Ides*, who made explorations in China. Nat. ord., *Bixineæ*.)

An ornamental hardy tree, with terminal panicles of inconspicuous flowers, followed by blue-black berries. Seeds sown in spring in a slight heat germinate readily; by cuttings it is more difficult to propagate; they should be taken from the half-ripened shoots in spring or autumn, and inserted in sandy loam, and placed in a slight bottom-heat under a bell-glass.

- I. polycarpa*. China. B. M. t. 6794. Syn., *Placourtia japonica* and *Polycarpa Maximowiczii*.

Ilex. The Holly. (From the resemblance of the leaves to the *Ilex* of Virgil, *Quercus ilex*. Nat. ord., *Illicineæ*.)

All white-flowered but one. By seed, which should be kept in the rot-heap for twelve months after gathering, frequently turned in the mean time, to rot the pulp, and then sown in beds. The varieties by grafting and budding—the first in March, and the second in July; by cuttings of the ripened summer shoots in autumn, on a north border, and covered with hand-glasses; soil, sandy loam, in any place free from stagnant water. See HOLLY.

HARDY DECIDUOUS.

- I. decidua*. 4. June. S. United States. 1736. Syn., *Prinos deciduus*.

Illai'rea. (Commemorative of *M. Illaire*. Nat. ord., *Loasaceæ*.) United with *LOSA* by Bentham and Hooker.

Half-hardy climbing annual, with stinging hairs. For cultivation, see *LOSA*.

- I. canarinoides*. Red. July. Central America. 1855. B. M. t. 5022.

Illece'brum. Knot Grass. (From *illecebra*, a charmer; referring to the pretty little annuals giving a charm to waste places. Nat. ord., *Illecebraceæ*.)

All white-flowered, and all propagated by seed; common soil, though *verticillatum* likes a little moist peat. The greenhouse and stove perennials merely require the extra heat, and may also be propagated by division in the spring.

- I. diffusum*. 1. June. Trinidad. 1817. Greenhouse herbaceous perennial.
 — *glomeratum*. †. June. Brazil. 1820. Stove herbaceous perennial.
 — *gompfrenoides*. †. June. Peru. 1810. Stove annual.
 — *verticillatum*. †. July. England. Hardy trailing annual. Eng. Bot. ed. 3. t. 1173.

Illi'cium. (From *illicio*, to allure; referring to the perfume. Nat. ord., *Magnoliaceæ*; Tribe, *Winteraceæ*. Allied to *Drimys*.)

The fruit of *anisa'tum* has the flavour of anise, being used as a spice in Chinese cookery; and the seed of *religi'osum* is burnt as incense in their temples. Half-hardy evergreen shrubs. Cuttings of the young ripened shoots in sand, under a glass, in summer; by layers, from a stool in a cold pit, where they generally remain two years before being removed; sandy loam and peat; require the protection of the cold pit or greenhouse in winter, though *florida'num* has stood out in many places with but a slight protection in severe weather.

- I. anisa'tum*. 6. Red. May. Japan. 1790.
 — *variegat'um*. Japan. 1861.
— florida'num. 8. Red. May. Florida. 1766.
 B. M. t. 439.
— parviflor'um. 6. Yellow. May. Florida. 1790.
— religi'osum. 4. Yellow, green. March. Japan. 1842. B. M. t. 3965.
— ve'rum. Greenish, tinged with pink. S. China. 1588. B. M. t. 7005. True Star Anise of China.

Illupie-tree. *Ba'ssia*.

Imantophyllum. (From *imas*, a leather thong, and *phyllon*, a leaf; alluding to the shape and substance of the foliage. Nat. ord., *Amaryllidææ*; Tribe, *Amaryllææ*.) See **Clivia**.

- I. Ait'ni*. B. M. t. 2856. See *Clivia nobilis*.
— atrosanguineum. A variety of *Cliviaminiata*.
— cyrtanthiflor'um. Fl. Ser. t. 1877. See *Clivia cyrtanthiflora*.
— Gard'ni. A synonym of *Clivia Gardeni*.
— miniata. B. M. t. 4783. See *Clivia miniata*.

Imbricaria. (From *imbrico*, to cover like tiles on a roof; referring to the divisions of the calyx. Nat. ord., *Sapotaceæ*. Allied to *Mimusops*.)

Stove trees, which produce fruit similar to an orange. Cuttings of ripe shoots in sand, under a glass, in strong, moist heat; sandy loam and peat.

- I. borbonica*. White. Isle of Bourbon. 1820.

Imbricated. Leaves, sepals, etc., are said to be imbricated when one laps over the next, and so in succession, like the tiles of a house, as in the leaves of the common Heath, or Ling, *Eri'ca vulg'aris*, or the scales of a pine cone.

Impatiens. Balsam. (From *impatiens*; referring to the elasticity of the valves of the seed-pod, which discharge the seeds when ripe, or when touched. Nat. ord., *Geraniaceæ*; Tribe, *Balsamineæ*.)

Hardy annuals and biennials, by seed in the open border, in April. *Scapiflora*, a bulb, requires stove heat, and to be kept almost dry in winter. Greenhouse annuals and biennials merely require to be sown in a hotbed in March, and planted out as half-hardy and tender annuals. All these may be kept over the winter by taking off cuttings in the beginning of autumn, which would bloom in the house early in the spring. See BALSAMS.

Culture.—The chief object in cultivating these is their fine, large, double, flowers; and, to secure this object, seed

should be saved only from the finest plants.

To have them very fine, the seed should be sown in a sweet hotbed, in the middle of March; the plants pricked out into small pots when three inches in height, using light, rich soil, shifting them again, and successively, never allowing them to be pot-bound, and plunging the pots into a medium temperature of 75°, until some time after their last shifting into eight or twelve-inch pots, according as you aim at moderate-sized or very large specimens. Allow, all the time, a current of air, more or less according to the weather, to keep the plants bushy, and using richer materials every time of potting, until the last soil used may consist of nearly as much very rotten, but sweet dung (cow-dung is best), as turfy, sandy loam.

Successions may be sown in April and May, and treated in a similar manner, either for pots, or to be turned into beds, where they frequently do well until the middle of October.

When you cannot accommodate any but the best flowers in the greenhouse, adopt the following method:—After pricking out into three or four-inch pots, and plunging them in the bed, allow the pots to get full of roots, keep them drier and cooler, and give plenty of air, which will soon cause flowers to appear; then select plants with the best flowers, rub every flower-bud off them, fresh pot, disentangling the roots a little as you proceed, and grow them on as advised above; and what you lose in time you will make up in selectness.

Impatient. A plant is said to be impatient of heat or cold when it is speedily injured by a slight excess of either one or the other.

Impregnation. No seed ever attains the power of germinating, unless the pollen from the stamens in the same, or some nearly allied flower, has reached and impregnated its pistils. In favourable seasons, when genial warmth and gentle winds prevail, impregnation is readily effected by the plant's own provision. The pollen is never shed from the anther of the stamen until the stigma of the pistil is fully developed, and this soon withers after the contact.

Insects aid in effecting this impregnation, and, in frames, hothouses, etc., from whence they are almost totally excluded, other artificial means might be adopted with success to render flowers fertile that had hitherto failed in producing seed. Thus the gardener always

finds the advantage of using the camel-hair-pencil to apply pollen to the stigmas of his forced melons, cherries, and peaches. See **Hybridizing**.

Inarching, or Grafting by approach, differs from grafting only in having the scion still attached to its parent stem whilst the process of union with the stock is proceeding. It is the most certain mode of multiplying an individual that roots or grafts with difficulty, but is attended with the inconvenience that both the stock and the parent of the scion must be neighbours.

Having the stocks properly placed, make the most convenient branches approach the stock, and mark in the body of the branches the parts where they will most easily join to the stock, and in those parts of each branch, pare away the bark and part of the wood two or three inches in length, and in the same manner pare the stock in the proper place for the junction of the graft; then make a slit upward in the branch so as to form a sort of tongue, and make a slit downward in the stock to admit it; let the parts be then joined, slipping the tongue of the graft into the slit of the stock, making the whole join in an exact manner, and tie them closely together with bass, and afterwards cover the whole with a due quantity of clay, or wax. After this, let a stout stake be fixed for the support of each graft, and so fastened as to prevent its being disjoined from the stock by the wind.

The operation being performed in spring, let the grafts remain in that position about four months, when they will be united, and they may then be separated from the mother-tree. In doing this be careful to perform it with a steady hand, so as not to loosen or break out the graft, sloping it off downwards close to the stock; and the head of the stock cut down close to the graft, and all the old clay and bandage cleared away and replaced with new, to remain a few weeks longer. Observe, however, that if the grafts are not firmly united with the stock, let them remain another year till autumn, before you separate the grafts from the parent tree. Instead of approach-grafting in the usual manner, it is sometimes convenient to detach shoots of the kinds to be propagated from the plants on which they grew, and inarch them upon the single plant, leaving a piece at the bottom of each shoot sufficiently long to thrust into a phial, which must be kept constantly supplied with water.

Incarvillea. (In honour of *P. Incarville*, a Chinese Jesuit, who lived in the middle of the eighteenth century. Nat. ord., *Bignoniaceæ*; Tribe, *Tecomanæ*.)

Hardy perennials, except *I. sinensis*, requiring light rich soil. Seeds; division of roots.

- I. arguta.* A synonym of *Amphicome arguta*.
- *compacta.* Rose-purple. Summer. N.W. China. 1880. Gt. t. 1068.
- *grandiflora.* See *Tecoma grandiflora*.
- *Koopmanni.* 3. Purplish, pink, white. September. Central Asia. 1880.
- *O'lgæ.* 3-4½. Purple. Turkestan. 1880.
- *sinensis.* 1-2. Scarlet. China. Greenhouse.
- *tomentosa.* See *Paulownia imperialis*.

Indehiscent. A term used to denote those fruits which do not open regularly when ripe, e.g., apple, cherry, etc.

Indian Bay. *Laurus indica.*

Indian Blue. *Nymphæa cyanea.*

Indian Cress. (*Tropæolum*.) See **Nasturtium.**

Indian Fig. *Opuntia.*

Indian Grass. *Ariundo.*

Indian Hawthorn. *Raphiolepis.*

Indian Hemp. *Apocynum cannabinum.*

Indian Lotus. *Nymphæa lotus.*

Indian Mulberry. *Morinda.*

Indian Physic. *Magnolia auriculata.*

Indian Pink. *Didymus chinensis.*

Indian Shot. *Canna indica.*

Indigenous. Native, or naturally produced. Thus, the Crab-tree is indigenous to England.

Indigofera. (From *indigo*, a blue dye, and *fero*, to bear. Nat. ord., *Leguminosæ*; Tribe, *Galegeæ*.)

Annals and biennials, in hotbed, in spring, potted and treated as tender and half-hardy annuals; shrubby plants, by cutting of young shoots, getting firm, in summer, in sand, under a bell-glass, and a little bottom-heat, especially the tropical species; sandy loam and peat, equal parts. Red spider is their chief enemy.

Inga. (The name in South America. Nat. ord., *Leguminosæ*; Tribe, *Ingeæ*. Allied to *Acacia*.)

Stove evergreens. Cuttings of young shoots, getting firm, in spring and summer, in sandy peat, under a bell-glass, and in bottom-heat; peat and loam. Summer temp., 60° to 85°; winter, 45° to 55°. *Pulcherrima* has large clusters of long crimson stamens. To succeed well with it, and in a small plant, give it a fair heat in summer, and plenty of moisture; but keep it cool and rather dry for several months in winter.

I. affinis. 20. Pink. Brazil. 1800.

— *melifera*. White. Arabia. 1826.

— *microphylla*. See *Pithecolobium microphyllum*.

— *pulcherrima*. 20. Mexico. 1822.

— *purpurea*. 6. Purple. April. W. Ind. 1733.

Soldier wood. A synonym of *Calliandra purpurea*.

— *Sa'man*. See *Pithecolobium Saman*.

— *setifera*. 20. Pink. Guiana. 1824.

— *splendens*. White. March. Caraccas. 1825.

— *stipularis*. Cayenne. 1831.

— *tergina*. 20. Pink. W. Ind. 1820. A

synonym of *Calliandra tergemina*.

— *velutina*. 30. Para. 1820.

Inocarpus. Otaheite Chestnut. (From *is*, a fibre, and *karpos*, a fruit. Nat. ord., *Leguminosæ*.)

The kernels are roasted and eaten in the islands as we use chestnuts. Stove evergreen tree. Cuttings of the ripened shoots in sand, and in heat; peat and loam.

I. e'dulis. 20. White. July. South Sea Islands. 1793.

Inoculation. Same as *Budding*.

Inoculating Grass. See *Turf*.

Intermediate. A *species* is often named intermediate, because possessing the different characteristics of two others.

A *hothouse* is intermediate when kept at a temperature higher than that usual in a greenhouse, and lower than that usual in a stove.

Inula. (A word of doubtful origin, said to be a corruption of *helenium*. Nat. ord., *Compositæ*; Tribe, *Inuloidæ*.)

Inula hel'num or Elecampane, furnishes the *Vin d'Aunee* of the French. Hardy herbaceous

perennials, with yellow flowers. The annuals not being worth cultivating, are omitted. Seeds, or divisions of the roots; common garden-soil. They are interesting, though rather rough-looking.

I. calyc'na. 1½. July. Sicily. 1827.

— *molis*. 2. July.

— *montana*. 1½. August. South Europe. 1759.

— *o'culus Christi*. 1½. July. Austria. 1759.

— *odorata*. See *Pulicaria odora*.

— *quadridentata*. 1. August. Spain. 1820.

— *saccharifolia*. See *Jasomia glutinosa*.

— *scabra*. A synonym of *Heterotheca scabra*.

— *suaveolens*. 1½. July. South Europe. 1758.

— *triloba*. July. Sinaï. 1837.

— *Vaillanti*. 2. September. France. 1739.

— *verbascifolia*. 1½. July. Caucasus. 1819.

— *viscosa*. 1½. July. South Europe. 1596.

Io'chroma. (From *ion*, violet, and *chroma*, colour; referring to the purple colour of the flowers. Nat. ord., *Solanaceæ*; Tribe, *Solanææ*. Allied to *Hebecladus*.)

Greenhouse shrubs. Cuttings of young shoots, getting a little firm, in sandy soil, with a bell-glass in summer; sandy peat and fibry loam. Winter temp., 40° to 45°.

I. calyc'num. Green. Guiana.

— *coccineum*. Scarlet. S. America.

— *fuchsio'ides*. 5. Orange-scarlet. Summer.

Andes of Quito. 1843. Syn., *Lycium*

fuchsioides. B. M. t. 4149.

— *gesnerio'ides*. 4. Scarlet. Peru. Gf. t. 358.

Syn., *Lycium gesneroides*.

— *grandiflorum*. Saragina.

— *lanco'la tum*. 5. Purplish-brown. July.

Quindiu. 1846. Syn., *Chenestes lanceo-*

lata. B. M. t. 4338.

— *tubulosum*. Purple. August. Yangana.

IONE. This genus does not differ from *Bulbophyllum*, under which the species will be found.

Ioni'dium. (From *ion*, violet, and *eidos*, resembling. Nat. ord., *Violaceæ*. Allied to our Violets.)

The South American species possess much of the qualities of, and are substituted for, *Ipecacuanha*. Herbaceous plants, flowering in June, by division and seed; under-shrubs, hy cuttings in sand, under a bell-glass; peat and loam. All the following require greenhouse culture, except *strictum*, which is a stove plant.

I. cape'ns. 1. White. Cape of Good Hope. 1824.

— *longifolium*. See *Noisettia longifolia*.

— *polygalæfolium*. 1. Green, yellow. S. Amer. 1797.

— *Sprengelia'num*. 1. White. Pennsylvania. 1818.

— *strictum*. ½. White. W. Ind. 1824.

Iono'psis. (From *ion*, violet, and *opsis*, like. Nat. ord., *Orchidææ*; Tribe, *Vandææ-Oncidiææ*. Allied to *Burlingtonia*.)

- Stove orchids. For culture, see BURLINGTONIA.
I. paniculata. White, violet. Brazil. 1865.
 B. M. t. 5541.
 — *pulchella*. Violet. July. Merida.
 — *tenera*. White, lilac. W. Indies. B. R.
 t. 1904.
 — *utricularioides*. $\frac{1}{2}$. White, purple. October.
 Trinidad. 1822.

Ipecacuanha. *Cephaelis ipecacuanha*, the roots of which yield an emetic.

Iphigenia. (After *Iphigenia*, daughter of Agamemnon. Nat. ord., *Liliaceæ*; Tribe, *Anguillaricæ*.)

Herbaceous plant, requiring a little protection in winter. Propagated by division of the roots.
I. indica. 1. Dark purple. June. India. 1818.
 Syn., *Anguillaria indica*.

Ipomoea. (From *ips*, bindweed, and *homotos*, similar. Nat. ord., *Convolvulaceæ*; Tribe, *Convolvuleæ*. Syns., *Batatas*, *Calonyction*, *Exogonium*, *Quamoclit*, *Macrostema*, and *Pharbitis*.)

Annuals, by seed in a hotbed; perennials, by seed and cuttings of the short side-shoots, in sandy peat, under a bell-glass, and in a good bottom-heat; bulbous and tuberous, by division, and by cuttings of the young shoots, as they commence growing; the bulbs and tuberous ones, especially the hardier ones, are used for herbaceous grafting, merely making a cleft, and slipping the young shoot into the place, claying over, and plunging in a hotbed; stout, short stems, with roots of *Sellovia*, are frequently used for grafting the more tender sorts; peat and loam. Temp. for stove kinds, 60° to 85° in summer; 50° to 60° in winter. The crimson *Horsfallia* requires a good heat.

HARDY ANNUALS.

- I. purpurea*. Purple, midline pink. June to August. Syns., *Convolvulus major* and *C. purpureus*. B. M. t. 113.
 — — *elatior*. White, with blue or pink patches on each petal. Syn., *Convolvulus purpureus*, var. *elatior*. B. M. t. 1005.
 — — *varia*. White, striped with pink and blue. Syn., *Convolvulus purpureus*, var. *varius*. B. M. t. 1682.

STOVE ANNUALS.

- I. caelestina*. Blue. August. 1840. Twinner.
 — *filicanalis*. Yellow. July. E. Ind. 1778.
 — *muricata*. 8. Blue, purple. August. E. Ind. 1777.
 — *tridentata*. 10. Yellow. July. E. Ind. 1778.

HARDY TWINERS.

- I. candicans*. 15. White. July. N. Amer. 1776.
 — *lacunosa*. 10. White. June. N. Amer. 1840. Deciduous.
 — *pandurata*. 12. White, purple. June. N. Amer. 1782. Deciduous. Syn., *Convolvulus candicans*. B. R. t. 1603.

 — *terna'ta.* White. July. Brazil. 1824.
 — *Thomsoniana.* White, striped with green. Ecuador. 1883.
 — *tuberosa.* 10. Pale yellow. August. W. Ind. 1731. Tuber.
 — *uniflora.* August. S. Amer. 1731.
 — *Turpethum.* 5. White. August. E. Ind. 1752. Syn., *Convolvulus Turpethum.* B. M. t. 2093.
 — *Tweedii.* 6. Reddish-purple. July. Parana. 1838.
 — *tyrianthina.* Purple. October. Mexico.
 — *umbellata.* Scarlet. June. S. Amer. 1739.
 — *venosa.* Purple. July. Mauritius. 1820.
 — *vitifolia.* 10. Yellow. July. E. Ind. 1820.

Ipomopsis. (From *ipo*, to strike forcibly, and *opsis*, sight. Nat. ord., *Polemoniaceæ.*) United with **Gilia.**

- I. elegans.* B. M. t. 1281. See *Gilia pulchella.*
 — *inconspicua.* See *Gilia inconspicua.*

I'psæa. (Not explained. Nat. ord., *Orchideæ*; Tribe, *Epidendræ-Eriacæ.*) United with **Pachystoma** in the Genera Plantarum, but retained as a distinct genus in the Flora of British India.

- Stove orchid. Rough peat and a little fibry loam. Summer temp., 60° to 90°; winter 55°.
I. speciosa. May. Ceylon. 1840. B. M. t. 5701. Syn., *Pachystoma speciosum.*

Iresine. (From *eiros*, wool; referring to the woolly aspect of the branches. Nat. ord., *Amaranthaceæ*; Tribe, *Gomphrenæ.* Allied to *Gomphrena.*)

Half-hardy, herbaceous, white-flowered perennials. Division in spring, and by saving and sowing the seeds in a gentle hotbed; sandy loam, leaf-mould, and a little peat. If saved over, must be protected in a cold pit or frame during the winter.

- I. acuminata.* Leaves purple. Mexico. 1869. Fl. Mag. t. 441.
 — *celosioides.* 1‡. July. S. Amer. 1733.
 — *diffusa.* 1‡. July. S. Amer. 1818.
 — *elatior.* 3. July. Antilles. 1820. Annual.
 — *elongata.* 2. July. S. Amer. 1822.
 — *flavescens.* 1. July. S. Amer. 1824. A synonym of *Alternanthera flavescens.*
 — *Herbstii.* Green; leaves dark crimson, veins lighter. S. Brazil. 1864. B. M. t. 5499. Syn., *Achyranthes Verschaffeltii.*
 — *au'reo-reticulata.* Fl. Mag. t. 333.
 — *Lindleyi.* Leaves red, with purplish midrib. Ecuador. 1868. Fl. Ser. t. 1737.

Iria'ritea. (In honour of *Juna*

Iriarte, a Spanish botanist. Nat. ord., *Palmææ*; Tribe, *Areceæ.*)

Stove palms. They sometimes produce aerial roots, which raise the trees from the ground, as if on stilts.

- I. exorrhiza.* 100. Venezuela. 1849. Ill. Hort. t. 436.
 — *gigantea.* G. C. 1872, p. 1105.
 — *no'bilis.* Tropical America. 1869. Syn., *Deckeria nobilis.*
 — *præmorsa.* Venezuela. 1850.
 — *ventricosa.* Rio Negro, Brazil. Ill. Hort. t. 400.

I'ris. (From *iris*, the eye; referring to the variety and beauty of the flowers. Nat. ord., *Irideæ*; Tribe, *Moracæ.* Syns., *Diaphane, Evansia,* and *Xiphion.*)

A beautiful hardy family of summer-flowering plants, though most of the bulbous species will, by forcing, flower early in spring. Herbaceous species, by suckers from the root, and division of their fleshy rhizomes. Bulbous ones, by offsets; and all by seeds. Rich, loamy soil suits the herbaceous; but the others should have a good proportion of sand, leaf-mould and peat.

- I. acuta.* 2. Blue. May.
 — *acutiloba.* Fawn-coloured, purple. Caucasus. 1875.
 — *alata.* †. Blue. June. Algeria. 1801. B. R. t. 1876. Bulbous. There are the following colour varieties of 1889: *alba, cinerea, cupreata, lilacina, magna, nigrescens* and *speciosa.*
 — *Albertyi.* 1. Violet, yellow. Turkestan. 1880.

Irish Heath. *Menziesia polifolia*.

Iron-tree. *Parrotia persica*.

Iron Wood. *Sideroxylon* and *Metrosideros*.

Ironwort. *Sideritis*.

Irouca'na. (The native name in Guiana. Nat. ord., *Samydaceæ*.) United with **Casearia**.

I. guianensis. A synonym of *Casearia ramiflora*.

Irrigation. Experience shows that there is in the kitchen-garden scarcely a crop that is not benefited by a much more abundant supply of water than can be obtained usually; and we can bear testimony to the correctness of Mr. Knight's conclusion, not limiting, however, our approval of such abundant watering to late crops of peas, but to all, as well as beans, spinach, and the entire cabbage tribe. Kidney beans and potatoes are not benefited by such an abundance of water. "The quantity of water," says Mr. Knight, "which may be given with advantage to plants of almost every kind, during warm and bright weather, is, I believe, very much greater than any gardener who has not seen the result will be inclined to suppose possible; and it is greater than I myself could have believed upon any other evidence than that of actual experience. My garden, in common with many others, is supplied with water by springs, which rise in a more elevated situation; and this circumstance afforded me the means of making a small pond, from which I can cause the water to flow out over every part throughout the summer; and I cause a stream to flow down the rows of celery, and along the rows of brocoli and other plants, which are planted out in summer, with very great advantage. But the most extensive and beneficial use which I make of the power to irrigate my garden by the means above-mentioned, is in supplying my late crops of peas abundantly with water, by which the ill effects of mildew are almost wholly prevented, and my table is most abundantly supplied with very excellent peas through the month of October."

Isanthus. (From *isos*, equal, and *anthos*, a flower; referring to the regularity of the flowers. Nat. ord., *Labiatae*; Tribe, *Ajugoidææ*. Allied to *Teucrium*.)

Hardy annual. Seeds in April, in a peaty border, or in a little heat, in March, and transplanted.

I. cœruleus. 1. Blue. July. N. Amer. 1818.

Isaria fuciformis. A fungus of the group *Hyphomycetes*, which has been found in autumn on the old stems of grass, especially *Festuca ovina*, when growing in sandy soils. It is conspicuous on account of its bright scarlet or crimson tufts. It is formed of a compact mass of *mycelial hyphæ*, on the ends of which are formed the *sporidia*, by which the plants are reproduced. It has been stated that cows have died through eating grass thus infected, but this requires confirmation. A figure of the plant is given in G. C. 1882, xvii. p. 377.

Isatis. Dyer's Wood. (From *isazo*, to make equal; from its supposed power to destroy roughness of the skin. Nat. ord., *Cruciferae*; Tribe, *Isatidææ*.)

Hardy biennials. *I. tinctoria* yields a blue dye, for which it has long been cultivated, though to a much smaller extent now than formerly, as it has been almost superseded by indigo. At the time of the Roman invasion the ancient Britons used this plant to stain their skins.

I. Boissieriana. 1. Yellow. Turkestan. 1876.
— *tinctoria*. 2-3. Yellow. Europe. Eng. Bot. ed. 3, t. 161.

Ischarum. See **Biarum**.

Isertia. (Named after *P. E. Isert*, a German surgeon. Nat. ord., *Rubiaceæ*; Tribe, *Mussendææ*.)

Stove evergreen shrub. Cuttings in sandy soil, in a hotbed, in spring or summer; peat and loam, with a little charcoal and silver sand. Summer temp., 60° to 85°; winter, 55°.

I. coccinea. 10. Scarlet. July. Guinea. 1820.

Ismelia. (Probably a commemorative name. Nat. ord., *Compositæ*; Tribe, *Anthemidææ*.) See **Chrysanthemum**.

I. Broussonetii. B. M. t. 5067. See *Chrysanthemum Broussonetii*.

— *carinata*. See *Chrysanthemum carinata*.
— *maderensis*. Swt. Fl. Gard. t. 342. See *Chrysanthemum pinnatifidum*.

Ismene. Peruvian Daffodil. (After *Ismene*, the daughter of *Œdipus* and *Jocasta*. Nat. ord., *Amaryllidææ*; Tribe, *Amaryllidææ*.) Now regarded as a section of **Hymenocallis**, with a large staminal cup, and short free tip to the filaments.

I. Amanœes. See *Hymenocallis Amanœes*.
— *Andrea'na*. See *Hymenocallis Andrea'na*.
— *calathi'na*. B. M. t. 2685. See *Hymenocallis calathina*.

tenuifolia. B. M. t. 6397. See *Hymenocallis quitensis*.
virens. B. R. 1841, t. 12. See *Hymenocallis Macleana*.

Isochilus. (From *isos*, equal, and *cheilos*, a lip. Nat. ord., *Orchideæ*; Tribe, *Epidendrea-Lælicæ*.)

Stove orchids; cultivated like the first section of CŒLOGYNE.

- I. carnosostylis*. 1½. Purple. November. Honduras. 1841.
fusiformis. ½. Yellow. July. Trinidad.
graminifolius. ½. Green, yellow. May. Jamaica. 1823.
grandiflorus. Peru. 1840.
linearis. 1. Purplish. Spring. Central and S. America. 1791. B. R. t. 749. Syn., *Epidendrum lineare*. Andr. Rep. t. 445.
prolifer. White. W. Indies. 1793. B. R. t. 825.

Isolepis. (From *isos*, equal, and *lepis*, a scale; in reference to the equal scales of the perianth. Nat. ord., *Cyperaceæ*. Allied to *Scirpus*, with which it is united in the Genera Plantarum.)

Greenhouse perennial. Seeds, divisions. Loam and peat; give plenty of water. Summer temp., 60° to 70°; winter, 45° to 50°.

- I. gracilis*. ½. Green. A favourite plant for conservatory decoration. Syn., *Scirpus riparius*.
setacea. ½. Brownish. July. Britain.

Isoloma. (From *isos*, equal, and *loma*, a border; lobes of the corolla equal. Nat. ord., *Gesneraceæ*.)

Stove herbs. For cultivation, see GESNERA, to which they are allied.

- I. bogotense*. 1-2. Yellow, red. Autumn. Bogota. 1844. Syn., *Achimenes picta* of B. M. t. 4126.
Cecilæ. 1-1½. Rose, red, white, orange. Cundinamarca. 1877. Syn., *Tydxæ Cecilæ*.
concinnum. Purple-lilac, white. India. 1861. Syn., *Stenogastra concinna*.
Deppænum. 2-3. Orange-red. Summer. Central America. Syn., *Gesneria elongata* of B. M. t. 3725.
digitatiflorum. Rosy-purple, green, white, crimson. Columbia. 1870. Syn., *Sciadocalyx digitatiflora*.
hirsutum. Orange-vermilion, scarlet. Colombia. 1831.
hondense. 1. Yellow, red. December. New Grenada. 1845. Syn., *Gesneria hondensis*. B. M. t. 4217.
hypocrytiflorum. Orange-red. Ecuador. 1866. Syn., *Hypocryta brevicalyx* and *Gloxinia* (B. M. t. 5655) and *Pearcea hypocrytiflora*.
Lindeniænum. White, purple. Ecuador. 1868. Syn., *Tydxæ Lindeni* and *T. Lindeniæna*.
molle. Scarlet, yellow, crimson. S. America. 1876.
ocellatum. Red, white. Winter. Panama. 1847. Syn., *Achimenes ocellatum*. B. M. t. 4359.
parviflorum. Scarlet, black, white, yellow. Columbia.

- I. pictum*. 3. Scarlet, yellow. Columbia. 1848. Syn., *Gesneria picta*. B. M. 4431.
Schiedænum. 1½. Scarlet, yellow. November. Mexico. Syn., *Gesneria Schiedæna*. B. M. t. 4152.
Seemanni. 2. Brick red to orange. October. Panama. 1848. Syn., *Gesneria Seemanni*. B. M. t. 4504.
triflorum. 2. Yellow, red. Summer. New Grenada. 1846. Syn., *Gesneria triflora*, B. M. t. 4342.

Isoloma of J. Smith (Nat. ord., *Filices*) is a synonym of **Lindsaya**.

Isomeris. (From *isos*, equal, and *meris*, a part; referring to the petals, with the stamens and pistils, which are of equal length. Nat. ord., *Cappariaceæ*; Tribe, *Cleomeæ*. Allied to *Cleome*.)

Hardy deciduous shrub. Cuttings of the ripe young shoots, in autumn; sandy loam and a little leaf-mould. The flowers are anything but sweet.

- I. arborescens*. 10. Yellow. May. California. 1839. B. M. t. 3842.

Isonandra. Gutta Percha-tree. (From *isos*, equal, and *ander*, the male organ, or stamen; referring to an equal number of fertile and barren stamens. Nat. ord., *Sapotaceæ*.) See **Dichopsis**.

- I. gutta*. See *Dichopsis gutta*.

Isoplexis. (From *isos*, equal, and *pleko*, to plait; the upper plait or segment of the flower being of equal length with the lip. Nat. ord., *Scrophulariaceæ*; Tribe, *Digitaleæ*. Allied to the Foxglove.)

Greenhouse evergreen shrubs. Seeds and cuttings of half-ripened short shoots in spring, in sand, under a bell-glass; sandy loam and rough leaf-mould. Winter temp., 40° to 45°.

- I. canariensis*. 4. Yellow. June. Canaries. 1698. Syn., *Digitalis canariensis*. B. R. t. 48.
septrium. 2. Yellow, brown. July. Madeira. 1777. Syn., *Digitalis septrium*.

Isopogon. (From *isos*, equal, and *pogon*, a beard; referring to the beard-like fringes on all parts of the inflorescence. Nat. ord., *Proteaceæ*; Tribe, *Protea*. Allied to *Protea*.)

Greenhouse evergreen shrubs, from Australia. Cuttings of ripe young shoots, with most of the leaves left, inserted firmly in silver sand, over sandy loam and peat, and covered with a bell-glass or hand-light, and kept in the shade; when the cuttings are callusing at the bottom, they may be pushed on by giving them a little mild bottom-heat, but not before; fibry loam three parts, fibry peat one part, charcoal, broken freestone, and broken crocks one part; good drainage; watering must be given with great attention, as much dryness or much moisture are alike ruinous. Summer temp., 50° to 75°; winter, 35° to 45°. In summer, if the plants are out of doors, the sun should not strike freely on the sides of the pot.

- I. anemonifolius*. 5. Yellow. July. 1791. Syn., *Protia anemonifolia*. B. M. t. 697.
 — *attenuatus*. 3. Yellow. April. B. M. t. 4372.
 — *Baate'ri*. 2. Rose. April. 1831. B. M. t. 3539.
 — *buaxifolius*. Purple. Syn., *I. spatulatus*.
 — *lined'ris*. 2. Purple. September. 1830. Syn., *I. spatulatus*, var. *linearis*. B. M. t. 3450.
 — *co'rriger*. See *I. teretifolius*.

 — *sphaerocephalus*. 4. Yellow. March. B. M. t. 4332.
 — *teretifolius*. 4. Syn., *I. corniger*.

Isotoma. (From *isos*, equal, and *toma*, a section; the corolla's segments are equal-sized. Nat. ord., *Lobeliaceae*.)

Greenhouse plants. For cultivation, see LOBELIA.

- I. axillaris*. 1. Blue. June. Queensland. 1824. Perennial. Syns., *I. senecioides*, B. M. t. 5073, and *Lobelia senecioides*, B. M. t. 2702.
 — *breviflorum*. White. July. S. America. Syn., *Hippobroma breviflorum*.
 — *Brod'witi*. 1. Red. September. W. Australia. 1829. Annual. Syn., *Lobelia hypocrateriformis*, B. M. t. 3075.
 — *longiflora*. White. Summer. W. Indies. 1752. Perennial. Syns., *Lobelia longiflora*, B. R. 1290, and *Hippobroma longiflorum*.

Isotropis. (From *isos*, equal, and *tropos*, turned; referring, probably, to the distinctly-forked veins in the flower. Nat. ord., *Leguminosae*; Tribe, *Podalyriaceae*. Allied to *Gompholobium*.)

Greenhouse evergreen shrub. Cuttings of the young shoots, when getting a little firm, in sand over sandy peat, and covered with a bell glass, in June; sandy peat, with a little fibry loam, pieces of charcoal, and broken crocks; drainage and watering must be particularly attended to. Winter temp., 40° to 48°; summer, a shady place, or a cold pit, where the plant partly, and the pot wholly, are sheltered from the sun's rays.

- I. striata*. 1. Orange. June. Swan River. 1838. Syn., *Chorozema spartioides*. B. C. t. 1953.

Iso'typos. (From *isos*, equal, and *typos*, a mark. Nat. ord., *Compositae*.) See **Onoseris**.

- I. rosiflorus*. L'Hort. Fr. 1864, p. 10. See *Onoseris rosiflora*.

Italian Star-wort. *Ame'llus lychni'tis*.

I'tea. (The Greek name for the Willow, applied to this genus on account of its rapid growth in damp soil.

Nat. ord., *Saxifragae*; Tribe, *Escalloniae*. Allied to *Escallonia*.)

A hardy deciduous shrub. Seed and suckers in spring; layers in summer; moist, sandy peat.

- I. spinosa*. Andr. Rep. t. 314. A synonym of *Bursaria spinosa*.
 — *virginica*. 6. White. July. N. Amer. 1774. B. M. t. 2409.

Ivory-nut palm. *Phytel'phas macrocarpa*.

Ivy. *He'dera*.

Ixa'nthus. (From *Ixos*, mistletoe, and *anthos*, flower; in reference to the sticky flowers. Nat. ord., *Gentianeae*.)

Greenhouse herbaceous biennial. Seeds in spring.

- I. viscosa*. 1½. Yellow, white. June. Canary Islands. Syns., *Exacum viscosum* and *Gentiana viscosa*, B. M. t. 2135.

I'xia. (From *ixia*, bird-lime; in reference to the clammy-juice. Nat. ord., *Irideae*; Tribe, *Ixiaceae*.)

Half-hardy bulbs, from the Cape of Good Hope. The true *Ixias* are known from *Sparaxis* by not having, like it, a jagged sheath; from *Babia'na*, in having a dry seed-pod instead of a berry; and from *Tritonia*, by having the stamens inserted at the bottom of the petals instead of in the tube of the flower. They will all grow in rough peat; the strong ones require very little sand, and the smaller ones want one-third sand in the compost. They succeed well in a warm border, if sheltered from hard frosts, and not allowed to get dry when they are in growth. By seeds sown in a little heat, in spring; also by off-sets; sandy loam, peat, and a little leaf-mould. When done flowering, they may be kept in or out of the pots, after the leaves get withered, without any water, until fresh growth commences. They will generally require to be potted in October, and should then be placed in a cold pit, and protected from frost, and cold, heavy rains, and taken to the greenhouse or window, after roots are plentifully formed. Many will do very well if planted in sandy soil and leaf-mould, about four inches deep, in a dry, raised border, and protected there from severe frost and heavy rains by litter, and any material that will throw off the water.

Ixioli'ron. (From *ixia*, and *leirion*, a lily; literally, Ixia-like Lily. Nat. ord., *Amaryllideæ*; Tribe, *Alstræmerieæ*. Allied to *Bravoa*.)

Extremely rare, pretty, hardy bulbs, Dr. Herbert being the only person who recently possessed them in this country. His own plant of *I. montanum* was the first specimen he saw in flower, and that in May, 1846, as he told us. It had a spiked inflorescence, while that of *I. tataricum* is terminal; both have sky-blue flowers. *Montanum* has been taken by some to be the "lily of the field." Seeds, and offsets of the bulbs, which are not at all particular as to soil.

Ixo'dia. (From *ixodes*, viscid; in reference to the viscid secretions on the plant. Nat. ord., *Compositæ*; Tribe, *Inuloideæ*. Allied to *Ammobium*.)

Greenhouse evergreen shrub. Cuttings of the young shoots, getting hard at their base, in May, in sand, under a bell-glass, and kept in a close frame or pit; sandy peat, and a little fibry loam. Winter temp., 45° to 50°.

- I. achilleoi'des*. 2. White. June. Victoria and S. Australia. 1803. B. M. t. 1534.

Ixo'ra. (Named after an Eastern heathen god, *Iswara*, to which the flowers are offered. Nat. ord., *Rubiaceæ*; Tribe, *Ixoreæ*.)

Beautiful stove evergreen shrubs. Cuttings of the half-ripened shoots in sand, over sandy peat, under a bell-glass, and in a brisk bottom-heat; sandy, fibry loam, and fibry peat, with pieces of charcoal, and broken bricks or pots. Summer temp., 60° to 90°; winter, 50° to 60°. Most stove plants delight in bottom-heat, where it can be given to them when growing and preparing for blooming, but none more so than this genus, as it is next to impossible to get it in its most

splendid condition without such aids. Of all means of bottom-heat, this, like the Cape Jasmynes and others, delights in that produced from sweet, fermenting dung and leaves; and if so given, the insects that attack it—the scale, the red-spider, and sometimes the mealy bug—will be kept away. If this method is not resorted to, the plants will require frequent sponging with soap-water.

J.

Jaborosa. (From *Jaborose*, the Arabic for the Mandrake, an allied plant. Nat. ord., *Solanaceae*; Tribe, *Solanaceae*.)

Herbaceous perennials. Division of the plant in spring; seeds in spring; and cuttings of the young shoots under a hand-light; light, sandy loam.

- J. integrifolia*. 3. White. August. Buenos Ayres. Hardy. B. M. t. 3489.
runcinata. 1/2. Green, yellow. Plata. 1831. Greenhouse. A synonym of *Himeranthus runcinatus*.

Jacarana. (The Brazilian name. Nat. ord., *Bignoniaceae*; Tribe, *Jacaranaceae*.)

Stove evergreen trees. Cuttings of half-ripened shoots in the beginning of summer, in sand, over sandy peat, and placed in bottom-heat, well shaded, or covered with a bell-glass; sandy peat, fibry loam, with charcoal, to keep the soil open. Summer temp., 60° to 85°; winter, 45° to 50°. In summer give plenty of water, but keep them cool and dryish in winter.

Jasonia. (After *Jason*, the Argonaut. Nat. ord., *Compositae*; Tribe, *Inuloideae*.)

Hardy herbaceous perennial. For culture, see **INULA**.

- I. glutinosa*. $\frac{3}{4}$. Yellow. July. South Europe. 1816. Syn., *Inula saxatilis*.

Jateorhiza. (From *iatos*, healing, and *rhiza*, root; in allusion to the bitter tonic it furnishes, known as Calumba-root. Nat. ord., *Menispermaceae*.)

Herbaceous perennial, cultivated like **Cocculus**.

- J. Calumbae*. Pale green. Mozambique. Syn., *J. palmatus* and *Cocculus palmatus*. B. M. tt. 2970-1.

Ja'tropha. (From *iatros*, physician, and *trophe*, food; referring to its medicinal qualities. Nat. ord., *Euphorbiaceae*; Tribe, *Crotoneae*.)

Cassava bread and tapioca are made from the roots, although the juice is an acrid poison. Stove evergreen shrubs, except *herbacea*. Sometimes by seed, in sandy peat, in a hotbed; cuttings of young firm shoots in sandy soil, in a brisk bottom-heat; let the bottom of the cutting be dried before inserting; sandy peat and fibry loam. Summer temp., 60° to 85°; winter, 55° to 60°.

Jefferso'nia. (Named in honour of T. Jefferson, president of the United States of North America. Nat. ord., *Berberidaceæ*; Tribe, *Berberææ*. Allied to *Diphylleja*.)

Hardy herbaceous perennial. Seeds and division of the plant, in spring; common, sandy garden-soil.

J. diphyl'la. White. May. N. Amer. 1792. B. M. t. 1513.

Je'hlia fuchsioi'des. See *Lopezia macrophylla*.

Jenki'nsia. (After Major Jenkins, who collected plants in Assam. Nat. ord., *Filices*.) A synonym of *Acrostichum*.

Jenkinso'nia. (After J. Jenkinson, who wrote on British plants in 1775. Nat. ord., *Geraniaceæ*.) A synonym of *Pelargonium*.

Jerdo'nia. (In honour of Surgeon-Major T. C. Jerdon, of the Indian army, an eminent ornithologist. Nat. ord., *Gesneraceæ*; Tribe, *Cyrtandreeæ*.)

Small stove plants. Sandy loam. Moist atmosphere. Summer temp., 60° to 70°; winter, 50° to 55°.

J. indiae. ½. Lilac, crimson. Autumn. Neilgherri Mountains. 1870. B. M. t. 5814.

Jersey Thistle. *Centaurea isna'rdis*.

Jerusalem Artichoke (*Helianthus tuberosus*), flourishes most in a rich, light soil, with an open exposure. Plant middle-sized tubers, or cuttings of the large ones, one or two eyes being preserved in each. Plant towards the end of March, though it may be performed in February, or even preferably in October.

Insert by the dibble in rows three feet apart each way, and four inches deep. The only attention necessary is an occasional hoeing to loosen the surface, a little of the earth being drawn up about the stems. Early in August cut the stems off about their middle, to admit

more freely the air and light, and in other respects to be beneficial to the tubers.

They may be taken up as wanted during September, and in October, or as soon as the stems have withered entirely, for preservation in sand for winter's use. They should be raised as completely as possible; for the smallest piece of tuber will vegetate and appear in spring. It is for this reason that they are often allotted some remote corner of the garden; but their culinary merits certainly demand a more favourable treatment.

Jerusalem Sage. *Phlo'mis fruticos'a*.

Jerusalem Thorn. *Parkinsonia aculeata*.

Jessamine. *Jasminum officinale*.

Jet d'Eau. See **Fountain**.

Jew's Apple. *Solanum melongena*.

Job's Tears. *Co'ix*.

Joe Pye Weed. *Eupatorium purpureum*.

Jolli'fia africa'na. See *Telfairia pedata*.

Jone'sia. (Named after Sir W. Jones. Nat. ord., *Leguminosæ*.) See **Saraca**.

Jossi'nia. See **Myrtus**.

J. Lama'rekii. Fl. Ser. t. 621. See *Myrtus elliptica*.

— *orbicula'ta*. A synonym of *Myrtus elliptica*.

Jove's Fruit. *Laurus diospy'ros*.

Juanullo'a. (Named after two Spaniards, Don G. Juan and Don Ulloa. Nat. ord., *Solanaceæ*; Tribe, *Cestrineæ*. Allied to *Cestrum*.)

Stove evergreen shrubs, with orange flowers. Cuttings in sand, under a glass, in hot-bottom-heat; rough peat; and a moist, high temperature, in a stove.

J. aurantiaca. June. S. Amer. 1840. Syns., *J. parasitica*, B. M. t. 4118, *Brugmansia floribunda* and *B. parviflora*.

— *eximia*. B. M. t. 5092. See *Dysochroma ezimia*.

— *parasitica*. B. M. t. 4118. A synonym of *J. aurantiaca*.

Juba'ea. (After Juba, ancient king of Numidia. Nat. ord., *Palmaceæ*; Tribe, *Cocoinææ*.)

Stove palm. Its small round fruits were sold in London as "Little Coker nuts." Seeds in hot-bed in spring. Rich loam.

J. spectabilis. 30. Chili. 1843.

Judas-tree. *Cercis*.

Ju'glans. Walnut. (From *Jupiter Jovis*, the heathen god, and *glans*, a nut. Nat. ord., *Juglandææ*.)

Hardy deciduous trees, all blossoming in April. Nuts sown when gathered, or preserved until the following spring, in order to keep them from vermin; also grafting and budding the more rare species and varieties. In budding, the small, almost inconspicuous buds at the base of the year's shoots are to be chosen; deep, loamy soil. In such soils the nut should be inserted where the tree is to grow; in all poor soils it is better to be transplanted, so as to cut the tap-root, and cause the roots to feed more among the good surface-soil.

J. atlantifolia. Greenish. Spring.

— *alba*. Wats. Dendr. t. 148. See *Carya alba*.

— *tomentosa*. See *Carya tomentosa*.

Jujube. *Zizyphus jujuba*.

Ju'lus. Snake millipede. *J. terrestris* has about 200 legs. Lead colour. Scaly, like the woodlouse. Is said to eat the root of the pansy.

J. pulchellus.—Ochreous colour, with crimson spots down its sides. Legs, about 170. Is said to attack roots of beans, cabbages, peas, and scarlet beans.

J. complanatus.—Lilac colour. Sixty legs. Is said to eat potato-tubers. *J. pulchellus* is also found in the fruit of the strawberry; but in every instance we doubt whether the plant in which the millipede is found has not first been injured by slugs, or some other cause, so that decay has commenced.

July-flower. *Prosopis juliflora*.

Ju'ncus. Rush. (From *jungo*, to join; the stems being used as cordage. Nat. ord., *Juncææ*.)

Bog plants of little horticultural value.

J. effusus spiralis. Stems spirally twisted.

— *latevirens*. 3. Japan. 1880.

— *zebrinus*. See *Scirpus Tabernæmontani*.

June Berry. *Amelanchier*.

Ju'ngia. (After *Joachim Jung*, of Lübeck. Nat. ord., *Compositæ*.)

Stove evergreen shrub. Cuttings in sandy soil, under a bell-glass; sandy loam.

J. spectabilis. 3. Purple. August. Columbia. 1825. Syn., *Dumerilla paniculata*.

Juniper Moth. The Irish Juniper is sometimes much disfigured by the caterpillar of a small moth, bearing the name of *Ypsolophus marginellus*. The caterpillar is dark grey, with a slender reddish-brown line down the back, and a broader one of the same colour on each side. The head and the first segment of the body are dark brown; the other segments are each furnished with eight blackish hairs. It has four pairs of central, and one pair of anal, pro-legs. When the larvæ are hatched they commence to spin a web, fastening the leaves of the Juniper together in an irregular manner, much to their disfigurement; added to which, they feed upon the young leaves, and thereby render the shrubs still more unsightly. The moth is about two-thirds of an inch in expanse; the front wings are ochreous, with a white stripe along the front margin, and another just within the hind margin, curving up towards the tip of the wing; the hind wings are silvery grey.

The best plan to stay their ravages is to hand-pick and destroy the young larvæ as soon as they make the appearance, which is about the beginning of June.

Juni'perus. Juniper. (From the Celtic *juniperus*, rough. Nat. ord., *Coniferae*; Tribe, *Cupressineæ*.)

Seeds, which will retain their vitality for years, and when sown, seldom vegetate under a twelve-month, and sometimes nearer two years; cuttings in the end of summer, in a shady border, in sandy, firm soil, and covered with hand-glasses; sandy loam. The berries of the common juniper are used for flavouring gin.

Justi'cia. (Named after *J. Justice*, a celebrated Scotch horticulturist. Nat. ord., *Acanthaceæ*; Tribe, *Justiceæ*. Allied to *Eranthemum*.)

Annuals and biennials, by seed in a hotbed, and to be treated as tender and half-hardy annuals; many of them, and all the shrubs and herbaceous species, are easily propagated by cuttings, old shoots, and young side-shoots, striking very soon in sandy soil, under a glass, in heat, most of the leaves being allowed to remain. As they are fast growers, where room is at all valuable, young ones should be grown, and the old ones thrown away every year; peat and loam. Summer temp., 60° to 85°; winter, 48° to 55°. The following are a few of the best:—*Cocci'nea*, *car'nea*, *coma'ta*, *formosa*, *lu'cida*, *salviaeflora*, and *specio'sa*.

Jute-plant. *Co'rchorus capsularis*.

K.

Kadsu'ra. (The Japanese name. Nat. ord., *Magnoliaceæ*; Tribe, *Schizandraceæ*.)

A trailing half-hardy evergreen. Cuttings of half-ripened wood in sand, under a bell-glass, and in heat, in May; peat and loam.

- K. japonica*. White. June. Japan. 1846.
 — *propinqua*. See *Schizandra propinqua*.

Kæmpferia. Galangale. (Named after *Kæmpfer*, a German naturalist. Nat. ord., *Scitamineæ*; Tribe, *Zingiberaceæ*. Allied to *Curcuma*.)

Stove herbaceous perennials. Division of the plant as fresh growth commences; sandy loam, fibry peat, and leaf-mould. Temp., 45° to 55° when at rest; from 60° to 85° when growing.

- K. elegans*. 1. Purple. Pegu. 1828.
 — *galanega*. 1. White, purple. July. E. Ind. 1728.
 — *Gilbertii*. Purple, white. E. Indies. G. C. 1882, xvii. p. 713.

 — *Rosecea* na. India.
 — *rotunda*. 1. Red, white. July. E. Ind. 1764.
 — *secunda*. 1. Bright purple, white. Assam. 1888. B. M. t. 6999.
 — *speciosa*. Violet-purple. S. Africa. 1870.
 — *vittata*. ¾. White, yellow. Sumatra. 1882.

Kagene'ckia. (Named after *Count Kageneck*, a patron of botany. Nat. ord., *Rosaceæ*; Tribe, *Quillajaceæ*.)

Half-hardy evergreen trees, from Chili, with white flowers. Cuttings of rather ripe shoots in sand, under a bell-glass; probably, also, by grafting on some rosaceous plant, as the Hawthorn; loam, with a little sandy peat. Winter temp., 35° to 45°. *K. cratægifolia* has stood for years against a conservatory wall in the Chiswick Gardens, and produced fruit there in 1837. The male flowers are in clusters; the female flowers are solitary.

- K. cratægifolia*. 10. White. June. Chili. 1830. Syn., *K. cratægoides*. B. R. t. 1836.
 — *oblonga*. 30. White. Autumn. Chili. 1830.

Kalanko'e. (From the Chinese name of one of the species. Nat. ord., *Crassulaceæ*. Allied to *Rochea*.)

Stove succulent evergreens. Cuttings dried at their base soon root in sandy loam, in a little heat; sandy loam. Summer temp., 60° to 80° and abundance of water when growing and flowering. Winter temp., 45° to 55°, and almost dry.

- K. acutiflora*. 2. White. August. E. Ind. 1806. Syn., *Vareia acutiflora*. Andr. Rep. t. 560.
 — *ægyptiaca*. 2. Yellow. July. Egypt. 1820.

 — *spathulata*. 2. Yellow. July. China. 1820. Syn., *Cotyledon hybrida*.
 — *va'rriana*. Yellow. July. E. Ind.

Kale. See **Borecole**.

Ka'l'mia. (Named after *Peter Kalm*, a Swedish botanist. Nat. ord., *Ericaceæ*; Tribe, *Rhodoreæ*. Allied to *Azalea*.)

Hardy evergreens, all from North America, and all red-flowered, except where specified. By cuttings of young shoots in sandy peat, in a shady place, under hand-lights; by layers made at the end of summer; by seeds sown in shallow pans filled with sandy peat, and kept close in a frame until the seedlings are up, pricked off when fingerable, kept close again, and gradually inured to the open air; sandy peat-soil is best, though they often thrive well in sandy loam and leaf-mould; good for forcing.

K. andromedifolia. 1-4. Rosy-purple. 1883.
— *angustifolia*. 3. June. 1736. B. M. t. 331.

Sheep laurel.

- *foliis variegatis*. 2. June.

- *Pava'rti*. Garden variety. Garden. July 1, 1832.

Kalosa'nthes. A synonym of *Rochea*, and now erroneously applied to *Cra'ssula coccinea* and its varieties. See *Rochea*.

Kanguru Vine. *Cissus anta'rticus*.

Ka'ratas. (Probably a native name. Nat. ord., *Bromeliaceæ*; Tribe, *Bromeliceæ*. Syn., *Regelia*.)

Stove perennials. For cultivation, see *BROMELIA*, in which genus the species were formerly included.

- K. acanthocra'ter*. Lilac. May. Brazil. 1877. B. M. t. 6904. Syn., *Nidularium acanthocra'ter*.
- *antiaca'ntha*. Base of leaves brownish; bracts deep scarlet. A synonym of *Bromelia fastuosa*?

Kareli'nia. (Derivation not explained. Nat. ord., *Compositæ*; Tribe, *Inuloidææ*.) United with *Pluchea* in the Genera Plantarum, but retained as a distinct genus by Boissier.

Hardy herbaceous. Divisions of the plant in spring; common garden-soil.

- K. caspia*. Purple. August. Caspia.
- Kaulfu'ssia.** (Named after *Dr. G. F. Kaulfuss*, a Professor of Botany at Halle. Nat. ord., *Filices—Marattiaceæ*. Allied to *Danæa*.)

A curious stove fern, with a frond like a chestnut-leaf. For cultivation, see *FERNS*.

- K. æsculifolia*. 2. E. Indies. Syn., *Aspidium æsculifolium*.
- *amelloides* of B. M. t. 2177 is a Composite. See *Charieis heterophylla*.
- *ciliata*, also a Composite, is a synonym of *Felicia tenella*.

Kauri Pine. *Da'mmara australis*.

Keferstei'nia. (In honour of *Mr. Keferstein* of Kröllwitz, a cultivator of orchids. Nat. ord., *Orchidææ*; Tribe, *Vandææ*.) See *Zygopetalum*.

Kelp is the ash remaining after seaweed is burnt, and has been used with great advantage as a manure to potatoes, brocoli, and other species of cabbage-worts. It is composed of carbonate of soda, and iodide and bromide of potassium, carbon, sulphates of lime and magnesia, and other matters of trivial importance. See *Green Manure*.

Kenne'dya. (Named after *Mr. Kennedy*, of the firm of Lee and Kennedy, nurserymen. Nat. ord., *Leguminosææ*; Tribe, *Phaseoleææ*.)

Greenhouse evergreen twiners, from Australia. Cuttings of short side-shoots getting firm, in April and May, in sand, over sandy peat, under a bell-glass, kept close for a fortnight, and then put into a little extra heat; peat and sandy loam. Winter temp., 40° to 48°, and most of them like a little shade in summer. All the species, also, may be easily propagated by seeds, which, after being soaked in warm water for a few hours, may be sown in sandy soil, and placed in a hotbed.

Kentucky Coffee-tree. *Gymnocladus*.

Kerama'nthus. (From *keramos*, a jar, and *anthos*, a flower; in allusion to the form of the calyx. Nat. ord., *Passifloraceæ*. Allied to *Modecca*.)

An interesting perennial. It requires to be grown in a dry stove, like that where cacti and other succulents are grown. Rich sandy loam.
K. Kirkii. 2. Green. Zanzibar. 1875.

Kercho'vea. (After *Dr. Kerchove*. Nat. ord., *Scitamineæ*; Tribe, *Marantææ*.) See **Stromanthe**.

- K. floribunda*. Belg. Hort. 1882, p. 201, t. 8. See *Stromanthe Porteana*.

Ke'rria. (Named after *M. Kerr*, once superintendent of the Botanic Garden, Ceylon. Nat. ord., *Rosaceæ*; Tribe, *Spirææ*. Allied to *Spiræa*.)

Hardy deciduous shrub, with yellow flowers, from Japan, formerly called *Corchorus japonicus*. Cuttings of the young shoots under a hand-

light; layers, and division of the plant; common loam.

- K. japonica*. 3-6. Blooms through summer. 1700. B. M. t. 1873. Syn., *Corchorus japonicus*. B. M. t. 1296.
 — *jo're-pleno*. 6. June. 1700.

Ketelee'ria. A synonym of **Abies**.

Kidney Bean. *Phaseolus vulgaris*.

Varieties.—There are three kinds—the *Runners*, or twining varieties; the *Dwarfes*; and the *Skinless*, or *Mange-tout*. These last, and the runners, are those most commonly cultivated, being eaten pod and seed together, whilst of others only the seeds are eaten.

Runners.—*Large Running White*, *White Long Pod*, *Dutch Case Knife*, *Long White*, or *Large White Sugar*. A good bearer, and one of the best for late use.

Sabre. Seeds white. This is, perhaps, the best of all, being a good bearer, and its pods of great length and size. This sort grows very high.

Prudhomme, or *Prodomet*. Seeds greyish, oval, and small. There is a yellow variety of this.

Prague, or *Red Pea*. Seeds round, of violet colour. A moderate bearer, and late.

Prague Bicolor. Similar to the last, seed a little larger. A good bearer, but very late.

Sophie. Like the Prague, but seeds whiter and larger. A moderate bearer, and late.

Small White French Runner. White seeds, oblong, and very thin. It is a good bearer, but is too tender to ripen its seeds in this country, except under a wall in a very warm situation.

Lima. Seeds very large, thick, and of a dirty white; pods large, short, slightly rough, and wrinkled. Prolific, and the seeds are very mealy; but in this climate a crop can only be obtained by forcing the plants in a hotbed, and planting them out singly in May. It is eaten both in a green state and shelled. It grows high.

Venetian Sugar. Resembling Lima, the principal difference consisting in the seeds being flatter, larger, and speckled with red. An abundant bearer, but must be used young.

Pale Turkey, or *Scarlet Runner*. Of this there are two varieties distinct from the common Haricot, one with scarlet, the other with white flowers; the latter is preferable for culinary purposes on account of its greater meanness and thinner skin. There is also a third variety with two-coloured flowers, but it

is not superior to either of the above. A good bearer, but not very early.

Dwarf.—*Dwarf White Dutch*, *Dutch Long Pod*, or *Early Dwarf Dutch*. Pods long, narrow, and excellent when green; seeds white, small, a little compressed. Not very early in this country.

Early White, or *Brewer's White*. Seeds white, narrow, rather long, and cylindrical. It is very dwarf, early, good for forcing, equally suited for eating green, and when the seeds are ripe.

Dwarf White Sans-parchemin forms thick, bushy plants. Good whilst green; stringless till three parts grown, and excellent when ripe.

Dwarf American White. Pod short, of a strong and branching habit, sometimes climbing a little, but generally dwarf, and not requiring support; very prolific; its short, swollen pod a little hooked, strongly coloured with reddish-brown, particularly at the two extremities; this is not in the least stringy.

Of the *Haricot Suisse* there are many varieties, of which the principal are the *White*, the *Grey*, and the *Red*.

Dwarf Black-Spotted. Grown particularly in the Maine. The *Mohawk* from the United States.

Dwarf, Red-Speckled, *Fulner's Spotted Dwarf*, and *Long-Spotted French*. These have peculiar characters, according to the length and form of their seeds. They are all excellent in a green state, for which they are chiefly used.

Dwarf Negro. Used in a green state; this rivals the Swiss varieties. This is one of the best for general use, and an abundant bearer.

Haricot Noir de Belgique. Is perfectly dwarf, and is the earliest which we are yet acquainted with. Its pods, although rather pale, are very good in a young state.

Crimson Runner. Highly esteemed for stewing when ripe; seeds red, flat, and small.

Flat Yellow Canada. The most dwarf, and one of the earliest skinless, and therefore either good when young, or when full grown; seeds nearly round, pale yellow, very good when dried. A good bearer.

Polish Beans. A prolific sort, excellent either fresh-shelled or dried; seeds rather large, roundish, and sulphur-coloured. There is a sub-variety of it with clear, bronze-coloured seeds, which also appears to be good. A good bearer, and early.—*Gard. Chron.*

Soil and Situation.—A very light, mellow, well-drained loam. For the early and late crops, a sheltered border

must always be allotted, or in a single row about a foot from a south fence, otherwise the situation cannot be too open.

Sowing commences with the year. They may be sown towards the end of January in pots, and placed upon the fire of the hothouse, or in rows in the mould of a hotbed, for production in March, to be repeated once every three weeks in similar situations in February and March, for supplying the table during April; a small sowing may be made, if fine open weather, under a frame without heat, for removal into a sheltered border early in May. The chief requisite for success in the hothouse is to have them near the glass; to keep them well watered; the air moist, and ventilated as much as the season permits.

During May, and thence until the first week in August, sowings may be made once every three weeks. In September, forcing recommences, at first merely under frames without bottom-heat; October, and thence to the close of the year, in hotbeds, etc., as in January. Sowing, when a removal is intended, should always be made in pots, the plants being less retarded, as the roots are less injured, than when the seed is inserted in patches or rows in the earth of the bed. It is a good practice, likewise, to repeat each sowing in the frames without heat after the lapse of a week, as the first will often fail, when a second, although after so short a lapse of time, will perfectly succeed. In every instance the seed is buried one and a half or two inches deep. The rows of the main crops to be two feet apart, the seed being inserted either in drills or by the dibble, four inches apart; the plants, however, to be thinned to twice that distance. If a vacancy occurs, it may always be filled by plants which have been carefully removed by the trowel from where they stood too thick. The seed inserted during the hottest period of summer should be either soaked in water for five or six hours, laid in damp mould for a day or two, or the drills be well watered previously to sowing.

The pods of both kinds are always to be gathered while young; by thus doing, and care being had not to injure the stems in detaching them, the plants are rendered prolific and long lived.

Forcing.—The hotbed must be of moderate size, and covered with earth nine inches thick. When the heat has become regular, the seed may be inserted

in drills a foot apart, and the plants allowed to stand six inches asunder in the rows. Air must be admitted as freely as to the melon. The same precautions are likewise necessary as to keeping up the temperature, taking the chill off the water, etc., as for that plant. When the seed begins to sprout, the mould should be kept regularly moistened; and when grown up, water may be given moderately three times a week. The temperature should never be less than 60°, nor higher than 75°.

Those sown under frames in March for transplanting into a border, when two or three inches in height, must, in a like manner, be hardened gradually for the exposure, by the plentiful admission of air, and the total removal of the glasses during fine days. If any are raised in pots in the hothouse, they must be prepared similarly for the removal, by setting them outside in fine days, and there watering them with cold water.

If the season is too ungenial to remove them even to a warm border, the plants are often inserted in patches, to have the protection of frames or hand-lights at night, or as the weather demands.

Runners.—As these are more tender, and the seed is more apt to decay, than those of the dwarfs, no open-ground crop must be inserted before early in May, to be continued at intervals of four weeks through June and July, which will insure a supply from the middle of this last month until October.

They are so prolific and such permanent bearers, that three open-ground sowings of a size proportionate to the consumption, will, in almost every instance, be sufficient.

They are inserted in drills, either singly, three feet apart, or in pairs ten or twelve inches asunder, and each pair four feet distant from its neighbour. The seed is buried two inches deep, and four apart in the rows, the plants being thinned to twice that distance.

If grown in single rows, a row of poles must be set on the south side of each; being fixed firmly in the ground, they may be kept together by having a light pole tied horizontally along their tops, or a post being fixed at each end of a row, united by a cross bar at their tops: a string may be passed from this to each of the plants. If the rows are in pairs, a row of poles must be placed on each side, so fixed in the ground that their summits cross, and are tied together.

If the runners are nipped off as fast as

they appear, the plants become bushy, and are nearly as prolific as if allowed to climb.

To obtain Seed.—Forty or fifty plants of the dwarf kinds, or thirty of the runners, will be sufficient for a moderate-sized family. They must be raised purposely in May, or a like number from the crop in that month left ungathered from; for the first pods always produce the finest seeds, and ripen perfectly. In autumn, as soon as the plants decay, they must be pulled up, thoroughly dried, and stored in the pods.

Kidney Vetch. *Anthyllis*.

Kielme'jera. (Named after a German patron of botany. Nat. ord., *Ternströmiaceæ*; Tribe, *Bonnetiaceæ*.)

Stove evergreen tree. Cuttings of young shoots getting firm, in sand, under a bell-glass, and in heat; fibry, sandy loam. Summer temp., 60° to 75°; winter, 45° to 55°.

K. excel'sa. 60. White. July. Brazil. 1833.

Ki'ngia. (After *Captain P. G. King*, Governor of New South Wales. Nat. ord., *Junceæ*.)

Greenhouse perennial. For culture, see XANTHORRHEA.

K. australis. 4. Brownish. West Australia.

King of the Woods. *Anectochilus regalis*.

Kirengeshoma. (From the native name. Nat. ord., *Saxifrageæ*; Tribe, *Hydrangeæ*.) Allied to *Hydrangea*, which see for culture.

K. palmeta. 3-4. Yellow. Japan. G. C. 1891, ix. p. 202.

Kirganelia. (Derived from the Malabar name. Nat. ord., *Euphorbiaceæ*.) See **Phyllanthus**.

K. elegans. See *Phyllanthus casticum*.

Kitchen Garden.

Situation.—A gentle declination towards the south, with a point to the east, is the most favourable aspect; to the north-east the least so: in short, any point to the south is to be preferred to one verging towards the north. A high wall should inclose it to the north and east, gradually lowering to the south and west. If, however, a plantation or building on the east side, at some distance, shelter it from the piercing winds which blow from that quarter, and yet are at such a distance as not to intercept the rays of the rising sun, it is much to be preferred to heightening the wall. It is a still greater desideratum to have a similar shelter, or that of a hill on the south-west and north-west points. The garden is best situated at a moderate elevation; the summit of a hill or the

bottom of a valley is equally to be avoided. It is a fact not very difficult of explanation, that low-lying ones are the most liable to suffer from blights and severe frosts; those much above the level of the sea are obviously most exposed to inclement winds.

Size.—To determine the appropriate size of a kitchen-garden is impossible. It ought to be proportionate to the size of the family, their partiality for vegetables, and the fertility of the soil.

It may serve as some criterion to state, that the management of a kitchen-garden occupying the space of an acre affords ample employment for a gardener, who will also require an assistant at the busiest periods of the year. In general, a family of four persons, exclusive of servants, requires a full rood of open kitchen-garden.

Kleinho'via. (Named after *Mr. Kleinhoff*, a Dutch botanist. Nat. ord., *Sterculiaceæ*; Tribe, *Buettneriaceæ*. Allied to *Thebroma*.)

Stove evergreen tree. Cuttings of ripe young shoots in sand, under a bell-glass, in heat; peat and loam. Summer temp., 60° to 90°; winter, 50° to 60°.

K. ho'spita. 20. Pink. Constant. Moluccas. 1800.

Klein'ia of Haworth. (After *Dr. Klein*. Nat. ord., *Compositæ*; Tribe, *Senecionideæ*.) United with **Senecio** in the Genera Plantarum.

Greenhouse evergreens. For culture, see **CACALIA**.

- K. articulata*. 1½. Yellow. September. South Africa. 1775. Syn., *Cacalia articulata*.

Knigh'tia. (Named after *J. A. Knight*, late president of the London Horticultural Society. Nat. ord., *Pro-*

teaceæ; Tribe, *Embothriaceæ*. Allied to *Lomatia*.)

Greenhouse evergreen tree. Cuttings of ripe shoots, with all the leaves on, except a few at the base of the cutting, in sandy soil, under a bell-glass, and removed in a few weeks into a mild bottom-heat; peat, with a little sandy loam, and a few broken potsherds. Winter temp., 35° to 45°. In summer the pots should be shaded:

K. exce'lsa. 10. Flesh. New Zealand. 1821. Linn. Trans. x. t. 20.

Knigh't's Star. *Hipped'strum*.

Kniph'o'fia. (Named after *Johann Hieronymus Kniphof*, a Professor of Medicine at Erfurt in the eighteenth century. Nat. ord., *Liliaceæ*; Tribe, *Hemerocalleæ*. Syn., *Tritoma*. Allied to *Blandfordia*.)

Hardy herbaceous perennials. Divisions of the plants in the spring. Ordinary garden-soil. Few plants make such a striking appearance, or can boast of so much beauty, as the late-autumn-flowering of *K. aloides*; this is a plant that should be grown in every garden, being perfectly hardy and will grow in any light soil, and moreover has the excellent quality of flowering when nearly all other plants are past. Some garden hybrids are described in Bull. Soc. Tosc. 1891, p. 81.

- K. aloides*. 3. Orange, scarlet. Autumn. S. Africa. 1707. Syn., *Tritoma wvaria*. B. M. t. 758.
 — *glaucescens*. S. Africa. 1859. Garden, 1889, xxxvi. p. 458.
 — *grandiflora*. S. Africa. 1859.
 — *ma'sima*. 5-7. Yellow. Orange Free State. 1862.
 — *serotina*. S. Africa. 1859.
 — *carnea*. 1. Apricot-yellow. Autumn. Abyssinia. 1879.
 — *caule'scens*. Red and yellow. S. Africa. 1862.
 — *com'sa*. 1-2. Yellow. August. Abyssinia. 1879. B. M. t. 6569.
 — *folio'sa*. 3. Yellow. Abyssinia. 1876. B. M. t. 6742. Syn., *K. Quartiniama*.
 — *Ki'r'kia*. 4. Reddish-orange. S.E. Tropical Africa. 1887.
 — *Leichtli'nii*. 4. Vermilion-red, yellow. August. Abyssinia. 1880. B. M. t. 6716.
 — *dista'chya*. Yellow. Abyssinia. 1884.
 — *Maco'wani*. 1. Orange-red. S. Africa. 1874.
 — *maroc'cana* is a garden corruption of the spelling of *K. Macowani*.
 — *natalesis*. 2-3. Orange-red, veined darker red. Natal. 1889.
 — *No'rthica*. 4-6. Pale yellow, reddish. South Africa. 1889.
 — *pallidiflora*. 1-2. White. Madagascar. 1887.
 — *præ'cox*. 2-3. Scarlet, yellow. Autumn. S. Africa. 1862.
 — *Quartiniama*. See *K. foliosa*.
 — *Roo'peri*. 4. Orange-red, yellow. Late autumn. British Caffaria. 1854. Syn., *Tritoma Rooperi*.

Knol-kohl, or **Kohl-rubi** (*Bra'ssica caul'lo-ra'pa*) the Turnip-stemmed Cabbage. It is sometimes called, also, the Cape Cabbage. The stem is thick, rises about eight inches out of the ground, is swollen into a globular form, very like a large Swedish turnip growing above ground, and is crowned with leaves, slightly scalloped on the edges, undulated, and milky-green, like those

of the turnip we have mentioned. There are several varieties of it; but the green-stemmed and the purple-stemmed (especially the latter) are to be preferred.

It is sweeter, more nutritious, and more solid than either the Cabbage or White Turnip; will produce a greater weight per acre than the turnip, and prefers a heavier soil than that root; is hardier, and keeps better than any other bulb; and imparts very little of that flavour, either to milk or butter, known as *turnippy*. So much relished is it both by cows and sheep, that they will leave either turnips or cabbages to partake of it. Hares and rabbits are so fond of it, that where they abound, Knol-kohl can scarcely be grown. It is excellent when boiled for table. Sow in the first week of March, and plant out in June in rows four feet apart, if the soil is fertile, but only three feet if the soil is less productive, and three feet from plant to plant in the rows. The plants must have the chief part of their stems left uncovered by the soil. Two pounds of seed produce enough plants for an acre. It is an excellent crop for cleaning the soil, as the width between the plants and rows enables the hoe to be efficiently used, and during a lengthened period. When blanks occur, these may be filled up from the seed-bed with fresh plants. The produce is from eighteen to twenty tons, and upwards, per acre. The bulbs may be kept sound and nutritious until very late in the spring, even much later than the Swedish turnip.

Knó'xia. (Named after *R. Knox*, a traveller, long resident in Ceylon. Nat. ord., *Rubiaceæ*; Tribe, *Knocixee*.)

Stove evergreens. Cuttings of young shoots in sand, under a glass, in April or May; peat and loam. Summer temp., 60° to 85°; winter, 50° to 60°.

K. brachyca'rpa. Pink. July. Bengal. 1818. Syn., *K. lævis*.

— *corymbo'sa.* 2-3. White or purplish. Summer. India. 1818. Syns., *K. exserta*, *K. sumatrensis*, *K. teres*, and *K. umbellata*.

— *zeyla'nica.* $\frac{1}{2}$. White. July. Ceylon. 1828.

Kœhle'ria. (In honour of *M. Kohl*. Nat. ord., *Gesneraceæ*.) See **Isoloma**.

K. hond'nsis. See *Isoloma hondensis*.

— *ignora'ta.* See *Isoloma igno'ratum*.

— *lana'ta.* See *Isoloma longipedunculatum*.

— *rupe'stris.* See *Isoloma rupe'stre*.

— *Seema'nna.* See *Isoloma Seemanni*.

Kœlenstei'nia. (Commemorative. Nat. ord., *Orchideæ*.) See **Aganisia**.

K. gram'i'nea. See *Aganisia graminea*.

— *iono'ptera.* See *Aganisia ionoptera*.

Kœlreute'ria. (Named after *Kœlreuter*, a celebrated German botanist,

the father of hybridizing plants. Nat. ord., *Sapindaceæ*; Tribe, *Sapindeæ*.)

Hardy deciduous trees. Cuttings of the root; cuttings of the young shoots under a hand-light; seeds in spring; layers in the end of summer; common soil, in a sheltered situation; beautiful in its leaves, flowers, fruit, and the mode of growing, as it gets old.

K. bipinna'ta. Bright yellow. Yunnan, China.

Rev. Hort. 1868, p. 393, fig. 93.

— *panicula'ta.* 10. Yellow. July. China. 1763. B. R. t. 330.

Kohl-rabi or **rubi.** See **Knol-kohl**.

Kola-Nut. *Co'la acumina'ta.*

Kolpako'wskia. See **Ixiolirion** *Kolpakowskianum*.

Ko'psia. (Named after *Professor Kops*. Nat. ord., *Apocynaceæ*. Allied to *Cerbera*.)

Stove evergreen shrub. Cuttings of the young shoots, getting a little firm at their base, in sand, over sandy soil, and in bottom-heat; peat and sandy loam. Summer temp., 60° to 85°; winter, 50° to 60°.

K. frutico'sa. Red. May. Pegu. 1818. B. M. t. 4220. Syn., *Cerbera fruticosa*, B. R. t. 391.

Korolko'wia. (Commemorative. Nat. ord., *Liliaceæ*; Tribe, *Tulipeæ*.) A synonym of **Fritillaria**.

K. di'scolor. A synonym of *Fritillaria Sewerzowi*, var. *bicolor*.

— *Sewerzowi.* See *Fritillaria Sewerzowi*.

Krame'ria. (Named after the two *Kramers*, German botanists. Nat. ord., *Polygalaceæ*.)

This is the intensely-astringent called *Rhathany-root* in South America. Stove evergreen shrub. Cuttings in sand, under a glass, in heat; sandy loam and fibry peat. Summer temp., 60° to 90°; winter, 48° to 60°.

K. paucifo'ra. 4. Red. Mexico. 1824.

Kreysig'gia. (Named after *Kreysig*, a German botanist. Nat. ord., *Liliaceæ*; Tribe, *Uvularieæ*. Allied to *Uvularia*.)

Greenhouse herbaceous perennial. Division of the plant in spring; light, sandy loam; requires the protection of a cold pit, or a cool greenhouse, in winter.

K. multifo'ra. 1. Rose. June. N.S. Wales. 1823. B. M. t. 3905. Syn., *Schelhammera multiflora*, B. C. t. 1511.

Ku'hnia. (Named after *Adam Kuhn*, an American botanist. Nat. ord., *Compositæ*; Tribe, *Eupatoriaceæ*. Allied to *Liatris*.)

Herbaceous perennials. Divisions in spring; sandy loam. Pretty little plants; the tenderest require a cold pit, or a greenhouse, in winter.

HARDY.

K. Crito'nia. A synonym of *K. eupatorioides*.

— *eupatorioid'es.* $\frac{1}{2}$. White. July. N. Amer. 1812.

GREENHOUSE.

K. lineari'folia. Brazil. 1829.

— *rosmarinifo'lia.* White. July. Cuba. 1828.

Ku'mquat. *Citrus japo'nica*.

Kunthia. (Named after *C. S. Kunth*, a Prussian botanist. Nat. ord., *Palmeæ*; Tribe, *Areceæ*.) See **Chamædorea**.

K. Deppæna. A synonym of *Chamædorea elegans*.
— *montana.* See *Chamædorea Lindeniana*.

Kunzea. (After *Gustav Kunze*, a botanist of Leipzig. Nat. ord., *Myrtaceæ*.)

Heath-like greenhouse shrubs, from Australia.
K. Baute'ri. 2. Red. Australia. Syn., *Calistemon macrostachyum*, B. R. 1838, t. 7.
— *corifolia.* White. Australia. Syn., *Leptospermum ambiguum*, B. C. t. 1998.
— *pomifera.* The fruits, called "Muntries," are used by the natives of Australia for making jam. G. C. 1889, v. p. 201, fig. 36.

Ky'dia. (Named after *Col. Kyd*, first director of the Calcutta Botanic Garden. Nat. ord., *Malvaceæ*; Tribe, *Malvæ*. Allied to *Sida* and *Abutilon*.)

Stove evergreen trees, with white flowers. Cuttings of half-ripened shoots in sand, under a bell-glass, and in heat; sandy peat and fibry loam, well-drained. Summer temp., 60° to 85°; winter, 50° to 60°.

K. calyc'na. 30. White. Tropical Himalayas. 1818.
— *frat'erna.* A synonym of *K. calycina*.

Kylli'ngia. (Named after *Peter Kylling*, a Danish botanist of the seventeenth century. Nat. ord., *Cyperaceæ*; Tribe, *Scirpeæ*.)

Tufted grass-like perennials. For cultivation, see *CYPERUS*, to which they are allied.

K. monocephala. Whitish. India, China, etc. 1868. Syn., *Cyperus Lacouri*.

L.

Label. The substances and shapes used in making labels are now very numerous, and their selection must depend upon the requirements and taste of the user. When required for a short time, such as when plants are sent from one locality to another, thick paper labels, about one inch wide and three inches long, will suffice. For marking seedlings small slips of deal wood, painted on one side, are useful. The name of the plant in both these cases should be written in black-lead pencil, not in ink, on account of its liability to run, when moistened, either by rain, or in watering the plants. Of those intended for more permanent use, the least satisfactory are those made of slate or porcelain, on account of the great readiness with which they chip or break. Far more

durable ones are made of zinc or galvanized iron. Where a large number are required for hanging on walls, trees, or shrubs, the most useful form is that made of a piece of zinc about four inches square, with the upper half inch or so turned down to rather more than a right angle, to allow rain and moisture to drain off, and so prevent the name, etc., being defaced. These labels are painted black with the name in white, the latter being much more conspicuous than if the colours are used in a reverse manner. Another good form is made of cast iron with raised letters. This label is oval in shape with a hole pierced near the top and another near the bottom; by means of the former it can be suspended by a piece of wire, or by both secured by screws to a stake driven into the ground. The portion of the stake driven into the ground, as well as that of wooden labels, should be first be soaked in creosote or gas-tar to assist in preventing decay.

Labe'llum, or **Lip.** The superior petal of orchids, which generally becomes inferior by the torsion of the pedicel. It generally differs much in size, form, and colour from other petals, rarely is it similar to them as in some of the Australian genera.

Labichæ'a. (Named after *M. Labiche*, a French officer. Nat. ord., *Leguminosæ*; Tribe, *Cassiæ*. Allied to *Cas* sia.)

Yellow-blossomed greenhouse evergreen shrub, from Swan River. Cuttings of half-ripened shoots in summer, in sand, under a bell-glass; peat and loam. Winter temp., 35° to 45°.

L. lanceolata. 3. Yellow. April. W. Australia. 1837. B. M. t. 6751. Syns., *L. bipunctata* and *L. diversifolia*, Paxt. Fl. Gard. t. 52.

Labi'sia. (From *labis*, a spoon; the divisions of the corolla are in the shape of small spoons. Nat. ord., *Myrsinæ*; Tribe, *Eumyrsinæ*.)

Stove shrubs, requiring a rather moist atmosphere. Sandy loam with a little peat. Seeds.

L. ala'ta. White, pinkish outside. Borneo and Malacca. Ill. Hort. t. 605.

— *Malouia'na.* 1. Leaves dark green, midrib lighter, under surface purplish. Borneo. 1885. Ill. Hort. t. 580.

— *potho'na.* 1. White. June. Borneo and Singapore. B. R. 1845, t. 48.

La'blab. (The Arabic name of the convolvulus; referring to the twining habit. Nat. ord., *Leguminosæ*; Tribe, *Phaseoleæ*.) See **Dolichos**.

L. perennans and *L. vulgaris*, with its varieties, *albiflora* and *purpurea* (B. R. t. 830), are forms of *Dolichos Lablab*.

Labrador Tea. *Le'dum*.

Laburnum. (The Latin name for the tree. Nat. ord., *Leguminosæ*; Tribe, *Genistæ*. Allied to *Cytisus*.)

Hardy ornamental trees.

- L. A'dami*. Purple. Syn., *Cytisus Adami*. This is a very remarkable graft hybrid raised by Jean Louis Adam in 1825, by shield grafting *Cytisus purpureus* on *Laburnum vulgare*. Mr. Adam states that all the eyes of the shield grew, but one produced a more robust shoot than the rest; this shoot he propagated, and from it all the plants of *L. Adami* are descended.
- *pe'ndulus*. A form with pendent branches. 1871.
- *alpi'num*. 15-20. Yellow. June. Europe. 1596. Scotch Laburnum. Syn., *Cytisus alpinus*. *Cytisus fragrans* and *C. hirsutus* are forms of this.
- *Alsche'ngeri*. A form of *L. alpinum* with long racemes.
- *carama'nicum*. 3-4. Yellow. June. Asia Minor. 1879. Syn., *Podocytisus caramanicus*.
- *sero'tinum*. Yellow. June. 1854.
- *vulga're*. 20. Yellow. May. Switzerland. 1596. Syn., *Cytisus Laburnum*. There are numerous varieties of this, such as: *aureum*, *bullatum*, *Carrieri*, *fragrans*, *involutum*, *monstrosum*, *Parkei*, *pendulum*, *quercifolium*, *sessilifolium*, *Watereri*, etc. See Wien. Gart. Zeit. 1884, p. 467.

Labyrinth is an arrangement of walks, inclosed by hedges or shrubberies, so intricate as to be very difficult to escape from. From the twelfth century to the end of the seventeenth they were a very favourite portion of English pleasure-ground: but they are now more judiciously banished.

Lacæ'na. (One of the names of Helen. Nat. ord., *Orchidææ*; Tribe, *Vandææ-Cyrtopodiææ*. Allied to *Govenia*.)

Divisions in spring, or after blooming; turfy peat, sphagnum, rotten wood, charcoal, and broken crocks; fixed to a block, and that built above the surface of a pot, and packed with the above material, or grown in a shallow, open basket. Summer temp., 60° to 90°, and moist; winter, 55° to 60°, and dry.

- L. bi'color*. 1. Greenish-yellow. May. Guatemala. 1843.
- *specta'bilis*. $\frac{1}{2}$. Pinkish-white, dotted with purple. May. Mexico. 1853. B. M. t. 6516.

Laca'thea flo'rida. Salis. Parad. t. 56. A synonym of **Gordonia pubescens**.

Lace-bark. *Lage'tta lintca'ria*.

Lacepe'dea. (In honour of Count de Lacepède, a French Professor of Natural History. Nat. ord., *Sapindaceæ*; Tribe, *Staphyleæ*.) See **Turpinia**. *L. insi'gnis*. B. M. t. 4459. See **Turpinia insi'gnis**.

Lachena'lia. (Named after *M. de*

la Chenal, a botanical author. Nat. ord., *Liliacææ*; Tribe, *Scilleæ*. Allied to *Triteleja*.)

All greenhouse bulbs, from South Africa, except *glau'ca*. Offsets at potting period, and seeds in a hotbed, in spring; sandy peat, with a little fibry loam. Winter temp., 35° to 45°, and dry, or the bulbs may be kept in drawers or bags. They are very beautiful little plants, and grow freely under the above conditions, potting them whenever growth commences, and watering so long as the leaves are green, but no longer; when the pots are full of roots they stand gentle forcing. The small species require sand round their bulbs, whether in the border or pots.

- L. angu'i'nea*. 1. White. April. 1825. Swt. Fl. Gard. ser. 2, t. 179.
- *angusti'folia*. Jacq. Ic. t. 381. See *L. contaminata*.
- *au'rea*. $\frac{1}{2}$. Yellow. S. Africa. 1856. B. M. t. 5992. Syn., *L. tricolor*, var. *aurea*.
- *au'reo-refle'xa*. Bright yellow, green, reddish-brown. Garden hybrid. 1887.
- *bifo'lia*. B. M. t. 1611. See *L. isopetala*.
- *Bowie'na*. $\frac{1}{2}$. Yellow, tinged with red.
- *Come'sii*. Garden hybrid between *L. reflexa* and *L. quadricolor*. Gfl. 1891, p. 358, fig. 77.
- *contamina'ta*. $\frac{1}{2}$. Pink. March. 1774. B. M. t. 1401. Syns., *L. angustifolia* and *L. hyacinthoides*.
- *fistulo'sa*. $\frac{1}{2}$. White, tinged with sky-blue. Cape Colony. 1884.
- *fla'va*. $\frac{1}{2}$. Yellow. May. 1790.
- *fra'grans*. 1. White, red. April. 1798. Andr. Rep. t. 302. *L. fragrans*, of Jacq. H. Schoenb. t. 82, is a variety of *L. versicolor*.
- *glau'ca*. Purple, red. May. Persia. 1825.
- *glau'ci'na*. 1. Green, white. May. 1795. Jacq. Ic. t. 391. Syn., *L. sessiliflora*.
- *hyacinthoi'des*. Jacq. Ic. t. 382. See *L. contaminata*.
- *isope'tala*. $\frac{3}{4}$. White, purple. May. 1804. Jacq. Ic. t. 401. Syns., *L. bifolia* and *L. rosea*.
- *lanca'fo'lia*. $\frac{1}{2}$. White, green. May. 1818.
- *lilaci'na*. $\frac{1}{2}$. Bright lilac, blue at base. 1884.
- *libi'flora*. $\frac{1}{2}$. White. May. 1825. Jacq. Ic. t. 387.
- *lu'cida*. $\frac{1}{2}$. Pink. April. 1798. B. M. t. 1372. Syn., *L. pallida* of B. R. t. 287.
- *lute'ola*. Jacq. Ic. t. 395. See *L. tricolor*.
- *media'na*. 1. White, blue. Jacq. Ic. t. 392.
- *muta'bilis*. Swt. Fl. Gard. ser. 2, t. 129. See *L. orchioïdes*.
- *Nelso'ni*. Lemon-yellow, green, red. Garden hybrid between *L. aurea* and *L. luteola*. 1882. Fl. Mag. t. 452.
- *nervosa*. $\frac{3}{4}$. Pink. June. 1810. B. M. t. 1497.
- *odorati'ssima*. $\frac{1}{2}$. White, with green tips. 1884.
- *orchioï'des*. 1. Green, white. March. 1752. Jacq. Ic. t. 390. Syns., *L. mutabilis* and *Orchidiastrum Aitoni*.
- *orthope'tala*. $\frac{1}{2}$. Reddish. Jacq. Ic. t. 392.
- *pa'lida*. $\frac{1}{2}$. Pale blue. May. 1782. B. M. t. 1269 is a synonym of *Orchidiastrum viventi-flavum*; B. R. t. 287 of *L. lucida*.
- *cærule'scens*. $\frac{1}{2}$. Bluish. September. 1782. B. R. t. 1945.
- *mi'nor*. $\frac{1}{2}$. Pale blue. 1782. B. R. t. 1350.
- *pa'tula*. $\frac{3}{4}$. White, pink. April. 1795. Jacq. Ic. t. 384.
- *pe'ndula*. $\frac{3}{4}$. Red, yellow. April. 1789. Jacq. Ic. t. 400.
- *aurelia'na*. Red. Garden variety. Rev. Hort. 1890, p. 376.

- L. pendula maculata*. $\frac{1}{2}$. Red, yellow. April. 1789.
 — *punctata*. Jacq. Ic. t. 397. See *L. rubida*, var. *punctata*.
 — *purpurea*. Jacq. Ic. t. 393. See *L. versicolor*, var. *purpurea*.
 — *purpureo-caerulesca*. 1. Purple. April. 1789. Jacq. Ic. t. 388.
 — *pusilla*. $\frac{1}{2}$. White. June. 1825. Jacq. Ic. t. 385.
 — *pustulata*. 1. Purple, green. February. 1790. Jacq. Ic. t. 386.
 — *quadricolor*. Jacq. Ic. t. 396. See *L. tricolor*.
 — *lutea*. B. M. t. 1704. See *L. tricolor*, var. *lutea*.
 — *racemosa*. $\frac{1}{2}$. White, green. May. 1811. B. M. t. 1517.
 — *reflexa*. $\frac{1}{2}$. Bright yellow, tipped with green. 1833.
 — *Regelia*. Garden hybrid between *L. reflexa* and *L. aurea*. Gf. 1891, p. 356, fig. 76.
 — *rosea*. Andr. Rep. t. 296. See *L. isopetalata*.
 — *rubida*. $\frac{1}{2}$. Red. September. 1803. Jacq. Ic. t. 398.
 — — *punctata*. Pale red, spotted with dark red.
 — — *tigrina*. Syn., *L. tigrina*. Jacq. Ic. t. 399.
 — *serotina*. See *Dipsadi serotinum*.
 — *sessiliflora*. Andr. Rep. t. 460. See *L. glauca*.
 — *tigrina*. Jacq. Ic. t. 399. See *L. rubida*, var. *tigrina*.
 — — *Warei*. Red, yellow, green. 1884.
 — *tricolor*. 1. Red, yellow. April. 1774. B. M. t. 82. Syn., *L. quadricolor*.
 — — *lutea*. Yellow. Syn., *L. quadricolor*, var. *lutea*, and *L. aurea*.
 — *unicolor*. Jacq. Ic. t. 389. See *L. versicolor*, var. *unicolor*.
 — *unifolia*. White, blue. March. 1795. B. M. t. 766.
 — *versicolor unicolor*. $\frac{1}{2}$. Pink. May. 1806. Syn., *L. unicolor*.
 — *violacea*. 1. Violet. March. 1795.

Lachnæa. (From *lachne*, down; referring to the downy clothing of the flower-heads. Nat. ord., *Thymelacæe*; Tribe, *Euthymeleæ*. Allied to *Gnidia*.)

Greenhouse evergreen shrubs, from South Africa, and all but one white-flowered. Cuttings of short young shoots in sand, under a bell-glass, in spring; sandy peat, with a little fibry loam. Winter temp., 35° to 45°. In summer, a sheltered, somewhat shady place.

- L. buxifolia*. 2. May. 1800. Syn., *L. buxifolia*, var. *virens*. B. M. t. 1657.
 — — *glauca*. 2. June. 1800. B. M. t. 1658. Syn., *L. glauca*.
 — *conglomerata*. 2. June. 1773. A synonym of *Passerina ericoides*?
 — *ericeophala*. 2. June. 1793. B. M. t. 1295.
 — *purpurea*. 2. Purple. April. 1800. Syn., *L. purpurea*. B. M. t. 1594.
 — *glauca*. See *L. buxifolia*, var. *glauca*.
 — *purpurea*. Andr. Rep. t. 293. See *L. ericeophala*, var. *purpurea*.

Lachnanthes. (From *lachne*, down, and *anthos*, a flower. Nat. ord., *Hæmodoracæe*; Tribe, *Euhæmodoreæ*. Syn., *Gyrotheca*. Allied to *Anigozanthos*.)

Half-hardy herbaceous perennial. The red colour found in the roots is used in dyeing in North America. Division of the roots in spring; peat and loam. Winter temp., 40°.

- L. tinctoria*. $\frac{1}{2}$. Pink July N. Amer. 1812.

Lachnostoma. (From *lachne*, down, and *stoma*, a month; the throat of the corolla is downy. Nat. ord., *Asclepiadacæe*; Tribe, *Gonolobæe*.)

L. maritimum is a stove, and *L. prostratum* a greenhouse, twiner. Culture the same as for *GONOLOBUS*.

- L. maritimum*. Green, purple. June. Caracas. 1823. Syn., *Gonolobus maritimum*. B. R. t. 931.
 — *prostratum*. Green. July. Mexico. 1823. Evergreen. Syn., *Gonolobus prostratus*.

Lackey Moth. *Bo'mbyx neustria*.

Lactuca. Lettuce. (From *lac*, milk; referring to the milky juice. Nat. ord., *Compositæ*; Tribe, *Cichoracæe*. Syn., *Agathyrsus*.)

For culture, see below.

- L. alpina*. 3. Blue-purple. July. N. Europe. Perennial. Syn., *Agathyrsus alpinus* and *Mulgedium alpinum*.
 — *intybaea*. Yellow. St. Thomas. Jacq. Ic. t. 162. Syn., *Brachyramphus intybaeus*.
 — *macrophylla*. 4. Pinkish-purple. July. Caucasus.
 — *macrorrhiza*. 1-3. Violet. August. N.W. Himalayas. Perennial. Syn., *Mulgedium macrorrhizon*. B. R. 1846, t. 17.
 — *perennis*. 2. Light blue. Summer. S. Europe. 1596. B. M. t. 2130.
 — *Plumieri*. 6. Purple. Summer. S. France. Perennial.
 — *sativa*. 3. Yellow. June. 1562. Annual. Bent. and Tr. t. 161. Common Lettuce.
 — *tuberosa*. Pale bluish-purple. Persia. Jacq. H. Vind. i. t. 47.
 — *villosa*. Purple. Pennsylvania. Jacq. H. Schoenb. t. 367. Syn., *Mulgedium acuminatum*.

Varieties.—There are the *Cos* and the *Cabbage*; the first more grown in summer than in winter; the second at all seasons, but more usually in winter, on account of their superior hardihood. The *Cilicias* are of a nature intermediate between the two. When young, the *Cabbage* varieties are, in general, sweeter than those of the *Cos* at the same age; but of a full growth this is reversed. Hence the latter are preferred for salads, and the former for soups. The *Cabbage* varieties succeed better in a hotbed than the *Cos*.

Cos Varieties.—*Alexandra* White, *Bath* Black-seeded, *Moor Park*, *Sugar-loaf*, *Brighton*, *Silver*, *Black-seeded Green*, *Spotted*, or *Leopard*, *Early Egyptian*, *Green* and *Brown Cilicia*, *Green Lop*, *White*, or *Versailles*, *White Paris Cove*, the finest summer kind; *Green Paris Cove*, rather hardier; *Bath Cos*, and *Brown Cos*.

Cabbage Varieties.—All the *Year Round*, *Early Paris Market*, *Hammer-smith* *Early Green*, *Tennis Ball*, *White Dutch*, *Drum-headed*, *Prince's*, *Brown Dutch* and *Common White Dutch*, both good for winter; *Large White*, *Hardy Green*, or *Capuchin*, good for winter;

Imperial Grand Admirable, Prussian, Large Roman, Malta, for summer; Neapolitan, for summer.

Soil.—Lettuces thrive best in a light, very rich soil, with a dry substratum. For the first and last crops of the year a warm, sheltered situation is required; but for the Midsummer ones, a border that is shaded during mid-day.

Sowing.—The first sowing in a frame on a warm border, or slender hotbed, at the close of January, or early in February; at the close of this last month a larger one in any open situation, and smaller repeated once every three weeks, until the end of July, for summer and autumn use, to be continued at similar intervals until the close of September, for winter and early spring. Sow moderately thin, each variety separate.

Pricking out.—When the plants are about a month old, or two inches in height, thin them to three or four inches apart, and prick out those removed at similar distances. Those from the sowings in January and February in frames, and thence until August, in any open situation. Those of the August sowing must be divided into two portions; the largest being selected and planted in an open compartment for late autumn use, and the smaller on a warm border for winter and early spring.

Plant out, finally, in rows a foot apart each way. At the time of every removal, whether of pricking out or planting, water must be given moderately, and until the plants are rooted. It may be remarked, that transplanted lettuces never attain so fine a growth as those left where sown, nor become so soon fit for use; those which are planted out at once to remain being better in these respects than those pricked out previous to final planting. The varying in their time of becoming fit for use, however, is of advantage, as by these means a more perfect succession is obtained. Those which are planted to withstand the winter, which they easily do if sheltered with hoops and matting during severe weather, and continue in a fit state for use, are best planted on ridges, as a protection from excessive wet, from which they always suffer. In every stage of growth they must be kept well watered, and the earth around them frequently stirred, for the extirpation of slugs and snails. No vegetable is more benefited than the lettuce by the application, occasionally, of liquid-manure. To check the Cos plants running to seed before the heart is perfectly blanched, it is a good practice, at the time of tying them

up, to cut out the centre bud of each with a sharp knife.

Frame Crops.—The plants raised from the September sowing may be divided as directed for those of August; but, in addition, some of the Cos varieties may be planted on a warm border, to have the shelter of frames and hand-glasses. Some of the strongest of these may, in succession during November, December, and January, be planted in a moderate hotbed, being removed with as little injury as possible to the roots, to bring them forward for immediate use. Whilst in frames they require much attention. Being watered and shaded until established, they must afterwards have as much light and air admitted as possible, as well as a regular supply of moisture.

At night the additional shelter of matting, and in severe weather an increased covering, must be afforded. The day temperature should never exceed 80°: nor fall below 65°. The plants may be set in rows about six inches apart; but of those which are merely sheltering during the winter, on the return of mild weather, at the beginning of March or April, every second one must be carefully removed, and planted in a warm border at the usual open-ground distance.

To obtain Seed.—Some of the finest and most perfect plants of each variety that have survived the winter, or from the forwardest sowing of the year, should be selected. The seed from any that have run up prematurely cannot be depended upon. If two varieties flower near each other, only mongrel varieties will be obtained. Each stem is to be tied to a stake as a support against tempestuous weather. The branches must be gathered as the seed ripens upon them. It must be thoroughly dried before it is stored.

Disease.—Yellowish spots are sometimes found on the upper surface of the leaves, caused by a species of mildew, *Peronospora ganglioniformis*. As this fungus passes part of its life on other genera of Composites, such as Thistles, Groundsel, etc., the latter should be weeded from the lettuce-bed as soon as they appear.

Insect.—*Anthomyia lactuæ*, deposits its eggs on the flowers of lettuce plants left to produce seeds. The larvæ commit great havoc by boring into, and eating the seeds. The surest way to get rid of this pest is to burn the crop, as soon as it is discovered to be attacked. The male fly is black, with four pale stripes on the thorax, and a chestnut-

brown head; the female grey, with blackish legs.

Lady-Bird. *Coccine'lla*.

Lady's Fern. *Lastrea a thely'pteris*.

Lady's Laces. *Aru'ndo*.

Lady's Mantle. *Alchemi'lla*.

Lady's Slipper. *Cypripe'dium*.

Lady's Smock. *Cardami'ne*.

Lady's Tresses. *Neot'tia spir'al'is* and *Spira'nthes*.

Lælia. (*Lælia* was a Vestal virgin; alluding to the delicacy of the flower. Nat. ord., *Orchidæe*; Tribe, *Epidendrea-Lælicæ*. Allied to *Epidendrum*.)

Stove orchids. Divisions; turfy peat, chopped old moss, and charcoal, raised above the surface of a pot, filled with drainage, or a block of wood firmly laid across. Treatment similar to CATTLEYA.

Lælioca'ttleya. (A name used for hybrids between the genera *Lælia* and *Cattleya*. Nat. ord., *Orchidææ*; Tribe, *Epidendrææ-Læliææ*.)

For culture, see LÆLIA.

- L. Arnoldia*'na. Hybrid between *Lælia purpurata* and *Cattleya labiata*. 1891.
 ——— *bell'a*. Lilac, purple, white.
 ——— *Hippoly'ta*. Hybrid between *Cattleya Mossiae* and *Lælia cinnabarina*. Journ. Hort. 1890, xx. p. 302, fig. 38.
 ——— *Proserpi'ne*. Hybrid between *Lælia pumila*, var. *Dayana* and *Cattleya velutina*.

Lælio'psis. (From *Lælia* and *opsis*, resemblance. Nat. ord., *Orchidæ*; Tribe, *Epidendrea-Lælicæ*.)

Stove epiphytal orchid. See ORCHIDS.

L. domingensis. Purple. July. St. Domingo. 1851. Paxt. Fl. Gard. iii. p. 155. t. 105.

Lafœnsia. (Named in honour of the Duke of Lafoens, president of the Lisbon Academy of Science. Nat. ord., *Lythraceæ*; Tribe, *Lythreæ*. Allied to *Lagerstroemia*.)

A stove shrub. Cuttings of rather ripe wood in autumn, in sand, and in bottom-heat; peat and loam. Summer temp., 60° to 90°; winter, 50° to 55°, and kept rather dry. Prune freely in winter.

L. microphylla. Brazil. 1847. Syn., *L. Vandeliana*.

Laga'scea. (Named after D. M. Lagasca, professor of botany at Madrid. Nat. ord., *Compositæ*; Tribe, *Helianthoidæ*.)

Stove plants. Raised in a hotbed, several times potted there, and bloomed in summer, in a greenhouse or plant stove.

L. latifolia. 10-15. White. June. Mexico. Shrub. Syn., *Nocca latifolia*. Swt. Fl. Gard. t. 215.

— *molliis.* 2. White. July. Cuba. 1815. B. M. t. 1804. Annual.

Lagenaria. Bottle Gourd. (From *lagna*, a bottle; referring to the shape of the fruit of some species. Nat. ord., *Cucurbitaceæ*; Tribe, *Cucumerinæ*. Allied to *Cucumber*.)

Hardy annuals, from the East Indies, and yellow-flowered, except where otherwise specified. Seeds in a hotbed, and either fruited there, or hardened off and cultivated out of doors, under hand-lights, against palings and other fences; rich light soil. For culture, see CUCUMBER.

L. idolotrica. White. June.

— *verrucosa.* Wien. Gart. Zeit. 1889, p. 459.

— *vittata.* White. June.

— *vulgaris.* 10. August. 1597. Cultivate throughout the tropics and warm temperate zones.

— *clavata.* 10. August. 1597.

— *courgourda.* 10. August. 1597.

— *depressa.* 10. August. 1597.

— *turbinata.* 10. August. 1597.

Lagenophora. (From *lagenos*, a bottle, and *phoros*, to bear; referring to the flower-heads. Nat. ord., *Compositæ*; Tribe, *Asteroidæ*. Allied to *Brachycome*.)

Greenhouse herbaceous perennial. Division in spring; light soil; a cool greenhouse, or a dry, cold pit in winter.

L. Forsteri. Yellow and purple. New Zealand. 1837.

Lagerstroemia. (Named after M. Lagerström, a German. Nat. ord., *Lythraceæ*; Tribe, *Lythreæ*.)

Cuttings of small, firm side-shoots in spring, under a bell-glass, and cuttings of ripened shoots in autumn, in strong bottom-heat; peat and

loam. Summer temp., 60° to 90°, with plenty of moisture, both at the root, and also at the top, except when in flower. Winter temp., 55° to 60°, and dryish, after being pruned in autumn. The greenhouse species require only warm greenhouse temperatures.

GREENHOUSE EVERGREEN SHRUBS.

L. indica alb. 12. White. August. China. 1816.

— *rosea.* 12. Rose. August. China. 1825.

— *speciosa.* Rose. August. China. 1826.

STOVE EVERGREEN SHRUBS.

L. elegans. 10. Rose, yellow. August. E. Ind.

1841. Paxt. Mag. xiv. p. 269.

— *Flores-reginæ.* 12. Rose to purple. Malacca to China. 1792. Syn., *L. reginæ*.

— *grandiflora.* 12. Red. July. E. Ind. 1818.

Syn., *Duabanga sonneratioides*.

— *indica.* 6. Flesh. July. E. Ind. 1759.

B. M. t. 405.

— *parviflora.* 12. White. E. Ind. 1818.

— *reginæ.* See *L. Flores-reginæ*.

Lage'tta. Lace Bark. (Its Indian name. Nat. ord., *Thymelacææ*; Tribe, *Euthymelacææ*.)

The inner bark of this stove evergreen is the beautiful Lace Bark of the West Indies. Cuttings of half-ripened shoots in sand, under a glass, and in bottom-heat, in April or May; peat and fibry loam. Summer temp., 60° to 80°; winter, 45° to 55°.

L. linearia. 6. White. Jamaica 1793. B. M. t. 4502.

Lagunæ'a. See *Lagunaria*.

Laguna'ria. (From its resemblance to *Lagunæa*, an allied genus. Nat. ord., *Malvaceæ*; Tribe, *Hibisceæ*. Syn., *Lagunæa*.)

Greenhouse evergreen shrubs. By cuttings of half-ripened shoots in sand, under a glass, and in heat, in May; peat and loam. Winter temp., 40° to 45°.

L. cuneiformis. A synonym of *Fugosia cuneiformis*.

— *ilicifolia.* Lilac. June. Swan River. 1832.

A synonym of *Fugosia hakeaefolia*, var. *coronopifolia*. Syn., *Hibiscus ilicinus*. E. R. t. 2009.

— *Patersonii.* 20. Pale red. June. Norfolk Island. 1792. Syns., *Lagunæa Patersonii*, B. M. t. 769, *L. squamea* and *Hibiscus Patersonius*, Andr. Rep. t. 236.

Laguncularia. (Derivation uncertain. Nat. ord., *Connaracææ*; Tribe, *Connaracææ*.)

Stove evergreen shrub. The bark is used for tanning in Brazil. For culture, see CONNARUS.

L. racemosa. 10. White. Brazil. 1820. Syn., *Conocarpus racemosus*.

Lagu'rus. Hare's-tail Grass. (From *lagos*, a hare, and *oura*, a tail. Nat. ord., *Graminææ*.)

Hardy annual grass.

L. ovalis. 1. June. W. Europe, Britain. Eng. Bot. ed. 3, t. 1712.

La'lage. (Named after *Lalage*, a gay, witty dame immortalized by Horace. Nat. ord., *Leguminosææ*; Tribe, *Genisteææ*. United by some authors with *Boissiaææ*. Allied to *Platylobium*.)

Greenhouse evergreen shrubs, from Australia. Cuttings of the young shoots when they are getting firm; seeds in a slight, sweet hotbed, and seedlings gradually hardened; sandy peat, with a little fibry loam, broken crocks, and charcoal, and extra draining; in summer, a very airy greenhouse. Winter temp., not below 45°.

L. hoveaefolia. 2. Yellow, orange. March. 1841.
— *ornata*. 2. Yellow, purple. April. 1830.
B. R. t. 1722. Syn., *Boissæa ornata*.

Lallema'ntia. (After *J. E. Lalle-
mant*, of St. Petersburg. Nat. ord.,
Labiata.)

Hardy biennial. For culture, see DRACO-
CEPHALUM.

L. canescens. 1½. Blue. July. Levant. 1711.
Syn., *Dracocephalum canescens*.

Lama'rkia. (In honour of *J. B.
Lamarck*, a French naturalist. Nat.
ord., *Gramineæ*.)

Hardy annual grass. Propagated by seeds in
spring.

L. aurea. S. Europe and N. Africa.
— *dentata*. A synonym of *Elaeodendron australe*.

Lambe'rtia. (Named after the late
Mr. Lambert, a distinguished patron of
botany. Nat. ord., *Proteaceæ*; Tribe,
Grevilleæ. Allied to *Hakea*.)

Greenhouse evergreen shrubs, from West Aus-
tralia. Cuttings of the ripened shoots, before
fresh growth commences, in the spring, in sand,
over sandy peat, in pots nearly filled with
drainage, and covered with a bell-glass, and kept
close and cool until the base of the cutting
swells, when a little bottom-heat may be applied;
sandy loam and fibry peat, well-drained, and
mixed with rough pieces of charcoal. Winter
temp., 38° to 45°.

L. echinata. 3. July. 1824.
— *formosa*. 4. Red. July. 1788. B. R. t. 528.
— *longifolia*. 4. Red. July. 1826.
— *multiflora*. Orange.
— *ovalifolia*. 1836.
— *propinqua*. 1830.

Lamb's Lettuce. See **Corn
Salad.**

La'mium. Dead Nettle. (A name
used by *Pliny*. Nat. ord., *Labiata*;
Tribe, *Stachydeæ*. Syn., *Galeobdolon*.)

Perennial herbs of little value. Seeds.

L. Galeobdolon. 1. Yellow. May. Europe.
Syn., *Galeobdolon luteum*. Eng. Bot.
ed. 3, t. 1085.
— *maculatum*. 1. Purple. Summer. Europe.
Eng. Bot. ed. 3, t. 1087.

Lamourou'xia. (Named after *J.
V. F. Lamouroux*, a naturalist. Nat.
ord., *Scrophulariaceæ*; Tribe, *Euphra-
sievæ*. Allied to *Bartsia*.)

Greenhouse herbaceous perennials, scarlet-
flowered, from Mexico. For culture, see ANGE-
LONIA.

L. cordata. See *L. viscosa*.
— *multifida*. 1½. 1846.
— *viscosa*. 1½. 1846. Syn., *L. cordata*.

Lamproc'cus. (From *lampros*,
brilliant, and *kokkos*, a berry; on account
of the shining fruit. Nat. ord., *Brome-*

liacæ; Tribe, *Bromeliææ*.) See **Æch-
mea.**

L. cœrulea. Gfl. t. 694. See *Æchmea
cœrulescens*.
— *Vallera'ndi*. Rev. Hort. 1877, p. 130. See
Streptocalyx Vallera'ndi.
— *Weilbachii*. B. M. t. 6435. See *Æchmea
Weilbachii*.

Lampro'nia rubic'ella. See **Rasp-
berry moth.**

Lampwick. *Phlo'mis lychni'tis*.

Lana'ria. (From *lana*, wool; the
perianth is woolly outside. Nat. ord.,
Hæmodoracææ. Syn., *Argolasia*.)

Herbaceous greenhouse perennial. Sandy
loam and peat, with plenty of moisture. In-
creased by dividing the root.

L. plumosa. 1½. White. May. South Africa.
1787. Syn., *Argolasia plumosa*.

Lance-wood. *Guatte'ria*.

Land-ditching. See **Draining.**

Landra. *Rapha'nus la'ndra*.

Landscape Gardening, as its
name intimates, is the composition of
beautiful scenery, so that all artifice is
concealed by the blending of trees, shrubs,
ground, and water; thus forming vistas
as gratifying as those which occur natu-
rally. Admiration for such scenery is
an innate quality of the human mind;
and successfully to imitate such scenery
requires judgment as well as taste. It
is not possible, without a heavy outlay,
to introduce any desired species of land-
scape beauty upon a given plot of ground.
There is the beauty of the level surface,
quite unattainable without such outlay,
upon a surface which is abrupt and
broken. The beauty of the clay dis-
tricts is not otherwise to be secured upon
those of the chalk; neither on light
uplands can be arranged the dense
beauties of well-watered, alluvial vales.
"Consult the genius of the place" is an
axiom which has been derided, but which
is dictated by the soundest sense.

Under this general head we have not
space to enter fully into details; but
some of these will be found, under their
appropriate titles, in other pages, and
chiefly borrowed from *Mr. Whately*, who
has published more correct views upon
the art of tastefully arranging grounds
than most men who have written upon
the subject.

La'nium. (Probably from the native
name. Nat. ord., *Orchidææ*; Tribe,
Epidendræ-Stenoglosseæ.)

Stove orchid.

L. microphyllum. Dull pink or greenish.
Guiana. Ic. Pl. t. 1334.

Lankeste'ria. (Named after *Dr. E.
Lanckester*, a distinguished botanist.

Nat. ord., *Acanthaceae*; Tribe, *Ruellieae*. Allied to *Eranthemum*.)

Stove evergreen shrubs, from Sierra Leone. Cuttings of young shoots in sandy soil, in heat, in spring; peat and loam, well drained. Summer temp., 60° to 85°; winter, 48° to 58°.

- L. Bartschi*. Primrose yellow, with orange eye. W. Africa. 1865. B. M. t. 5533.
 — *elegantis*, is *Eranthemum elegans*.
 — *hispida*. Yellow. April. 1844. Syns., *L. longiflora* and *L. parviflora*.
 — *parviflora*. B. R. 1846, t. 12. See *L. hispida*.

Lansbergia. (In honour of M. R. van Lansberg, who introduced the plant. Nat. ord., *Iridaceae*; Tribe, *Sisyrinchieae*.) See **Trimezia**.

- L. caracasana*. See *Trimezia lurida*.
 — *martinicensis*. See *Trimezia lurida*.

Lanta'na. (An ancient name for Viburnum. Nat. ord., *Verbenaceae*; Tribe, *Verbeneae*.)

Stove evergreen shrubs. Cuttings of the short side-shoots, two inches in length, taken off close to the old wood, when fresh growth commences, in spring; fibry loam and a little peat; *Sellowia* na requires sandy peat. Summer temp., 60° to 85°; winter, 45° to 55°.

- L. aculeata*. See *L. mixta*.
 — *alba*. White, yellow. Syn., *Lippia purpurea*.
 — *braziliensis*. 3. White. June. Brazil. 1823.
 — *coccinea*. 3. Scarlet. June. S. Amer. 1824.
 — *crocea*. 4. Copper. June. Jamaica. 1818. Jacq. H. Schoenb. t. 473.
 — *delicatissima*. Rev. Hort. 1852, p. 461.
 — *fuca* ta. B. R. t. 798. See *L. lilacina*.
 — *hispida*. 3. Purple. July. Mexico. 1824.
 — *hirsuta*. 3. Red. June. Mexico. 1824.
 — *involuta* ta. 3. Pink. July. W. Ind. 1690. Syns., *L. incana* and *L. lanuginosa*.
 — *lavandula* cea. Jacq. H. Schoenb. t. 361. See *Lippia asperifolia*.
 — *lilacina* na. 1-2. Rose. St. Salvador. 1823. Syn., *L. fuca* ta. B. R. t. 798.
 — *missifolia* ta. 2. Yellow. August. W. Ind. 1732.
 — *mixta*. 10. White, changing through yellow and orange to red. June. Rio Janeiro. 1692. Syns., *L. aculeata* and *L. mutabilis*.
 — *molle* is. 4. Red, white. July. Mexico. 1828.
 — *multiflora*. 1834.
 — *mutabilis*. Rev. Hort. 1852, p. 461. See *L. mixta*.
 — *nova mutabilis*. 5. Yellow, rose. May. B. M. t. 3110.
 — *odorata* ta. 2. White. May. W. Ind. 1758. Syn., *L. recta*. Jacq. H. Schoenb. t. 360.
 — *pilosca*. 3. Purple. July. Cuba. 1823.
 — *purpurea*. 2. Purple. July. S. Amer. 1820. Syn., *L. albo-purpurea*.

 — *recta*. Jacq. H. Schoenb. t. 360. See *L. odorata*.
 — *salviaefolia* ta. 3. Red. June. Cape of Good Hope. 1823. Jacq. H. Schoenb. t. 285. Syn., *L. violacea*.
 — *Sellowiana* na. 1. Rose. April. Monte Video. 1828. B. M. t. 2981.
 — *lanceolata* ta. Deep rose. July. Monte Video. 1838.
 — *stricta* ta. 3. Pale purple. Jamaica. 1733. Syn., *L. angustifolia*.
 — *trifolia* ta. 3. Purple. July. W. Ind. 1733.
 — *violacea*. See *L. salviaefolia*.

Lapageria. (Named in compliment

to *Josephine Lapagerie*, first wife of Napoleon Bonaparte. Nat. ord., *Liliaceae*; Tribe, *Luzuriageae*.)

- A fine half-hardy herbaceous twiner, like a Smilax, with large, rosy flowers, like *Bomarea*.
L. rosea. Patagonia. 1847 or 1848. B. M. t. 4447.
 — *albiflora*. White. Chili. B. M. t. 4892.
 — *superba*. Bright crimson. G. C. 1878, ix. p. 139, fig. 26.

Laplacea. (Named after Laplace, the distinguished philosopher. Nat. ord., *Ternstroemiaceae*; Tribe, *Gordoniaceae*. Allied to *Bonnetia*.)

Stove evergreen twiner, attaining a height of forty feet in its native country. Cuttings of half-ripened shoots in sand, in heat, under a bell-glass; sandy peat and fibry loam, well drained. Summer temp., 60° to 85°; winter, 50° to 60°.

- L. semiserrata*. 2. White. September. Brazil. 1842. B. M. t. 4129.

Laportea. (Named after M. Laporte. Nat. ord., *Urticaceae*; Tribe, *Urticeae*. Allied to *Fleurya*.)

Stove perennials. Seeds; cuttings in sand, in bottom-heat and under a hand-glass. Rich loam and fibrous peat or leaf-mould. Summer temp., 70° to 85°; winter, 60° to 70°. Care should be taken in handling these plants, as they possess stinging hairs, which cause acute pain, and the effects last for a long period. The writer of this was on one occasion stung by a single hair of *L. gigas* upon the middle finger, which resulted in a slight form of paralysis in the whole of one side of the body for several hours, severe pain being felt under the armpit and at the elbow; in damp weather slight pain was experienced at the place stung for eighteen months afterwards.

- L. gigas*. 80. Green. New South Wales. 1874.
 — *moroides*. 2. Greenish; fruit vinous-purple. The Poison Tree of Queensland. B. M. t. 7057.
 — *Schomburgkii versicolor*. Leaves variegated. Polynesia. 1875.

Lardizabala. (In honour of M. Lardizabal y Uribe, a Spanish naturalist. Nat. ord., *Berberidaceae*; Tribe, *Lardizabaleae*.)

Hardy evergreen climber, a rapid grower, suitable for covering high walls or trellis. For cultivation, see **HOLBOLLIA**.

- L. biternata* ta. Purple. December. Chili. 1848. B. M. t. 4501.

La'rix. Larch. (A name used by Dioscorides. Nat. ord., *Coniferae*; Tribe, *Abietineae*.)

Hardy, deciduous trees. For culture, see **PINUS**.

- L. americana* na. 70-90. N. America. Syns., *Pinus microcarpa* and *P. pendula*. Black Larch.
 — *brevifolia* ta. See *L. occidentalis*.
 — *dahurica*. Siberia to Dahuria. Varying in size from a small tree to a hush.
 — *decidua*. See *L. europaea*.
 — *europaea* na. 80-100. Europe. 1629. Syns., *L. decidua*, *L. pyramidalis*, and *L. vulgaris*. Common Larch.
 — *glauca*. Leaves glaucous.
 — *pendula*. Branches drooping.
 — *sempervirens*. Leaves persisting for two or three years. 1870.

- L. Griffithii*. 30-40. Northern India. Sikkim Larch.
 — *japonica*. See *L. leptolepis*.
 — *Kämpferi*. See *Pseudolarix Kämpferi*.
 — *Ledebourii*. 80-100. Siberia. Russian or Archangel Larch.
 — *leptolepis*. 40. Japan. Syn., *Abies leptolepis* and *Larix japonica*.
 — *Lyaalii*. 40. Rocky Mountains. 1863.
 — *occidentalis*. 150. N.W. America. Syn., *L. americana*, var. *brevisfolia*, and *Pinus Nuttallii*.
 — *pyramidalis*. See *L. europaea*.
 — *vulgaris*. See *L. europaea*.

Larkspur. *Delphinium*.

Larochea. See **Rochea**.

La'rrea. (Named after a Spaniard of that name. Nat. ord., *Zygophyllaceae*. Allied to *Zygophyllum*.)

Greenhouse evergreens, from South America, with yellow flowers. Cuttings of young half-ripened shoots in sand, under a bell-glass, in summer; peat and fibry loam, with silver sand, and pieces of broken pot, and charcoal, to keep the soil open. Winter temp., 40° to 48°; summer, in a shaded position.

L. divaricata. 2. July. 1829.

— *nitida*. 2. June. 1829.

Larva. The name by which an insect is described when in the state between the egg and the chrysalis form. The larva of a butterfly or moth is commonly known as a *caterpillar*; of a fly or beetle, as a *maggot* or *grub*.

Laserwort. *Thapsia laserpitii*.

Lasia'ndra. (From *lasios*, woolly, an *aner*, an anther; and woolly stamened. Nat. ord., *Melastomaceae*; Tribe, *Osbeckieae*.) See **Pleroma**.

L. argentea. See *Pleroma holosericeum*.

— *Fontanesiana*. See *Pleroma granulosum*.

— *lepidota*. See *Pleroma barbigerum*, var. *lepidota*.

— *maerantha*. See *Pleroma semidecandrum*.

— *petiolata*. B. M. t. 3766. See *Pleroma Gau-daudinianum*.

Lasiogro'stis. (From *lasios*, woolly, and *agrostis*, grass. Nat. ord., *Gramineae*.)

Hardy grass.

L. Calamagrostis. 2-3. South Europe.

Lasiopetalum. (From *lasios*, woolly, and *petalon*, a petal, or flower-leaf. Nat. ord., *Sterculiaceae*; Tribe, *Lasiopetaleae*.)

Greenhouse evergreen shrubs, from Australia. Cuttings of half-ripened shoots in sand, under a glass, in April and May; sandy peat and fibry loam, well drained, and carefully watered; either stagnant moisture or a sour soil destroys them. Winter temp., 40° to 45°.

L. arboreascens. See *Seringia platyphylla*.

— *Baueri*. See *Gaichenotia ledifolia*.

— *bracteatum*. 3. Pink. April. 1844. Syn., *Corethrostylis bracteata*. B. R. 1844, t. 47.

— *ferrugineum*. 4. White. June. 1791.

— *macrophyllum*. 5. Pale green. May. 1825.

— *purpureum*. B. M. t. 1755. See *Thomasia purpurea*.

— *triphylum*. See *Thomasia triphylla*.

Lasiosper'mum. (From *lasios*, woolly, and *sperma*, a seed. Nat. ord., *Compositae*; Tribe, *Anthemideae*. Allied to *Santolina*.)

Half-hardy evergreen trailing plants, with yellow flowers. Divisions in spring, and cuttings under a hand-light, in a shady place, in summer; common garden-soil. Most of them require the protection of a cold pit in winter. The Italian species are most hardy.

L. anthemoides. 1. August. Italy. 1729.

— *crithmifolium*. 1. August. Macedonia. 1817.

— *eriosper'mum*. See *Scorzonera eriospermum*.

— *peduncularre*. 1. July. S. Africa. 1798.

— *rigidum*. 1. August. Greece. 1816.

Lasiorhi'za. (From *lasios*, woolly, and *rhiza*, root. Nat. ord., *Compositae*; Tribe, *Mutisiaceae*.) See **Leuceria**.

L. ro'sea and *runcinata*. See *Leuceria runcinata*.

Lasthe'nia. (Derivation not explained. Nat. ord., *Compositae*; Tribe, *Helenoideae*.)

Hardy annuals, with yellow flowers. Seeds in October, and plants protected by boughs of evergreens during the winter; or sow in March and April in the open border.

L. californica. 1. May. California. 1834. B.

R. t. 1780. (*L. glaberrima*.) A small form of *L. glabrata*.

— *glabrata*. 1. May. California. 1834. B.

R. t. 1823. Syn., *Hologyne glabrata*.

— *obtusifolia*. 1. May. Chili. 1833.

Lastræ'a. (Derivation unexplained. Nat. ord., *Filices*.) By some authors regarded as a section of **Nephrodium**.

For culture, see **FERNS**. They have all yellowish spores.

HARDY.

L. aculeata. 2. June. Britain.

— *aristata variegata*. Japan. 1879.

Lata'nia. Bourbon Palm. (The Bourbon name is *Latanier*. Nat. ord., *Palmææ*.)

Stove palms, with greenish-white flowers. Seeds in a hotbed; rich, loamy soil. Summer temp., 60° to 90°; winter 55° to 60°.

- L. au'rea*. Lee L. *Verschaffeltii*.
 — *borbo'nica*. See *Livistona chinensis*.
 — *Commerso'nii*. 7. Mauritius and Bourbon. 1773. Syn., *L. rubra*.
 — *glaucophy'lla*. See *L. Loddigesii*.
 — *Loddige'sii*. 10. Round Island. 1823. Syn., *L. glaucophy'lla*.
 — *ru'bra*. See *L. Commersonii*.
 — *Verschaffe'tii*. 7. Rodriguez Island. Syn., *L. aurea*.

Laterals, or Side-Shoots, are those which spring from the sides of the main branches, and are thus described in contradistinction to the terminal or leading shoots of the branches:—The laterals on the lower branches, like those branches themselves, are usually longer as they approach the base of the tree, because they extend to obtain the benefit of the light kept from them by the branches above. If unable thus to extend, as in

the case of inner trees of those planted in clumps, the laterals die, and occasion the nakedness of their trunks. If the terminal shoot of a branch be cut away, the laterals increase more in length, not only because more sap is thus afforded them, but because an extra effort is made to advance into the desired degree of light.

Lathræ'a. (From *lathraios*, hidden; the species grow concealed beneath trees and shrubs. Nat. ord., *Orobanchææ*.)

Half-hardy, herbaceous, root-parasites. For culture, see OROBANCHE.

L. claud'e'stina. ½. Violet-purple. April. Europe. 1890. B. M. t. 7106.

— *squama'ria*. 1. Flesh-coloured, sometimes tinged with blue. May. Europe, England.

La'thyrus. (From *la*, to add to, and *thouros*, an irritant; to increase excitement, the supposed qualities of the seeds. Nat. ord., *Leguminosæ*; Tribe, *Viciææ*.)

Seeds of annuals, in common soil, in spring; perennials, by division at the same time, or cuttings of the young shoots under a bell-glass; common garden-soil.

HARDY ANNUALS.

L. amphica'rupus. 1½. Pink. June. Levant. 1680. Swt. Fl. Gard. t. 236.

— *angula'tus*. 1. Red. June. South Europe. 1683.

Lattice-leaf Plant. *Ouviraandra fenestralis*.

La'tua. (From *Latue*, the native name. Nat. ord., *Solanaceæ*; Tribe, *Solanaceæ*.)

Half-bardy shrub. For culture, see LYCIUM.

L. venosus. 4. Deep purple. February. S. Chili. 1863. Syn., *Lycioplestium pubiflorum*. B. M. t. 5373.

Lauge'ria. A synonym of *Guettarda*.

Laurel. *Laurus*.

Laurel Cherry. *Cerasus lauro-cerasus*.

Laure'lia. (From *Laurus*, the bay-tree; the leaves have a similar odour. Nat. ord., *Monimiaceæ*.)

Greenhouse tree, propagated by cuttings. Loam and peat equal parts.

L. novæ-zelandiæ. 150. New Zealand.

Laurentia. (After *M. A. Laurenti*, an Italian botanist. Nat. ord., *Campanulaceæ*.)

Greenhouse stemless herbs.

- L. erinoides*. Purple, white. August. South Africa. 1759. Syn., *Lobelia erinoides*. B. M. t. 3609.
 — *minuta*. Pale purple. Summer. South Africa. Syn., *Lobelia minuta*. B. M. t. 2590.

Lauresti'nus. *Viburnum laurustinus*.

Lau'rus. Laurel. (From the Celtic *blaur* or *laur*, green. Nat. ord., *Lauraceæ*; Tribe, *Litseaecæ*.)

The Bay (*Laurus nobilis*) represents this large order. They are all more or less aromatic, and produce camphor, cinnamon, nutmegs, cassia, and other fruits and products in commerce. Few of the best of these, even *nobilis*, the Sweet Bay, will flourish in the north of this Island without protection. It and its allies, the Sassafras, Benzoin, etc., are propagated by cuttings under hand-lights, in the end of summer; by layers, by pieces of the roots, and by seeds, which generally require to be in the rot-heap a season before vegetating; common soil, if good, and dry, suits them. The stove and greenhouse species by cuttings in sand, under a bell-glass, and potted off in sandy peat and fibry loam, and the usual temperature of these compartments. Many, however, would do better planted against a conservatory wall, heated and protected in winter.

Lava'ndula. Lavender. (From *lavo*,

to wash; referring to lavender-water. Nat. ord., *Labiateæ*; Tribe, *Ocimoideæ*.)

Cuttings of large pieces, in spring and autumn, firmly inserted in the ground; but small, young, shoots in spring, under a hand-light, make the neatest plants; sandy loam suits them best. Those that require the protection of a pit or cool greenhouse are propagated in a similar manner, and require the same soil. The flowers of the common lavender (*L. spica*) are ready for drying or distilling at the end of June.

HARDY EVERGREENS.

- L. latifolia*. 2. Lilac. August. South Europe. 1568. A form of *L. spica*.

Lavatera. (Named after the two *Lavaters*, Swiss naturalists. Nat. ord., *Malvaceæ*; Tribe, *Malvææ*.)

Annuals and biennials, in common garden-soil, by seed in spring; herbaceous, by division, and cuttings at the same time; shrubby, by cuttings under a hand-light, in sandy soil; light, sandy loam suits them all. The frame and cool greenhouse species merely require the protection of these departments in winter.

HALF-HARDY EVERGREENS.

Lavender. *Lava'ndula*.

Lavender Cotton. *Santoli'na*.

Lavra'dia. (Named after the *Marquis of Lavradio*. Nat. ord., *Violaceæ*; Tribe, *Sauvagesieæ*.)

Sauvagesia, *Lavra'dia*, and *Luze'mburgia* compose this small tribe, which is intermediate between *Violaceæ* and *Frankeniaceæ*. Stove evergreen. Cuttings of ripened shoots in sand, under a bell-glass, and in heat; sandy peat and fibry loam, well drained. Summer temp., 60° to 80°; winter, 48° to 55°.

- L. glandulosa*. 1. Purple. Brazil. 1826. Syn., *L. montana*.

Lawn is a surface of turf in the vicinity of the house, requiring to be kept smooth by the regular application of the roller and scythe. When first constructed, after the ground has been dug over as level as may be, it must be rolled, the hollows filled up, and this repeated until a level surface of earth is obtained. It must then be slightly pointed over with a fork, and the turf laid, or the grass-seed sown. For directions to lay the turf, see **Turfing**. If seed is employed, the best is that of the common meadow grass, *Poa annua*.

In very dry weather all lawns should be watered, and, if a little guano and muriate of lime be dissolved in the water, it will keep the surface gently moist, and the turf green, even in dry weather.

Lawsonia. (Named after *Isaac Lawson, M.D.*, author of "A Voyage to Carolina." Nat. ord., *Lythraceæ*. Allied to *Grislea*.)

Stove trees, from the East Indies. Cuttings of ripe shoots in sand, under a bell-glass, and in strong heat; sandy peat and turfy loam. Summer temp., 60° to 85°; winter, 50° to 55°.

- L. alba*. White. 1752. Syns., *L. inermis* and *L. spinosa*.
— *purpurea*. 12. Purple. 1820.

Laxma'nnia. (Named after *E. Laxmann*, a Siberian traveller. Nat. ord., *Liliaceæ*; Tribe, *Johnsoniææ*. Allied to *Aphyllanthes*.)

Greenhouse herbaceous perennials, from Australia. Divisions; loam and peat; require a cold pit or cool greenhouse during winter.

L. graecilis. $\frac{1}{2}$. Purple, white. June. Queensland. 1824.
— *grandiflora*. White, brown. West Australia.

Layer. The following excellent combination of practice and science is from Dr. Lindley's "Theory of Horticulture:"—A layer is a branch bent into the earth, and half cut through at the bend, the free portion of the wound being called "a tongue." It is, in fact, a cutting only partially separated from its parent. The object of the gardener is to induce the layer to emit roots into the earth at the tongue. With this view he twists the shoot half round, so as to injure the wood-vessels; he heads it back, so that only a bud or two appears above ground, and when much nicety is requisite, he places a handful of silver-sand round the tongued part; then, pressing the earth down with his foot, so as to secure the layer, he leaves it without farther care. The intention of both tonguing and twisting is to prevent the return of sap from the layer into the main stem, while a small quantity is allowed to rise out of the latter into the former; the effect of this being to check the flow of the returning sap, and so assist in the production of adventitious roots at the bend, which is beneath the surface of the ground. The bending back is to assist in this object by preventing the expenditure of sap in the formation, or rather, completion of leaves, and the silver-sand is to secure the drainage so necessary to cuttings.

In most cases this is sufficient; but it must be obvious, that the exact manner in which the layering is effected is unimportant, and that it may be varied according to circumstances. Thus, Mr. James Munro describes a successful method of layering brittle-branched plants by simply slitting the shoot at the bend, and inserting a stone at that place; ("Gardener's Magazine," ix. 302;) and Mr. Knight found that, in cases of difficult rooting, the process is facilitated by ringing the shoot just below the tongue about Midsummer, when the leaves upon the layers had acquired their full growth; ("Hort. Trans." i. 256;) by which means he prevented the passage of the returning sap further downwards than the point intended for the emission of roots. It will sometimes happen that a branch of a plant cannot be conveniently bent

downwards into the earth; in such cases, the earth may be elevated to the branch by various contrivances, as is commonly done by the Chinese. When this is done, no other care is necessary than that required for layers, except to keep the earth surrounding the branch steadily moist. See figure.

Layia. (After *Thomas Lay*, naturalist during Captain Beechey's voyage, 1825-8. Nat. ord., *Compositæ*; Tribe, *Helianthoidæ*. Syns., *Callichroa*, *Calliglossa* and *Eriopappus*.)

Hardy annual herbs. Ordinary garden-soil. Seeds.

L. Calliglossa. 1 $\frac{1}{2}$. Yellow. N. America. Syn., *Oxyura chrysanthemoides*. B. R. t. 1850.
— *chrysanthemoides*. 1 $\frac{1}{2}$. Yellow. August. California. 1834.
— *elegans*. Yellow. May to August. 1838.
— *glandulosa*. White, yellow. N. W. America. B. M. t. 6856.
— *heterotricha*. White. California.
— *platyglossa*. 1. Yellow. October. California. 1835. Syn., *Callichroa platyglossa*. B. M. t. 3719.

Laying-in is a gardener's term for training the branches of espaliers and wall-trees. *Laying-in-by-the-heels* is his mode of describing a plant's having its roots roughly buried in the soil for some temporary purpose.

Lazy-beds are beds dug for the growth of potatoes, the sets being then placed in rows on the surface, and covered by the soil dug out of narrow, deep alleys between the beds.

Leadwort. *Plumbago*.

Leaf-mould. This is formed of leaves kept moist and in a heap, frequently turned over, until completely decayed, and reduced to a dark brown, moist powder. It usually takes two years to complete this process. An excess of water delays the decaying, and either lime or gas ammoniacal liquor promotes it; but then few potted plants are benefited by any such excess of either of these additions.

Leatherwood. *D'urca*.

Leavenworthia. (Named after *M. C. Leavenworth*. Nat. ord., *Cruciferae*; Tribe, *Arabideæ*. Allied to *Cardamine*.)

Hardy annual. Seeds in the open border in autumn. Common garden-soil.

L. aurea. $\frac{1}{2}$. Rosy, with yellow eye. June. S. United States. 1868.

Leaves are the organs, in which some of the most important functions of a plant are performed. They are very general, but not absolutely necessary organs, since branches sometimes perform their offices, as in many Cacti.

Such plants, however, as naturally possess them, are destroyed, or greatly injured, by being deprived of them. Leaves are divided into two classes, viz;—1. *Simple*, which may be either entire, or more or less divided, but with the segments not articulated with the main axis. 2. *Compound*, in which the leaflets are articulated. The simplest form of compound leaf, consisting of a single leaflet, is to be found in the Orange.

The duration of a leaf is, in general, for a year only, though in some plants they survive for twice or thrice that period. These organs are generally of a green colour. Light seems to have a powerful influence in causing this, since, if kept in the dark, they become of a pale yellow, or even white hue, unless uncombined hydrogen is present, in which case they retain their verdure though light be absent. Hence their blanching would seem to arise from their being unable to obtain this gas under ordinary circumstances, except when light is present. Now, the only source from which they can obtain hydrogen is by decomposing water; and how light assists in the decomposition, may perhaps, be explained by the dis-oxygenizing power with which it is gifted. The violet rays of the spectrum, and those just beyond them, have this power in the greatest degree; and Sennebler has ascertained by experiment, that those rays have the greatest influence in producing the green colour of plants.

When leaves are of any other hue than green they are said to be *coloured*. This variegation is often considered to be a symptom either of tenderness or debility; and it is certain, when the leaves of a plant become generally white, that that individual is seldom long-lived. Mr. Knight, however, has demonstrated that variegation is not a certain indication of a deficiency of hardihood.

The functions of the leaves appear to be a combination of those of the lungs and stomach of animals; they not only modify the food brought to them from the roots, so as to fit it for increasing the size of the parent plant, but they also absorb nourishment from the atmosphere. This, after elaboration in these organs, differs in every plant, though, as far as experiments have been tried, it appears to be nearly the same in all vegetables when it first reaches them. The power of a leaf to generate sap is in proportion to its area of surface, exposure to the light, and congenial situation.

The transpiration of plants decreases with that of the temperature to which

they are exposed, as well as with the period of their growth. This explains why the gardener finds that his plants do not require so much water in cold weather, nor during the time that elapses between the fall of their blossoms and the ripening of their seed. During this period they do not transpire more than one-half so much as during the period preceding and attending upon their blooming.

The transpiration takes place from the upper surface of the leaves. Hence arises the benefit which plants derive in rooms, greenhouses, and other confined inclosures, by keeping these surfaces cleansed with the sponge and syringe. Some plants are particularly sensitive to injury from any check to their transpiration, among which are the tea-scented roses; and it thence arises that they cannot now be cultivated in nursery gardens near London, where they once flourished when that metropolis was less extensive. It must be remembered, however, in using the sponge and syringe, that the under side of leaves is also an absorbing surface, benefited by being kept clean, and by the application of moisture.

During the day leaves absorb carbonic acid gas, which they decompose, retaining its carbon, and emitting the greater part of the oxygen that enters into its composition. In the night this operation is, in a certain measure, reversed, a small quantity of oxygen being absorbed from the atmosphere, and a yet smaller proportion of carbonic acid emitted.

Carbonic acid gas in small proportions is essential to the existence of leaves; yet it only benefits them when present in quantities not exceeding one-twelfth of the bulk of the atmosphere in which they are vegetating, though one-twenty-fifth is a still more favourable proportion; and as hotheds, heated by fermenting matters, have the air within their frames rapidly contaminated to a much greater extent than the proportions above named, thence arises the injury to the plants they contain from a too long neglected ventilation. The leaves turn yellow from the excess of acid, which they are unable to digest, and which consequently effects that change of colour which also occurs in autumn.

Lebe'ckia. (Probably derived from the native name. Nat. ord., *Leguminosæ*; Tribe, *Genistææ*.)

Greenhouse shrubs. For culture, see ASPALATHUS.

L. cytisioides. 2-4. Yellow. May. South Africa. Syn., *Crotalaria pulchella*. B. M. t. 1699.

- L. m'ida*. B. M. t. 2214. A synonym of *Indigofera filifolia*.
 — *sericea*. Yellow. South Africa. Syn., *Crotalaria angustifolia*. Jacq. H. Schoenb. t. 219.
 — *Simsiana*. Yellow. March. South Africa. 1820. Syn., *Sarcophyllum carnosum*. B. M. t. 2502.

Lebretonia. See **Pavonia**.

Lecanopteris. (From *lekane*, a basin, and *pterus*, a fern. Nat. ord., *Filices*—*Polypodiaceae*.) Now referred to **Polypodium**.

A fine stove fern. See **FERNs**.

L. carnosae. Yellow. May. Java.

Lechenaultia. See **Leschenaultia**.

Lecythea mixta. A fungus, allied to *Uredo*, producing pustules on the lower side of the leaves of Willows (*Salix*). When ripe these pustules burst and emit numerous rusty orange coloured spores.

Ledebouria. (Named after *M. Ledebour*, a botanical writer. Nat. ord., *Liliaceae*; Tribe, *Scilleae*.) See **Scilla**.
L. hyacinthina. B. M. t. 3226. See *Scilla indica*.

Ledenbergia. (Commemorative. Nat. ord., *Phytolaccaceae*; Tribe, *Rivineae*.)

Stove climbing shrub. Cuttings in sandy loam, in bottom-heat and under a hand-glass. Rich loam and leaf-mould; good drainage and plenty of pot-room. Summer temp., 60° to 85°; winter, 60° to 70°.

L. roseo-ænea. Leaves coppery-green above, violet beneath. Upper Amazons. 1869. Ill. Hort. t. 591. Syn., *Phytolacca purpurascens*.

Ledocarpum. (From *ledon*, the *Cistus*, and *karpos*, a fruit; fruit like that of the *Cistus*. Nat. ord., *Geraniaceae*; Tribe, *Oxalideae*.) Now referred to **Balbisia**.

L. pedunculataris. B. R. t. 1392. A synonym of *Balbisia pedunculataris*.

— *verticillatum*. B. R. t. 6170. See *Balbisia verticillata*.

Ledon Gum. *Cistus le'don*.

Le'dum. Labrador Tea. (From *ledon*, the Greek name of *Cistus*. Nat. ord., *Ericaceae*; Tribe, *Rhodoreae*. Allied to the *Rhododendron*.)

Hardy, evergreen, white-flowered shrubs. Layers; peat, with a little sand. Very pretty for bordering *Rhododendrons*.

L. buxifolium. See *Leptophyllum buxifolium*.
 — *canadense*. See *L. latifolium*, var. *canadense*.
 — *glandulosum*. 2-6. N. Amer.
 — *latifolium*. 3. April. N. Amer. 1763. Syn.,
L. groenlandicum.

L. patu'stre decumbens. ½. April. Hudson's Bay. 1762.

Lee'a. (In memory of *James Lee*, a Hammersmith nurseryman, 1715-1795. Nat. ord., *Ampelideae*.)

Stove shrubs, requiring a rich loam and moist atmosphere.

L. ama'bilis. Leaves bronzy-green, with a white central stripe above; claret-red beneath. Borneo. 1880. G. C. 1882, xvii. p. 493, fig. 77.

— *coccinea*. Flowers scarlet outside, pink inside. Java? 1862. B. M. t. 5299. Syn.,
Aralia excelsa.

Lee-chee. *Nephe'lium Li'tchi*.

Leek. (*Allium porrum*.) The leek is a hardy biennial; for although it attains perfection in size and for culinary purposes the first year, it does not run to seed until the second, the perfecting of which it often survives. The whole plant is eaten, being employed in soups, etc., and boiled and eaten with meat.

Varieties.—The *Musselburgh* and the large *London Leek*, which are by far the best; the *Scotch*, or *Flag*, which is larger and harder; and the *Flanders*.

Sowing.—Sow first in the end of February a small crop for transplanting in June and July, as well as in part to remain where sown; again, for the main crop, in the course of March or early in April; and lastly, towards the close of April or beginning of May, for late transplanting. Sow in drills, some to remain after thinning; the leek, however, is much benefited by transplanting.

Cultivation.—When the plants are three or four inches in height, hoe and thin to two or three inches apart; water, also, in dry weather, will strengthen and forward them for transplanting, when six or eight inches high. They must be taken away regularly from the seed-bed, the ground being well watered previously, if not soft and easily yielding. When thinned out they may be left to remain in the seed-bed six inches asunder, as they do not grow so large as the transplanted ones, which must be set by the dibble in rows ten inches apart each way, nearly down to the leaves, that the neck, by being covered with the earth, may be blanched; water in abundance at the time of planting, and shorten the long, weak leaves, but leave the roots as uninjured as possible. By this treatment, and by cutting off the tops of the leaves about once a month, as new ones are produced, the neck swells to a much larger size. The several sowings above directed will yield a supply from August until the following May, when they advance to seed. A portion should be always taken up and

laid in sand previous to the ground being locked up by continued frost; but they will not keep many days in this situation.

Legume. The seed-pod of the order *Leguminosæ*, e.g., Pea pod.

Leia'nthus. (From *leios*, smooth, and *anthos*, a flower. Nat. ord., *Gentianaceæ*; Tribe, *Chironiææ*. Allied to *Lisianthus*.)

Stove plants. Seeds, sown carefully in a pot, placed in a hotbed; cuttings of young shoots in sandy soil, under a glass, in heat; sandy peat and fibry loam; a good heat when growing, cool and airy when blooming. General temperature, from 55° to 80°.

L. longifolius. 2. Yellow. August. Jamaica. 1844. Evergreen shrub. Syn., *Lisianthus longifolius*. B. R. t. 880.

— *nigrescens*. 1½. Blackish. August. Guatemala. 1842. Biennial. Syn., *Petalostylis nigrescens*.

— *umbellatus*. 20. Green, yellow. May. Jamaica. 1843. Evergreen tree.

Leiochilus. (From *leios*, smooth, and *cheilos*, a lip. Nat. ord., *Orchidææ*; Tribe, *Vandææ-Oncidiææ*. By some writers erroneously spelt *Leochilus*. Allied to *Oncidium*.)

Stove orchids. Division in spring; fibry peat, sphagnum, and crocks, and cultivated in shallow baskets, suspended from the roof of a moist orchid-house. Winter temp., 55° to 60°; summer, 60° to 90°.

L. carinatus. Orange. Xalapa. 1842.

— *cochlearis*. Yellow. Dominica. 1842.

— *oncidioides*. ½. Green, purple. March. Mexico. 1840. Syns., *Oncidium macrantherum*, B. M. t. 3845, and *Rodriguezia maculata*.

— *sanguinolentus*. Crimson. La Guayra. 1842.

Leiophyllum. (From *leios*, smooth, and *phyllon*, a leaf. Nat. ord., *Ericaceææ*. Allied to *Ledum*. Syn., *Ammyrsine*.)

Hardy evergreen shrubs. Cuttings and layers; peaty soil.

L. buxifolium. 1. White. May. New Jersey. 1736. B. M. t. 6752. Syns., *L. thymifolia*, *Ammyrsine buxifolia*, B. R. t. 531, and *Ledum buxifolium*.

— *Lycnii*. White. April. Carolina. 1812.

Lemon. See **Citrus**.

Lemon-grass. *Andropogon schœnanthus*.

Lemo'nia. (Named after Sir C. Lemon, M.P. Nat. ord., *Rutaceææ*; Tribe, *Cuspariææ*.) See **Ravenia**.

L. spectabilis. B. R. 840, t. 59. See *Ravenia spectabilis*.

Lenne'a. (Named after M. Lenné, a foreign landscape-gardener. Nat. ord., *Leguminosææ*; Tribe, *Galegæææ*. Allied to *Wistaria*.)

Greenhouse deciduous shrub. Young shoots in spring, or ripened shoots towards autumn, under a hand-light. Must have similar protection and treatment to the *Genista canariensis*

L. robinoides. Crimson. April. Mexico. 1843. Paxt. Fl. Gard. iii. p. 27, fig. 246.

Lenticula palustris. A synonym of *Pistia stratiotes*.

Leo'chilus. See **Leiochilus**.

Leo'nis. Lion's Ear. (From *leon*, a lion, and *ous*, an ear; some resemblance in the flower. Nat. ord., *Labiataææ*; Tribe, *Stachydeæææ*. Allied to *Phlomis*.)

Annuals, by seed in hotbed, and young plants, then treated as tender annuals; shrubs, by cuttings in sand, under a bell-glass, in peat; sandy peat and fibry loam. Common greenhouse and plant-stove treatment. Herbaceous species, by seeds, and division of the plant.

L. intermedia. 3. Orange. September. Cape of Good Hope. 1822. B. R. t. 850.

— *la-cerus*. See *Leonurus cardiacus*, var. *villosus*.

— *Leonurus*. 3. Scarlet. November. Cape of Good Hope. 1812. G. C. 1883, xix. p. 186, fig. 28. Syn., *Phlomis Leonurus*.

— *nepetifolia*. 3. Orange. September. E. Ind. 1778. B. R. t. 281.

— *ovata*. 1½. Orange. June. Cape of Good Hope. 1813.

Leo'ntice. (From *leon*, a lion; from a supposed resemblance of the leaf to the point of a lion's foot. Nat. ord., *Berberidæææ*.)

For culture, see CAULOPHYLLUM.

L. Albe'rti. Brownish-yellow. Turkestan.

— *altaica*. ½. Yellow. April. Altai Mts., Siberia. B. M. t. 3245.

— *chryso'gonum*. Maund Bot. t. 50. See *Bongardia Ranzolfii*.

— *thalictroides*. B. C. t. 1473. See *Caulophyllum thalictroides*.

Leo'ntodon. (From *leon*, a lion, and *odus*, a tooth; in reference to the edge of the leaves. Nat. ord., *Compositæææ*. Syn., *Apargia*.)

The following hardy herbaceous perennial is the only one worth cultivating, though there are many other species.

L. croceum aurantiacum. 1. Orange. June. Hungary. 1816. Syn., *Apargia aurantiaca*.

Leontopo'dium. Lion's Foot. (From *leon*, a lion, and *pous*, a foot; resemblance of the flower-heads. Nat. ord., *Compositæææ*; Tribe, *Inuloideæææ*. Allied to *Antennaria*.)

Hardy herbaceous perennial. Seeds, and division of the roots in spring; common soil.

L. alpinum. Yellow. June. Alps of Europe. 1776. G. C. 1881, xvi. p. 529. Syns., *L. helveticum*, *L. sibiricum*, *L. vulgare*, and *Gnaphalium Leontopodium*. B. R. t. 1958.

— The Edelweiss.

Leonu'rus. (From *leon*, a lion, and *oura*, a tail. Nat. ord., *Labiataæææ*; Tribe, *Stachydeææææ*.)

Annual herbs. For culture, see LEONOTIS.

L. cardiaca. 3. Red. June. Britain.

— *crispus*. 2. Red. July. Siberia. 1658.

— *villosus*. 3. Purple. July. Tauria. 1820. Syn., *Leonotis tacerus*.

L. lana'tus. 2. Yellow. July. Siberia. 1752.
— *sibi'ricus*. 2. Red. July. Siberia. 1759.

Leopard Moth. This moth occasionally infests the interior of the stems of Apple, Pear and Plum trees, feeding on their wood, but its attack appears to do but little damage. The ground colour of the moth is white, which is thickly covered with bluish-black spots, whence its name.

Leopard's Bane. *Doro'nicum*.

Leopoldi'nia. (Named after the late Empress of Brazil. Nat. ord., *Palmeæ*; Tribe, *Areceæ*.)

L. pu'ichra. See *Cocos Weddelliana*.

Lepa'chys. (From *lepis*, a scale, and *achyron*, chaff; referring to the scales of the involucre. Nat. ord., *Compositæ*.)

Hardy herbaceous plant.

L. prima'ta. 4. Yellow. September. North America.

Lepa'nthes. (From *lepis*, a scale, and *anthos*, a flower; scales flower-shaped inclosing the stem. Nat. ord., *Orchideæ*; Tribe, *Epidendrea-Pleurothalleæ*.)

Stove orchids. See ORCHIDS.

L. calodi'ctyon. †. Leaves pale green, with rich brown veins; flowers inconspicuous. Andes. B. M. t. 5259.

— *sangui'nea*. Red-rose. Jamaica. 1844. B. M. t. 4112.

— *tridenta'ta*. Purple, yellow. Jamaica. 1835. B. R. t. 1762.

Lepechi'nia. (Named after *Lepechin*, a Russian botanist. Nat. ord., *Labiata*; Tribe, *Satureineæ*. Allied to *Sphacele*.)

Hardy herbaceous perennials. Division of the plant in spring, and cuttings of young shoots in sandy soil, under a hand-light, in spring and summer; loam and a little peat. *Spica'ta* requires a little protection in winter.

L. clinopodi'folia. See *Mentha dahurica*.

— *spica'ta*. 1. Pale yellow. July. Mexico. 1800. B. R. t. 1292.

Leperi'za. (From *lepis*, a scale, and *rhiza*, a root; in reference to the imbricating scales of the bulb. Nat. ord., *Amaryllidæ*; Tribe, *Pancreaticeæ*.) See **Stricklandia**.

L. eucrosioi'des. See *Stricklandia eucrosioides*.
— *latifo'lia*. B. M. t. 4952. See *Urceolina latifolia*.

Lepicy'stis. (From *lepis*, a scale, and *kyste*, a box; alluding to the sori being placed among scales. Nat. ord., *Filices—Polypodiaceæ*.)

L. inca'na. 1. Tropical America. 1841.

— *sepu'ita*. 1. Tropical America. 1841.

— *squama'ta*. 10. W. Indies.

Lepida'gathis. (From *lepis*, a scale, and *agathis*, a ball; referring to the

bracts. Nat. ord., *Acanthaceæ*; Tribe, *Justicieæ*. Allied to *Geissomeria*.)

Stove evergreen. Cuttings of young shoots, getting a little firm, in May, in sandy soil, in bottom-heat; fibry, sandy loam, and a little peat and leaf-mould. Summer temp. 60° to 80°; winter, 45° to 58°.

L. crista'ta. 2. India. 1820.

Lepi'dium. (A name used by Dioscorides: Nat. ord., *Cruciferae*.)

L. sati'vum is the Garden Cress, a hardy annual, propagated by seeds.

L. sati'vum. 1-1½. White. JUNE. Persia? 1548.

Lepido'ptera. (From *lepis*, a scale, and *pteron*, a wing.) An order of insects comprising the Butterflies and Moths, the characteristics of which are:—body hairy, or scaly; mouth with a proboscis; wings covered with scales. The larvæ are known as caterpillars. Butterflies have the antennæ with a club-shaped tip, moths with a pointed or plumose one.

Lepidoste'mon *pentstemonoi'des*. See **Pentstemon Lobbianus**.

Lepidoza'mia. See **Macrozamia**.

Lepi'smium. (From *lepis*, a scale; referring to the small scales at the crenatures. Nat. ord., *Cactaceæ*; Tribe, *Opuntieæ*.) United by some with **Rhipsalis**.

Greenhouse fleshy-leaved plants. For culture, see **CEREUS**.

L. caverno'sum. Stems flat. S. Brazil and Paraguay. Gf. 1890, p. 151, fig. 38.

— *commu'ne*. Rose, white. September. 1836. B. M. t. 3763.

— *dissi'mile*. S. Brazil. Gf. 1890, p. 148, figs. 36-37.

— *myosu'rus*. 4. Yellow, white. July. Brazil. 1837. B. M. t. 3755. Syn., *Rhipsalis paradoxa*.

— *parado'xum*. 3. 1846.

Lepta'ndra. See **Veronica**.

Lepta'nthus. (From *leptos*, slender, and *anthos*, a flower. Nat. ord., *Pontederaceæ*.) A synonym of **Heteranthera**.

L. grami'neus. 1. Yellow. July. N. Amer. 1823. A synonym of *Heteranthera graminea*.

— *lim'o'sa*. See *Heteranthera limosa*. B. M. t. 6192.

— *renifo'rmis*. See *Heteranthera reniformis*.

Leptarrhe'na. (From *leptos*, slender, and *arren*, male. Nat. ord., *Saxifragaceæ*; Tribe, *Saxifragææ*.)

Hardy herbaceous perennial. For culture, see **SAXIFRAGA**.

L. pyroli'folia. †. May. N. America. 1827. Syn., *Saxifraga pyroliifolia*.

Leptine'lla. (From *leptos*, slender; the habit of these plants. Nat. ord., *Compositæ*; Tribe, *Anthemideæ*.)

Small hardy, perennial herbs, from the Southern Hemisphere.

- L. dioica*. † Yellow. Summer. New Zealand.
— *lanata*. Yellow. Lord Auckland's Islands.
— *plumosa*. Yellow. Lord Auckland's Islands.

Leptocallis. See *Ipomæa*.

Leptoceras. (From *leptos*, slender, and *keras*, a horn; referring to the form and substance of the column. Nat. ord., *Orchidææ*; Tribe, *Neottieæ*.) United to **Caladenia** under the specific names annexed.

Greenhouse terrestrial orchids, from Swan River. Division in spring; fibry peat, well drained, with a little leaf-mould and sand. Winter temp., 45° to 50°.

- L. ambriata*. Yellow. May. CALADENIA FIMBRIATA.
— *oblonga*. Yellow. May. CALADENIA MENZESII.
— *pectinata*. Yellow. May. CALADENIA FIMBRIATA.

Leptochilus. (From *leptos*, slender, and *cheilos*, a lip; alluding to the form of the indusium. Nat. ord., *Filices—Polypodiaceæ*.)

Stove fern. See FERNES.

- L. axillaris*. See *Gymnopteris nicotianifolia*.
— *decurrens*. Indian Islands.

Leptodactylon. (From *leptos*, slender, and *dactylos*, a finger; referring to the form of the leaves. Nat. ord., *Polemoniaceæ*.) See *Gilia*.

- L. californicum*. B. M. t. 4872. See *Gilia californica*.

Leptodermis. (From *leptos*, slender, and *derma*, the skin; referring to the thin bark. Nat. ord., *Rubiaceæ*; Tribe, *Pæderieæ*. Allied to *Hamiltonia*.)

Greenhouse evergreen shrub. Cuttings of half-ripened young shoots in April, in sand, under a bell-glass, and in a mild bottom-heat; sandy peat and fibry loam. Winter temp., 45° to 48°.

- L. lanceolata*. 3. Yellow. June. Nepal. 1842.

Leptogramma. (From *leptos*, slender, and *gramma*, writing; referring to the form of the spore or seed-cases. Nat. ord., *Filices*.) Now referred to **Gymnogramme**.

Stove ferns, with brownish-yellow spores. See FERNES.

- L. asplenoides*. June. Jamaica.
— *gracilis*. June. Brazil.
— *linkiana*. Brazil.
— *polypodioides*. June. Brazil.
— *rupesstris*. Tropical America.
— *totia*. S. Africa.
— *villosa*. 2. July. Brazil. 1836.

Leptomeiria. (From *leptos*, slender, and *meris*, a part; referring to the slender and almost leafless shoots. Nat. ord., *Santalaceæ*; Tribe, *Osyrideæ*.)

Greenhouse evergreens, with white blossoms, from Australia. Cuttings of firm young shoots in sand, under a bell-glass; sandy peat and fibry

loam, with pieces of charcoal. Winter temp., 40° to 48°.

- L. aida*. 6-8. Queensland. 1823.
— *Billardieri*. 1-7. New South Wales. 1823.

Leptopteris superba. See *Todea*.

Leptosiphon. (From *leptos*, slender, and *siphon*, a tube; alluding to the tube of the flower. Nat. ord., *Polemoniaceæ*.) See *Gilia*.

- L. androsaceus*. See *Gilia androsacea*.
— *cihiatus*. See *Gilia ciliata*.
— *densiflorus*. See *Gilia densiflora*.
— *corolla alba*. See *Gilia densiflora*, var. *alba*.
— *grandiflorus*. See *Gilia grandiflora*.
— *luteus*. See *Gilia lutea*.
— *paullidus*. See *Gilia lutea*, var. *pallida*.
— *parviflorus*. See *Gilia micrantha*.
— *roseus*. See *Gilia micrantha*.

Leptospermum. (From *leptos*, slender, and *sperma*, a seed. Nat. ord., *Myrtaceæ*; Tribe, *Leptospermeæ*. Allied to *Metrosideros*.)

Australian, greenhouse, evergreen plants, with white flowers. Seeds in a hotbed, in March; cuttings of young shoots, getting firm, in May, in well-drained pots, in sand, under a glass; loam two parts, peat one part, sand and charcoal half a part. Winter temp., 38° to 48°. Some, such as *lanigerum* and *grandiflorum*, would do well on conservatory walls.

- L. ambiguum*. B. C. t. 1998. A synonym of *Kunzea corifolia*.

- *annua*. White, pink. Mindanao. Gfl. t. 1184.
— *arachnoides*. 3. June. 1795.
— *attenuatum*. 5. June. 1795.
— *baccatum*. 3. June. 1790.
— *emarginatum*. 5. June. 1818.
— *flavescens*. 5. June. 1787.
— *flezuosum*. A synonym of *Agonis flezuosa*.
— *grandiflorum*. 5. June. 1810. B. C. t. 514.
— *juniperinum*. 2. June. 1790.
— *lanigerum*. 5. June. 1774.
— *multicaule*. 4. June. 1824.
— *myrtifolium*. 8-10. June. 1824.
— *obitum*. June. 1800.
— *pedunculatum*. 4. July.
— *seoparium*. White. New Zealand. 1876.
The leaves are used as tea. B. M. t. 3419.

- *sericeum*. 5. June. N. S. Wales. 1818.
— *squarrosum*. 4. July.
— *thymifolium*. 5. June. 1824.
— *triloculare*. 2. June. 1800. B. C. t. 791.

Leptostelma maxima. See *Eriogon maximum*.

Leptosyne. See *Coreopsis*.

Leptosites. (From *leptos*, slender; referring to the leaves. Nat. ord., *Orchidææ*; Tribe, *Epidendree-Lælicæ*. Allied to *Brassavola*.) See *Tetramicra*.

- L. bicolor*. B. R. t. 1625. B. M. t. 3734. See *Tetramicra bicolor*.

Leschenaultia. (Named after M. Leschenault, a French botanist. Nat. ord., *Goodeniaceæ*.)

Greenhouse evergreens, from Australia. Cuttings of the points of young shoots in sand, under a bell-glass, and as soon as struck, potted and grown in an open compost of turfy peat, fibry

loam, silver sand, and pieces of broken pots and charcoal, the pots being well drained. Winter temp., 38° to 45°, with plenty of air when possible. A shady position in summer.

- L. arcuata*. B. M. t. 4265. See *L. linarioides*.
 — *Baxteri*. See *L. formosa*.
 — *ma'jor*. Australia. Rev. Hort., 1886, p. 468.
 — *bicolor ma'jor*. Blus. Australia. Garden, Oct. 4, 1884.
 — *bilo'ba*. 1. Blue. June. 1840.
 — *formosa*. 1. Scarlet. Juns. 1824. B. M. t. 2800. Syns., *L. Baxteri*, *L. multiflora*, B. C. t. 1579, and *L. oblata*.
 — *lari'cina*. 1½. Scarlet. June. 1844. Syn., *L. splendens*, B. M. t. 4255.
 — *multiflora*. } See *L. formosa*.
 — *oblata*. }
 — *splendens*. See *L. larcicina*.

Lespedeza. (Named after *Lespedez*, once governor of Florida. Nat. ord., *Leguminosæ*; Tribe, *Hedysarææ*. Allied to *Halim.*)

North American plants, except where otherwise specified. Annuals, by seed, in a sandy, peaty border; perennials, by the same means in spring, and division of the roots; shrubs, cuttings either of young or ripened wood in sand, under a bell-glass; sandy, fibry peat. *Eriocarpia* requires the greenhouse, and *glomerata* must be grown as a tender annual.

- L. angustifolia*. 2. Pale purple. June. 1800. Perennial.
 — *bicolor*. 3. Rose-purple. October. N. China and Japan. 1858. B. M. t. 6602.
 — *capillipes*. 3. Purple. China.
 — *Dela'vayi*. 3-6. Violet to black-purple. Yunnan. Rev. Hort. 1890, p. 225, fig. 70.
 — *divergens*. 2. Violet. July. 1800. Syn., *L. violacea*, var. *divergens*.
 — *eriocarpa*. 1. Violet. July. Nepaul. 1819. Greenhouse evergreen.
 — *frutescens*. 4. Purple. July. 1793. Deciduous shrub.
 — *glomerata*. 3. Purple. July. E. Indies. 1819. Stove annual.
 — *hirtella*. 3. Violet. August. China.
 — *macrocarpa*. 3. Rosy-violet. N. China. 1833.
 — *polyantha*. Purple. China.
 — *polystachya*. 3. White. July. 1789. Perennial.
 — *prostrata*. ½. Purple. July. 1810. Trailer.
 — *reticulata*. 2. Purple. 1816. Syn., *L. violacea*, var. *reticulata*.
 — *sessiliflora*. 3. Purple. 1800. Syn., *L. violacea*, var. *sessiliflora*.
 — *Sieboldii*. Japan. Syn., *Desmodium penduliflorum*.
 — *Stru'vei*. 1½. Purple. July. 1824. Hardy annual.
 — *trigono'clada*. Pale yellow or whitish. Heeh-an-men, China. 1890.
 — *villo'sa*. White. July. 1819. Perennial.
 — *violacea*. 2. Violet. July. 1799. Perennial.
 — *divergens*. See *L. divergens*.
 — *reticulata*. See *L. reticulata*.
 — *sessiliflora*. See *L. sessiliflora*.
 — *yunnanensis*. Pale violet. China.

Lesser'tia. (Named after the French botanist, *Baron Delessert*. Nat. ord., *Leguminosæ*; Tribe, *Galegeææ*. Allied to *Swainsonia*.)

All natives of South Africa. Shrubby kinds, by seed in spring, and cuttings of young shoots in sand, under a glass; loam and peat; annuals, by seeds; and perennials, by seeds and division

in spring; the seedlings should be potted off, when a few inches in height, into light, sandy loam. Winter temp., 40° to 48°.

GREENHOUSE ANNUALS.

- L. argentea*. ½. Purple. June. 1822. Syn., *L. tomentosa*.
 — *diffusa*. ½. Rosy-purple. Syn., *Galega dubia*. Jacq. Ic. t. 576.
 — *vesicaria*. Purple. June. 1825.
 — *virgata*. Purple. June. 1823.

GREENHOUSE HERBACEOUS PERENNIALS.

 — *pubescentis*. 1½. Red. May. 1817. B. M. t. 2064.

Lettsomia. (Named after *J. C. Lettsom*, a British physician and naturalist. Nat. ord., *Ternstroemiaceæ*; Tribe, *Ternstroemiææ*. Allied to *Freziera*.)

Stove evergreen shrub. Cuttings of young shoots, getting firm, in April or May, in sand, under a bell-glass, and a sweet bottom-heat; sandy, fibry loam, and sandy, turfy peat. Summer temp., 60° to 85°; winter, 55° to 60°.

- L. tomentosa*. 4. White. Peru. 1823.

Lettuce. *Lactuca*.

Lettuce Fungus. *Peronospora ganglioniflora*.

Leucadendron. (From *leukos*, white, and *dendron*, a tree; the white-leaved Silver-trees of the Cape colonists. Nat. ord., *Proteaceæ*; Tribe, *Proteææ*.)

Greenhouse evergreen shrubs, with yellow flowers, from South Africa. Cuttings of the ripened shoots in summer, in sand, under a glass, and kept cool until the base of the cutting has callused, when extra heat may be applied; fibry loam and sandy peat, with a few rough pieces of charcoal, to keep the compost open. Winter temp., 38° to 45°.

- L. abietinum*. Yellow. Syn., *Protea teretifolia*. Andr. Rep. t. 461.

Leuca'na (from *leukos*, shining. Nat. ord., *Leguminosæ*; Tribe, *Mimosæ*), is a genus formed of *Acacia glauca* and *A. trichodes*.

Leu'cas. (From *leukos*, white; the colour of the flowers. Nat. ord., *Labiatae*; Tribe, *Stachydeæ*.)

For culture, see PHLOMIS.

- L. tinifolia*. 1. White. Tropics of E. Hemisphere. Syn., *Phlomis zeylanica*. Jacq. Ic. t. 111.
 — *martineznsis*. White. Throughout the Tropics. Syn., *Phlomis caribæa*. Jacq. Ic. t. 110.

Leuce'ria. (From *leukeres*, white; the leaves of some of the species have a white felt beneath. Nat. ord., *Compositæ*; Tribe, *Mutisiaceæ*.)

Greenhouse herb.

- L. runcinata*. 1½. White. June. Chili. 1844. Syns., *Chabrea runcinata*. B. M. t. 4116, *Lasiorrhiza rosea* and *L. runcinata*.

Leuchtenbe'rgia. (Named after Prince Leuchtenburg. Nat. ord., *Cactaceæ*; Tribe, *Echinocactæ*.)

Greenhouse evergreen. For culture, see CACTUS—*Echinocactus*.

- L. principis*. 1. Yellow. June. Mexico. 1847. B. M. t. 4393.

Leucocarpus. (From *leukos*, white, and *carpos*, a fruit. Nat. ord., *Scrophulariaceæ*; Tribe, *Cheloneæ*.)

Half-hardy perennial. Seed in autumn; division and cuttings in spring; requires a little protection in winter; loam, leaf-mould, peat, and a little sand.

- L. alatus*. 2. Yellow. Vera Cruz. 1830. Swt. Fl. Gard. ser. 2, t. 124. Syn., *Mimulus perforiatus*. B. M. t. 3067.

Leucocoryne. (From *leukos*, white, and *koryne*, a club; referring to the sterile anthers. Nat. ord., *Liliaceæ*; Tribe, *Alliæ*. Allied to *Brodiaea*.)

Beautiful little half-hardy bulbs, from Chili, requiring the same treatment as *Ixias*.

- L. alliciaea*. 1. White. 1825. Paxt. Mag. xi. p. 101.
 — *ixioides*. Lilac. October. 1821. Ref. Bot. t. 348. Syn., *Brodiaea ixioides*. B. M. t. 2382.
 — — *odora* ta. 1. White. August. 1826. B. R. t. 1293.

Leuco'jum. Snowflake. (From *leukos*, white, and *ion*, a violet; referring to the colour and fragrance of the flowers. Nat. ord., *Amaryllidææ*; Tribe, *Amaryllidææ*. Allied to *Galanthus*. Syns., *Acis* and *Erinosma*.)

- Hardy bulbs. Offsets in spring; sandy loam.
L. aestivum. ½. White. May. Central and South Europe. B. M. t. 1210.
 — *autumnale*. ½. Pink, white. August. Portugal and Morocco. B. M. t. 960. Syn., *Acis autumnalis*.
 — *Hernandezii*. See *L. pulchellum*.
 — *hyemale*. ½. White, green. April. South France. B. M. t. 6711.
 — *longifolium*. ½-1. White. April. Mountains of Corsica.
 — *pulchellum*. ½. White. April. Sardinia. Syn., *L. Hernandezii*.
 — *roseum*. Rose-red. September. Mountains of Corsica. 1820. Syn., *Acis rosea*. Swt. Fl. Gard. t. 297.
 — — *longifolium*. A synonym of *L. longifolium*.
 — *strumosum*. See *Hesaea filifolia*.

Leucophyllum. (From *leukos*, white, and *phyllon*, leaf; the leaves are silvery. Nat. ord., *Scrophulariaceæ*.)

Greenhouse shrub.

- L. texanum*. Violet-purple. Mexico. 1839. G. and F. iii. p. 483, fig. 63.

Leuco'pogon. (From *leukos*, white, and *pogon*, a beard; referring to the hairs on the flowers. Nat. ord., *Epicridaceæ*; Tribe, *Stypheliææ*. Allied to *Lissanthe*.)

This is "the native currant" of settlers in Australia. Greenhouse, Australian, white-flowering, evergreen shrubs. Cuttings of the points of shoots, getting a little firm in May, in sand, under a bell-glass; peat and loam, both fibry, with silver sand, and nodules of charcoal to keep the compost open; drainage and watering must be carefully attended to. Winter temp., 38° to 45°.

Leucorha'phis. (From *leukos*, white, and *rhaphis*, a needle. Nat.

ord., *Acanthaceae*.) A synonym of **Brilliantaisia**.

L. La'mium. See *Brillantaisia Owariensis*.
— *Vogelia'na*. See *Brillantaisia Vogelianana*.

Leucosce'ptrum. (From *leukos*, white, and *skeptron*, staff. Nat. ord., *Labiatae*.) See **Teucrium**.

L. ca'num. See *Teucrium macrostachyum*.

Leucospe'rmum. (From *leukos*, white, and *sperma*, a seed. Nat. ord., *Proteaceae*; Tribe, *Protea*. Allied to *Protea*.)

Greenhouse evergreen shrubs, with yellow flowers, from South Africa. Cuttings of ripe young shoots, with the leaves left on, except those close to the base of the cutting, firmly in sand, and covered with a bell-glass, kept cool, and care taken to prevent damping; light, sandy, fibry loam, with a little peat, nodules of charcoal, freestone, and brick. Winter temp., 35° to 45°.

L. attenuat'um. 3. June. 1820.
— *ca'ndicans*. See *L. tomentosum*, var. *candicans*.
— *formosum*. 4. July. 1784. Syn., *Protea formosa*. Andr. Rep. t. 17.

— *recurva*. 2. White. June. N. America. *Andromeda recurva*.
— *spinulosa*. 2. White. May. N. America. Syn., *Andromeda Catesbaei*.

Leu'zea. (Named after *De Leuze*. Nat. ord., *Compositae*; Tribe, *Cynaroideae*. Allied to *Serratula*.)

Hardy herbaceous perennials, with purple flowers. Seeds, and divisions of the plant in spring; common garden-soil.

L. altaica. 3. August. Siberia. 1822.
— *australis*. See *Centaurea australis*.
— *carthamoïdes*. See *Centaurea carthamoïdes*.
— *conifera*. 3. July. South Europe. 1683.
— *sibirica*. 1. June. Siberia. 1817.

Levi'ticum. (From *levo*, to assuage; said to relieve flatulency. Nat. ord., *Umbelliferae*; Tribe, *Seselineae*. Allied to *Angelica*.)

Hardy herbaceous perennial. Seeds, and divisions of the plant in spring; common soil.

L. officinale. 6. Pale yellow. June. Italy. 1596. Echb. Fl. Ger. t. 1941.

Lewi'sia. (Named after *Captain Lewis*, the traveller. Nat. ord., *Portulacaceae*.)

Hardy herbaceous perennial. Seeds, and dividing the roots in spring; light, sandy loam, with brick-rubbish.

L. rediviva. 3. Rose. N. Amer. 1826. Fl. Mag. new ser. t. 82.

Leyceste'ria. (Named after *W. Leysser*, once chief justice at Bengal. Nat. ord., *Caprifoliaceae*; Tribe, *Lonicereae*. Allied to *Symphoricarpus*.)

Hardy evergreen shrub. Seeds in spring; cuttings of young, short shoots in spring, under a bell-glass, and older shoots in autumn, under a hand-light; light sandy soil; will require a few evergreen boughs over it in a very hard winter.

L. formosa. 4. White, purple. August. Temperate Himalayas. 1824. B. M. t. 3699.

Leysse'ra. (Named after *T. W. Leysser*, a German botanist. Nat. ord., *Compositae*; Tribe, *Inuloideae*.)

Greenhouse evergreens, orange-flowered, and from South Africa, except *capillifolia*. Cuttings of half-ripened shoots in sand, over sandy peat, in summer; peat and loam, both rough and sandy.

L. capillifolia. 1. Yellow. June. Barbary. 1822.

— *ciliata*. 1. August. 1816.
— *gnaphaloides*. 2. August. 1774.
— *polifolia*. 1. August. 1820.
— *squarrosa*. A synonym of *Helipterum gnaphaloides*.

Lho'tskya. (Named after *Dr. John Lhotsky*, a German botanist. Nat. ord., *Myrtaceae*; Tribe, *Chamelaucieae*. Allied to *Calythrix*.)

Greenhouse evergreens, from Swan River. Cuttings of young shoots, when the base is a little firm, in sand, and under a glass; loam, and a little peat and sand. Winter temp. 38° to 45°.

L. acutifolia. Pale yellow. June.
— *ericoides*. 2-4. White. W. Australia.
— *hirta*. A synonym of *L. ericoides*.
— *violacea*. Violet. June. 1843.

Li'abum. (Derivation not explained. Nat. ord., *Compositae*; Tribe, *Senecionideae*. Allied to *Andromachia*.)

Stove herbaceous perennial. Division in spring; sandy loam, leaf mould, and a little peat. Summer temp., 60° to 80°; winter, 48° to 55°.

- L. Bro'nsii*. Yellow. June. Jamaica. 1768.
— *uniflorum*. Yellow, orange. Peruvian Andes. 1870. Half-hardy alpine. Syn., *Paranephelius uniflorus*. B. M. t. 5826.

Lia'tris. (Derivation not known. Nat. ord., *Compositæ*; Tribe, *Eupatoriaceæ*.)

Hardy herbaceous perennials, from North America. Division in spring; sandy loam and peat; those from Carolina require protection in winter.

- L. bellidifolia*. 2. Pink. August. Syn., *Carpophorus bellidiflorus*.
— *borealis*. 1½. Pink. August. Paxt. Mag. v. t. 27.
— *corymbosa*. 3. Purple. September. Carolina. 1825. Syn., *Carpophorus corymbosus*.
— *cyllinaria*. 4. Pink. September. 1811.
— *elegans*. 4. Purple. September. 1787.

— *sphaerocarpa*. 3. Purple. September. 1817. Swt. Fl. Gard. t. 87.
— *spicata*. 6. Purple. September. 1732. B. M. t. 1411. Syns., *Cirsium tuberosum* and *Serratula spicata*. Andr. Rep. t. 401.
— *montana*. 1-1½. Leaves broader. Syn., *L. spicata* of Swt. Fl. Gard. t. 49.
— *squarrosa*. 3. Purple. July. 1732.
— *tenuifolia*. 1½. Purple. September. Carolina. 1820.
— *turbidata*. 2. Purple. September. 1823.

Libertia. (Named after M. A. Libert, a Belgian lady and botanist. Nat. ord., *Iridææ*; Tribe, *Sisyrinchieæ*. Allied to the Peacock Iris.)

Half-hardy bulbs, with white flowers, thriving well in a front, outside border, if light soil. Division of the roots, and sowing the seed, in spring; loam and peat.

- L. cærulea*. Pale blue. Chili. 1873. Gff. 759.
— *formosa*. 1½. May. Chili. 1831. B. R. t. 1630.
— *grandiflora*. 1½. April. New Zealand. 1822.
— *major*. 3. Flowers larger. New Zealand. 1870.
— *izoides*. 1. White. New Zealand. 1865. Hardy. Ref. Bot. t. 165.
— *paniculata*. 1½. April. S. Australia. 1823. B. M. t. 6263.
— *pulchella*. 1. April. S.E. Australia and New Zealand. 1823.
— *tricolor*. White; leaves coloured yellow and red. New Zealand. Syn., *Sisyrinchium versicolor*.

Libocedrus. (From *libanos*, incense, and *cedrus*, the cedar; the wood

being fragrant and like the cedar. Nat. ord., *Coniferae*; Tribe, *Cupressineæ*.)

Large evergreen trees. Tolerably hardy planted in a sheltered situation, but must be protected whilst young. Light, well-drained soil.

- L. chilensis*. 60. Chili. Paxt. Gard. i. p. 47, fig. 32. Syn., *Thuja chilensis*.
— *viridis*.
— *decurrens*. 40-140. N. California and Oregon. 1853. Syn., *Thuja gigantea*.
— *Doniana*. 60. New Zealand. 1847. Syn., *Thuja Doniana*.
— *tetragona*. 100. Patagonia. G. C. 1850, p. 439. Syn., *Thuja tetragona*.

Libonia. (In honour of M. Libon. Nat. ord., *Acanthaceæ*; Tribe, *Justicieæ*.) United with *Jacobinia* in the Genera Plantarum.

Stove shrub. For cultivation, see THUNBERGIA. SERICOBONIA (Ill. Hort. t. 198) is a hybrid between this genus and *Jacobinia Ghiesbreghtiana*. *L. floribunda*. Scarlet, yellow. Brazil. 1864.
— *penrhosiensis*. Crimson. 1870. Garden hybrid.

Lichtensteiniæ of Chamisso, not of Willdenow. (Named after Von Lichtenstein, a German botanist. Nat. ord., *Liliaceæ*; Tribe, *Anaguillariæ*.) See **Ornithoglossum**.

- L. lævigata*. See *Ornithoglossum glaucum*.
— *undulatum*. See *Ornithoglossum glaucum*, var. *undulatum*.

Licuala. (From the native name. Nat. ord., *Palmeæ*; Tribe, *Corypheæ*. Allied to *Corypha*.)

Stove palms, from the East Indies. Seeds in strong hotbed; rich, sandy loam. Summer temp., 60° to 80°; winter, 60°.

- L. gra'ndis*. Yellowish-green. February. New Britain. 1873. B. M. t. 6704. Syn., *Pritchardia grandis*.
— *pelata*. 6. White. Yellow. India. 1825.
— *spino'sa*. 6. White, green. Java. 1802. Mart. Palm. t. 135.
— *Veitchii*. Green, brown. December. Borneo. 1883. Syn., *Pritchardia grandis* of Veitch's Catalogue, 1886, p. 54.

Lidbeckia. (Named after E. G. Lidbeck, a Swedish botanist. Nat. ord., *Compositæ*; Tribe, *Anthemideæ*. Allied to *Chrysanthemum*.)

Greenhouse evergreen shrubs, with yellow flowers, from South Africa. Cuttings of half-ripened short shoots in April, in sandy peat, under a bell-glass; peat, with a little fibry loam, and a few pieces of charcoal and silver-sand. Winter temp., 40° to 45°.

- L. lobata*. 2. May. 1800. Syn., *Cotula quinqueloba*.
— *pectinata*. 2. May. 1744.

Liebigia. (Named after Liebig, the celebrated German chemist. Nat. ord., *Gesneraceæ*; Tribe, *Cyrtandreeæ*. Allied to *Æschynanthus*.) See **Chirita**.

- L. speciosa*. B. M. t. 4315. See *Chirita Horsfieldii*.

Lietzia. (Named after A. Lietze, a nurseryman at Rio Janeiro. Nat. ord., *Gesneraceæ*. Allied to *Gesnera*.)

Stove perennial with a tuberous rhizome. The flowers are remarkable for their curious form and colour. Seeds, tubers, and cuttings. The latter should be put in sand, in bottom-heat, under a frame or hand-glass; the atmosphere must be kept moist and warm. Light fibrous loam, leaf-mould and sand, well mixed and well drained. Summer temp., 80° to 80°; winter, 50° to 60°.

L. braziliensis. Green, spotted with purple-brown. Brazil. 1880. G. C. 1880, xiv. p. 752.

Lieve'na. (Named in honour of *Prince Lieven*, chief of the Imperial Botanic Gardens of Russia. Nat. ord., *Bromeliaceæ*; Tribe, *Bromeliacæ*.) See **Quesnelia**.

L. princeps. Gf. t. 1024. See *Quesnelia rufa*.

Lifting is sometimes used as meaning the same as transplanting, and at others merely means passing the spade under a plant, and, by raising it up, disturbing its roots to check its luxuriance.

An instrument has been invented by which small trees can be easily lifted for either transplanting, root-pruning, or the addition of fresh soil or manure. It consists of three parts, viz.—1. A massive fork with two curved tines, weighing from forty to sixty pounds. 2. A tubular lever, seven or eight feet long, fitting on the fork. 3. A combination of wood and iron to act as a fulcrum to the lever. The fork, being driven into the ground a short distance from the tree to be lifted, is worked by means of the lever and fulcrum, when the tree is raised with a compact ball of earth around its roots, while the longer rootlets are drawn from the surrounding soil, but not severed from the tree as in the ordinary operation of digging around. With this instrument trees twelve feet high can speedily be lifted.

Light has a most powerful influence over the health and life of a plant, from the moment its leaves pierce through the surface of the soil. If absent, they become yellow, or even white, unless iron be present in the soil, in which case they retain their verdure. It deserves notice, that it has been proved by the experiments of Dr. Hope and others, that light from artificial sources may be concentrated so as to enable plants to absorb oxygen, and perfect those elaborations on which their green colour depends; and the light of the moon has a like influence. A similar concentrated light will make the Pimpernel and other flowers, which close until sunrise, open their petals, and rouse from their rest; a fact which gives another reason why plants in rooms frequented at night become weak and exhausted sooner than

those which remain as nature dictates, unexcited by light. A deficiency of light decreases the decomposing power of the leaves. For this reason the best glass should always be employed in the sashes of the hothouse, conservatory, and other structures of the forcing department. But the benefit sought for is frustrated if that glass be not constantly well cleansed. The best glass, if dirty, allows fewer rays of light to pass through than inferior glass if kept bright. Solar light is essential to the ripening of all fruit: it will not ripen in the dark; and the greater the light's intensity, and the longer its daily endurance, the sweeter and the higher is the fruit's flavour. No fruits are so luscious as those grown within the tropics, and the fruits of the temperate zone are excellent in proportion to the brightness of its seasons. That light is essential in causing the colour of the leaves and other parts of plants has been noticed already; and it aids the ripening process of fruit in a similar manner, to convert their acid and mucilaginous constituents into sugar. How light operates in promoting this and other decompositions which are effected by the vegetable organs, is, at present, a mystery; but so it is; and the gardener promotes its access as much as lies within his power, by removing overshadowing leaves, by employing the best glasses in his hothouses, and by having their interior whitened; for white surfaces reflect nearly all the rays of light back upon the object those surfaces inclose.

Lightfootia. (Named after the *Rev. J. Lightfoot*, a Scotch botanist. Nat. ord., *Campanulacæ*; Tribe, *Campanulacæ*. Allied to *Wahlenbergia*.)

Greenhouse blue-flowered evergreens, from the Cape of Good Hope. Cuttings of young shoots in sand, containing a little peat, under a glass; fibry loam and sandy peat; pots well drained. Winter temp., 38° to 48°.

L. Loddigesii. ♀. July, 1822. Syn., *L. tenella*.
— *oxycoctoides*. ♀. July, 1787.
— *subulata*. ♀. August, 1787.
— *tene'lla*. B. C. t. 1038. See *L. Loddigesii*.

Ligularia. (From *ligula*, a strap; referring to the florets. Nat. ord., *Compositæ*; Tribe, *Senecionideæ*.) United with **Senecio** in the Genera Plantarum.

Hardy herbaceous perennials, with yellow flowers, and blooming in June. Seeds, divisions, and cuttings of the young shoots under a hand-light, in a shady corner; sandy loam, with a little leaf-mould.

L. altaica. Altaia. 1837.
— *caucasicola*. Caucasus. 1820.
— *Hodgsonii*. S. Yezo, N. Japan. 1863. B. M. t. 5417.

- L. sibirica*. Siberia. 1784.
 — *speciosa*. Siberia. 1818.
 — *thyrsoides*. Altaia. 1837.

Ligusticum. (From *Liguria*, the native country of *L. Levisticum*. Nat. ord., *Umbelliferae*.) See **Levisticum**.
L. Levisticum. See *Levisticum officinale*.

Ligustri'na. A synonym of **Syring'a**.

Ligu'strum. Privet. (From *ligulare*, to tie; referring to the use made of the flexible shoots. Nat. ord., *Oleaceae*; Tribe, *Oleinae*.)

Shrubs, all with white flowers. Generally by cuttings of the young shoots in sandy loam; seeds may also be sown, either when ripe, or placed in a rot-heap for a number of months previously. The common kinds are useful for fences, and will grow under trees where scarcely anything else would live; *lucidum* and its variety, and *vestitum*, require a little protection in exposed places.

Lilac. *Syringa*.

Liliorhi'za. See **Fritillaria**.

Lil'ium. The Lily. (From the Celtic, *li*, white. Nat. ord., *Liliaceae*; Tribe, *Tulipeae*.)

Offsets from the bulbs; also seeds, and, in some cases, small stem-bulbs; in general, light, rich, sandy loam; some, however, as those from America and Japan, like the addition of some fibry peat, and the latter are generally the better for a little loose fern or other covering in winter. They require shelter more than anything else, and should, where possible, be planted among Azaleas, Rhododendrons, etc.

Lilium Candidum. Common White Lily.

Propagation.—By offsets. When the old bulbs have several small ones formed around them, take them up in September, divide them into single bulbs, replant the large flowering-bulbs immediately into fresh, rich earth, where they are to flower. The small bulbs plant in a bed of the same kind of soil, in some corner by themselves; let them remain here for two years, then take them up, select the large bulbs, and plant them where they are to flower, taking care to enrich the earth with well-decomposed manure. The small ones may be replanted again till they are the same size, and should then be taken up and planted in the borders to bloom.

The Soil should be well drained, and fresh, maiden loam, made rich with a good coating of manure, and dug over two or three times previously to the planting season.

Winter Culture.—When the stools of bulbs have become large, they will have exhausted the soil, and it will be advisable to take them up, divide them, then dig holes, taking away the old exhausted soil, and put at the bottom of each hole a shovelful of rotten dung; fill up with fresh earth, and plant immediately three strong bulbs in each hole, covering them about three inches deep. The best time to do this is in September, and the reason for planting immediately is because these bulbs will not bear exposure to the air without injury. By this treatment they will flower well the next season, but much finer the second.

Insects.—The most troublesome are the **Wireworm** and the common **Garden slug**, which see. Whenever a leaf is observed to droop, *the grub* will be found to be the cause. Gently remove the earth near the drooping leaf, and the enemy will be discovered at work.

Diseases.—The canker sometimes attacks the bulbs. This disease arises from too much moisture in the soil. This must be corrected by draining. All cankered bulbs should be taken up and thrown away, to prevent the contagion from becoming general. A fungus (*Ovularia elliptica*) also attacks this plant.

Lilium Martagon. Martagon, or Turk's cap Lily. The propagation of all the varieties of this species is the same as described above for *L. candidum*. The soil, however, should be liberally mixed with sand. Some species, such as *L. coloratum* and *L. superbum*, require a considerable quantity of sandy peat mixing amongst the soil.

Lilium tigrinum, Tiger Lily; and **L. bulbiferum** or **aurantium**, the Orange Lily, produce at the axils of the leaves of the flower-stem a considerable number of small embryo bulbs. These afford a ready way of propagating them. Gather the bulbs as soon as they part readily from the stem; prepare a bed for them, by digging it over, and adding some well-rotted dung. Plant them in rows across the bed at three inches apart in the row, and nine inches from row to row. Let them remain in this bed for two or three years, then take them up, sort the bulbs into two sizes, plant the largest in a bed of rich earth, six inches apart in the row, and a foot between each row. Several of them will flower weakly the first year, but stronger the second, and will then be large enough to take their place amongst the old strong bulbs. The smaller-sized bulbs should be planted again rather thickly, and will afford a second crop of flowering bulbs the second year. The other points of summer and winter culture are similar to those required by *L. candidum*, excepting in one particular. As the flower-stems advance in growth, they put forth a number of young roots from the stem above the bulb; when that is perceived, place round each stem some rough, hard pieces of dung for these roots to strike into; this will encourage the flower-stems to grow strongly, and flower finely, besides increasing very much the size of the bulbs below.

Lilium speciosum and its varieties. This is the finest of all the genus. The petals turn back, like those of the *L. martagon*. It throws out roots above the bulbs like *L. tigrinum*, but does not produce incipient bulbs in the axils of the leaves, like the latter species, and must, therefore, be propagated like *L. candidum*, by offsets. This fine species, although quite hardy, is well worthy of being cultivated in pots to bloom in the greenhouse, everywhere in this country, flowering in June and July, when the generality of the usual inhabitants are enjoying the open air. To cultivate it for that purpose, pot the

larger bulbs in eleven-inch pots. If bulbs are plentiful, put three in each pot. Do this early in March, and use a rich, sandy compost. Place them in a pit or frame sheltered from frost, by covering with mats, giving plenty of air in mild weather, but very little water. *Grow them as slowly as possible*, so that they may have a large supply of roots to cause a strong growth. When the frosts are over, plunge them in a bed of old tan till the greenhouse is thinned of its plants, and then bring them into their place; put pans under the pots, and a mulching of dung on the surface of the soil. Water freely, and give plenty of air. The culture in the air is the same as is required by *L. candidum*, with the addition of a covering of dry fern fronds over the bulbs in winter.

Lily. *Lilium.*

Lily-hyacinth. *Scilla lilio-hyacinthus.*

Lily-of-the-valley. (*Convallaria majalis.*) We know gardens where no one can flower the lily-of-the-valley well, and we also know places where it flowers in the greatest abundance without any care whatever. We have seen it growing naturally by the acre, in a shady wood, the soil being mere sand, enriched by the fallen leaves; we have dug it out in that wood, and found all the roots within three inches of the surface. We have also seen it flower abundantly on a south border, in a rich kitchen-garden soil. Where it refuses to succeed we would make a bed for it on the north side of a wall; dig out the natural soil a foot deep, and drain the bottom; then fill up the bed with a compost of light, sandy earth and rotten leaves, half of each; press it down gently when within two inches of the top; then lay the roots regularly, four inches apart, all over this surface, and then cover them two inches deep, and give them a good watering with a rose-pot; and, after that, we would cover the whole with an inch of quite rotten leaves, and water them once a week the following summer. February, or early in March, is the best time to plant them; and the third season they are in full perfection, and will last for ten or a dozen years.

Forcing.—Pot them in thirty-two-sized pots, filled to within three and a half inches of the rim with rich loam, upon which the roots are closely placed, and then covered about two inches in thickness with equal parts of leaf-mould and sand; they are then well watered,

so as to settle the mould about the roots; place them on a shelf near the glass, in a moist stove or forcing-house, the temperature of which may range from 65° to 75°, and take care that the soil does not become dry. When they are so far advanced that the plants show their heads of flowers, remove them into a warm greenhouse, still placing them near the glass, until, as they advance in growth, they are withdrawn by degrees into a shaded part of the house, from whence they are removed to the drawing-room as required, their places to be immediately filled with others, which are similarly treated, and thus an ample succession will be kept up. Care and attention are requisite in lifting and selecting the plants for forcing; they require a minute examination to distinguish those that will flower from those that will not, the only difference being that the buds of the former are more round and short than those of the latter. — *Florists' Journ.*

Lily-pink. *Aphyllanthes*.

Lily-thorn. *Catesbaea*.

Limato'des. (Not explained. Nat. ord., *Orchidæ*; Tribe, *Epidendrææ*.) The majority of the species included in this genus are referred to **Phaius**; the three in cultivation, however, are included in **Calanthe**.

L. gracilis. See *Calanthe gracilis*.

— *labrosa.* Yellowish-brown, purple. Moulmein. 1879. A synonym of *Calanthe labrosa*.

— *rosea.* B. M. t. 5312. See *Calanthe rosea*.

Lime. *Citrus lime'tta*.

Lime is valuable as a manure, for some one or more of its salts enter into the composition of every vegetable. But it is not the lime of every district that is suitable for the purpose. Some specimens contain a very large proportion of magnesia, which, absorbing carbonic acid very slowly, remains in a caustic state, to the injury of the roots of the plants, and the diminution of benefit from the carbonic acid evolved by the decomposing constituents of the soil. Neither can the gardener apply it to all his soils with advantage. Thus, peat and bog earth are beneficial to the plants grown upon them by their containing gallic and other acids, which lime removes. To garden-soil of the usual staple about fifty bushels of lime per acre is a sufficient quantity. If the soil be clayey the quantity may be doubled. A very excellent manure is formed by mixing one bushel of salt with every two bushels of lime. Lime cannot be

applied to the soil too fresh from the kiln; for if allowed to absorb carbonic acid from the air, it is rapidly converted into chalk.

When crops are devastated by the slug, dress them, some evening, so as to render the surface of the soil quite white, with caustic lime, during the promise of a few days' dry weather. It is instant destruction to every slug it falls upon; and those that it misses are destroyed by their coming in contact with it when moving in search of food.

Lime-rubbish is the old mortar and plaster obtained when brick-buildings are pulled down. It is an excellent manure, abounding with the salts of potash and lime. It should be reduced to powder before spreading and digging in.

Lime, or Linden-tree. *Tilia*.

Lime-looper Moth. *Geometra*.

Lime-water. To forty gallons of clear water, half an hour before using, put one peck of fresh-slaked lime. As soon as it is clear it is fit for use.

A watering-pot containing four gallons will water a bed of four feet by thirty feet, or rows of cauliflowers, cabbages, etc., of double the length.

Limna'nthemum. (From *limne*, a marsh or pool, and *anthemon*, a blossom; from the situations in which they grow. Nat. ord., *Gentianaceæ*; Tribe, *Menyantheæ*.)

White or yellow-flowered aquatics or marsh-plants. For cultivation, see **VILLARSIA**, to which they are allied.

L. Humboldtiana. White, yellow. Summer. Tropical America. 1856. Stove.

— *nymphaeoides*. Yellow. Summer. Europe. Hardy. Eng. Bot. ed. 3, t. 921. Syn., *Menyanthes indica*. B. M. t. 658.

Limna'nthes. (From *limne*, a marsh, and *anthos*, a flower. Nat. ord., *Geraniaceæ*; Tribe, *Limnantheæ*.)

Hardy trailing annuals, from California. Seeds in April, in a moist and shady situation.

Limo'nia. (From *limoun*, the Arabic name of the citron. Nat. ord., *Rutaceæ*; Tribe, *Aurantieæ*.)

Evergreens, with white flowers. Seeds in a hotbed, and seedlings grafted the same season, with the most desired varieties; cuttings of any shoots, young or ripened, in spring or summer, in sandy soil, under glass, and in a few weeks plunged in bottom-heat; peat, loam, dried cowdung, and a few pieces of charcoal. For *crenula'ta*, winter temp., 35° to 45°; summer, 60° to 75°; the others may succeed against a wall, in the south of England, protected in winter; and in other districts they require a greenhouse.

- L. acid'i'simo.* 4. E. Indies. 1800. Syn., *L. crenulata*.
 — *austra'lis.* See *Citrus australis*.
 — *citri'folia.* 4. China. 1800. Syn., *Glycosmis pentaphylla*, var. *chinensis*.

Ling, or Ling-heather. *Calluna vulgaris*.

Linings, or, as they might be more properly called, *Coatings*, are applications of fermenting dung to renew the heat in hotbeds made of dung. See **Hotbed**.

Linnæ'a. (Named after *Linnæus*. Nat. ord., *Caprifoliaceæ*; Tribe, *Lonicereæ*. Allied to *Abelia*.)

Hardy trailer. Plants are easily obtained from its trailing-rooted stems. It should, whether in the front of a border or in a good sized pot, be grown solely in peat or heath-soil, kept in shade.
L. borea'lis. $\frac{1}{2}$. Flesh. June. Scotland. Eng. Bot. ed. 3. t. 644.

Linosyris. (Derivation not stated. Nat. ord., *Compositæ*; Tribe, *Asteroidæ*.) A synonym of **Aster**.

L. villosa. See *Felicia villosa*.

— *vulgaris.* See *Aster Linosyris*.

Linum. Flax. (From *linon*, flax. Nat. ord., *Linaceæ*.)

Annals and biennials, by seed in the open border, in April; perennials, by seed, but principally by divisions in spring, and cuttings of young shoots under a hand-light; hardy shrubs, by cuttings in sandy soil, under a hand-light, in summer; greenhouse shrubs, cuttings in sand, under a bell-glass; for the latter, peat and loam. Winter temp., 38° to 45°. Many, however, such as *arborescens*, *salsoloides*, *tauricum*, etc., will thrive in the border, in the South of England, with but little protection.

Lion's Ear. *Leontotis*.

Lion's Foot. *Leontopodium*.

Lion's Tail. *Leontotis leonurus*.

Liparia. (From *liparos*, unctuous; referring to the shining leaves. Nat. ord., *Leguminosæ*; Tribe, *Genistee*. Allied to *Priestleya*.)

Greenhouse evergreens, with orange flowers, from the Cape of Good Hope. Cuttings of young shoots in sand, under a bell-glass, but care taken to prevent damping; fibry loam and turfy peat, with sand and a little charcoal; watering and draining carefully attended to. Winter temp., 40° to 45°.

- L. parva.* 2. March. 1843. B. M. t. 4034.

Li'paris. A genus of moths, the best known species of which is *L. di'spar*, the Gipsy Moth, which often greatly damages hawthorns, plums, apples, and other Rosaceae trees. The males are dark brown, with transverse zigzag lines and a central spot on the front wings. The females are much larger, with thicker bodies, and whitish wings with zigzag lines. On account of their large size they can be destroyed by hand-picking.

Lipo'stoma. (From *leipo*, to fall off, and *stoma*, mouth; referring to the lid of the capsule. Nat. ord., *Rubiaceæ*; Tribe, *Mussendeæ*. Allied to *Pentas*.) See **Coccocypselum**.

L. campanuliflo'ra. See *Coccocypselum campanuliflorum*.

Li'ppia. (After *Augustus Lippi*, a French traveller in Abyssinia. Nat. ord., *Verbenaceæ*. Syn., *Aloysia* and *Zapania*.)

Greenhouse deciduous shrubs. Rich mould; cuttings in sandy soil of the old stem, or young shoots; if the latter, shade is required; August and March best times.

- L. asperifolia*. 2. Red. July. S. America. 1820. Syn., *Lantana lavandulacea*. Jacq. H. Schoenb. t. 361.
- *citriodo'ra*. 3. Pale purple. August. Chili. 1784. Syn., *Aloysia citriodora*, B. M. t. 367, and *Verbena triphylla*.
- *nodiflo'ra*. 1. White or purple. Summer. N. America. Half-hardy. Syn., *Zapania nodiflora*.
- *re'ptans*. 1. White, red. June. S. America. 1847.

Liquida'mbar. (From *liquidus*, liquid, and *ambar*, amber; referring to the gum called liquid storax produced by some species. Nat. ord., *Hamamelidææ*. Allied to *Altingia*.)

Hardy deciduous trees. Cuttings, but chiefly layers; also by imported seeds, which should not be taken out of the catkins until they are to be sown; if exposed to sun or fire-heat, the catkins crack, and the seeds easily shake out. They often require a year to send up their seedlings; moist, loamy soil.

- L. imbe'rbe*. 6. March. Levant. 1759. Syn., *L. orientalis*.
- *orienta'lis*. See *L. imberbe*.
- *styraci'flua*. 60. March. N. Amer. 1633.

Liquid-Manure is the most advantageous form in which fertilizers can be applied by the gardener to his crops. It is the most economical, most prompt, and most efficient mode. The manure is presented to the roots in one of the only forms in which they can imbibe food, and the manure is spread regularly through the texture of the soil. If, instead of digging-in stable-manure, each crop was watered occasionally with liquid-manure, the produce would be finer and more abundant.

"I have often employed with decided effect, in my own garden, for vines, peach, and standard apple-trees, liquid-manure, prepared either by mixing one part by weight of cow-dung with four parts of water, or the collected drainage of the stable and cow-house. It has been found advantageous to plants cultivated in stoves to apply even a liquid-manure, composed of six quarts of soot to a hogshhead of water; and although this is a very unchemical mixture, yet it has been found by Mr. Robertson to

be peculiarly grateful and nourishing to pines, causing them to assume an unusually deep, healthy green; and, for stove mulberry, vine, peach, and other plants, the late Mr. Knight, of Downton, employed a liquid-manure, composed of one part of the dung of domestic poultry and four to ten parts of water, with the most excellent result."—*Johnson on Fertilizers.*

Guano Liquid-Manure.—Ten gallons of water will readily dissolve, or keep suspended in a state of minute division, about 50lbs. weight of guano. When applied to plants not more than five ounces should be added to that quantity of water. If it be made stronger, it injures or kills the plants to which it is applied.

Sheep's-dung, if employed for making liquid-manure, should be a peck to thirty gallons.

When **cow-dung** is used, boiling water should be first poured upon it, as it is apt to be full of destructive larvæ.

Sulphate of ammonia, and any other salt of ammonia, must not be used more than a quarter of an ounce to each gallon.

The rule applicable to all these liquid-manures is—*Give it weak and often.*

Liquiri'tia officina'lis. A synonym of **Glycyrrhiza glabra.**

Liquorice. *Glycyrrhiza.*

Liriode'ndron. Tulip-tree. (From *lirion*, a lily, and *dendron*, a tree. Nat. ord., *Magnoliaceæ*; Tribe, *Magnoliææ.*)

Hardy deciduous tree, with yellow and red flowers, from North America. Generally by seeds, which, if sown in the autumn, usually come up the succeeding spring, but if sown in spring, generally remain a year in the ground; varieties by layers, grafting, and budding; deep, rich, loamy soil.

L. tulipifera. 60. June. 1663.

— *obtusifolia.* 60. June. 1663.

Liri'ope. (After the nymph *Liriope*. Nat. ord., *Hæmodoraceæ.*)

Hardy or half-hardy, ornamental foliage plant. Same treatment as *OPHIOPOGON.*

L. graminifolia. $\frac{1}{2}$ -1. Violet. October. China and Japan. 1821. Syn., *Ophiopogon spicatus.* B. M. t. 5348.

Lisia'nthus. (From *lysis*, dissolution, and *anthos*, flower; a powerful cathartic is obtained from this genus. Nat. ord., *Gentianææ*; Tribe, *Chironiææ.* Syn., *Lisyanthus.*)

Seeds in spring, in a hothed, and cuttings of shrubby kinds in sandy soil, under a bell-glass; sandy loam and peat. Summer temp., 60° to 80°; winter, 50° to 55°. Young plants raised in heat one year, and safely kept over the winter in a cool stove or a warm greenhouse, and potted in spring, will bloom beautifully in summer.

EXCLUDED SPECIES.

- L. cordifolius.* See *Leianthus cordifolius.*
— *glancifolius.* See *Eustoma exaltatum.*
— *latifolius.* See *Leianthus latifolius.*
— *longifolius.* B. R. t. 880. See *Leianthus longifolius.*
— *ophiorhiza.* See *Metternichia principis.*
— *Russellianus.* B. M. t. 3626. See *Eustoma Russellianum.*
— *umbellatus.* See *Leianthus umbellatus.*

Lissanthe. (From *lissos*, smooth, and *anthos*, a flower. Nat. ord., *Epicridaceæ*; Tribe, *Stypheliææ.* Allied to *Leucopogon.*)

Greenhouse evergreen shrubs, with white flowers, except *verticillata*, and all from Australia. Cuttings of the points of shoots in April and May, in sand, under a bell-glass; chiefly sandy, fibry peat. Temp., 40° to 45°, when resting and flowering; a higher temperature and a closer atmosphere, when making their wood, after flowering and pruning.

- L. ciliata.* 3. June. 1825. A synonym of *Brachyoloma ciliatum.*
— *daphnoides.* 3. June. 1818. B. C. t. 466. A synonym of *Brachyoloma daphnoides.*
— *sapida.* 4. June. 1824. B. M. t. 3147.
— *stellata.* April. 1836. A synonym of *Brachyoloma daphnoides.*
— *strigosa.* 3. June. 1824.
— *subulata.* 2. May. 1823.
— *verticillata.* See *Leucopogon verticillatus.*

Lisso'chilus. (From *lissos*, smooth, and *cheilos*, a lip. Nat. ord., *Orchidææ*; Tribe, *Vandææ-Eulophiææ.* Allied to *Cyrtopera.*)

Stove orchids. Division in spring, when fresh growth commences and potting takes place; fibry peat, a little fibry loam, dried leaf-mould, and plenty of drainage. Summer temp., 60° to 90°; winter, 55° to 60°.

- L. dilectus.* 2-3. Rosy; lip purple. Congo. 1886.
— *giganteus.* G. C. 1888, iii. p. 617, fig. 83. See *Eulophia gigantea.*
— *Horsfallii.* Purplish brown, white. Old Calabar. 1865. B. M. t. 5486.
— *Krebsii.* 2. Green, purple, yellow. Natal. 1867. B. M. t. 6861.
— *lutens.* 1 $\frac{1}{2}$. Yellow. May. Cape of Good Hope. 1822.
— *parviflorus.* 1. Pale red. December. Algoa Bay. 1822. Maund Bot. t. 172. A synonym of *Eulophia parviflora.*
— *roseus.* Rose. February. Sierra Leone. 1841. B. R. 1844, t. 12.
— *Sandersoni.* 6-7. White; lip green with brownish veins, violet. June. Natal. 1879. B. M. t. 6858.
— *speciosus.* 2. Yellow. June. Cape of Good Hope. 1818. B. R. t. 573.

L. streptopetalus. Yellow. December. Cape of Good Hope. 1826. Syn., *Eulophia streptopetala*, B. M. t. 2931.
— *stylites*. Rose. Comoro Islands. 1885.

Listrosta'chys. This does not appear to differ from **Angræcum**, under which we include the species.

Lists, for fastening trees against walls, are usually merely shreds of woollen cloth cut into lengths, varying from two to four inches. Strips of very thin sheet-lead are preferable, as not harbouring insects. Wires and twine have been recommended to tie the branches to the walls; but the process is tedious, and cuts are inflicted, inducing gum and canker. Shreds of a black, blue, or red colour look best, harmonizing with that of the leaves. If old lists are re-employed, they should be previously boiled, to destroy the larvæ of insects.

Litanthus. (From *litos*, small, and *anthos*, a flower; from the small size of the plant. Nat. ord., *Liliaceæ*; Tribe, *Scilleæ*. Allied to *Drimia*.)

A minute greenhouse bulb; probably the smallest known Liliaceous plant, which, despite its small size is very pretty when a number of bulbs are grown in one pot. It should be grown in light sandy loam, and treated like *Scilla* and other Cape bulbs.

L. pusillus. $\frac{1}{2}$. White. August. S. Africa. 1870. B. M. t. 5995.

Lithospermum. Gromwell. (From *lithos*, a stone, and *sperma*, a seed. Nat. ord., *Boraginææ*; Tribe, *Borageæ*. Allied to *Echium*.)

Annuals and biennials, by seed in common garden-soil, in April; perennials, by division, seed, and cuttings of young shoots; shrubby species, by cuttings, and by seeds; indeed, all of them will soon multiply themselves by seeds in suitable places; *scabrum* and *distichum* will require protection in winter, and a little peat added to the loam.

HARDY ANNUALS, ETC.

L. dispermum. See *Rochelia stellulata*.
— *lineatum*. 1. Purple. July. Greece. 1826. Biennial.
— *tenuiflorum*. $\frac{1}{2}$. Blue. May. Egypt. 1796. Syn., *L. ægyptiacum*.

HARDY EVERGREENS.

L. graminifolium. $\frac{3}{4}$. Blue. May. Italy. 1825.
— *petraeum*. B. M. t. 5922. See *Moltkia*.
— *prostratum*. 1. Blue. June. France. 1825. Trailing.
— *rosmarinifolium*. $\frac{1}{2}$. Blue. September. Italy. 1833. B. R. t. 1736.

HARDY HERBACEOUS.

L. canescens. $\frac{3}{4}$. Orange. May. Canada. 1847. B. M. t. 4389. Syn., *Batschia canescens*.
— *distichum*. $\frac{1}{2}$. Yellow, white. May. Cuba. 1806. Half-hardy.
— *fruticosum*. 2. Blue. May. South Europe. 1683. Belg. Hort. 1866, t. 2.
— *gastroli*. $\frac{1}{2}$. Blue, white, purple. Pyrenees. 1871. B. M. t. 5926.
— *hirtum*. 1-2. Orange. N. United States and Canada. 1812. Syns., *Batschia Gmelini* and *B. carolinensis*.

L. latifolium. 2. Yellow. June. N. Amer. 1825. Syn., *L. officinale*, var. *latifolium*.
— *officinale*. 2. Yellow. June. Britain. Eng. Bot. ed. 3, t. 1101.
— *latifolium*. See *L. latifolium*.
— *orientale*. 2. Yellow. June. Levant. 1713. B. M. t. 615. A synonym of *Alkanna orientalis*.
— *purpureo-cæruleum*. 1. Purple. May. England. Eng. Bot. ed. 3, t. 1100.
— *scabrum*. $\frac{1}{2}$. White. September. Cape of Good Hope. 1822. Half-hardy.
— *sericeum*. $\frac{1}{2}$. Yellow. July. N. Amer. 1825. Syn., *Batschia sericea*.
— *strigosum*. 1. Blue. July. Tauria. 1820.
— *tinctorium*. $\frac{1}{2}$. Blue. July. South Europe. 1596. Andr. Rep. t. 576. A synonym of *Alkanna tinctoria*.
— *villosum*. 1. Blue. July. South France. 1817.

Li'threa. (From *lythron*, black blood; referring to the juice staining black. Nat. ord., *Anacardiaceæ*.) See **Rhus**.

L. castica. } See *Rhus castica*.
— *venenosa*. }

Li'tbro'chia. (A commemorative name. Nat. ord., *Filices*.) By some authors regarded as a section of **Pteris**.

Stove fern. See **FERNS**.

L. aculeata. 10. Brown. August. W. Ind. 1793.
— *alcyonisa*. Brazil. 1864.
— *ampla*. Brown, pale yellow. May. W. Ind.
— *areolata*. E. Indies. 1860.
— *aurita*. Brown, yellow. July. Isle of Luzon.
— *biarrita*. 4. W. Indies. 1842.
— *comans de nsa*. New Caledonia. 1879.
— *davallioides*. Yellow. May.
— *decurrens*. Brown, yellow. July. Brazil.
— *denticulata*. 2. Brown. July. Brazil. 1824.
— *elata*. Tropical America.
— *grandifolia*. 2. Brown. August. W. Ind. 1793.
— *Hankea'na*. Brown, yellow. June.
— *hirsuta*. 1. Brown. June. W. Ind. 1793.
— *intermedia*. Brown, yellow. June. Isle of Luzon.
— *leptophylla*. 2. Brown. July. Brazil. 1824.
— *macroptera*. Brown, yellow. June. W. Ind.
— *no'bilis*. 2. Brazil. 1862.
— *orizabæ*. Mexico. 1858.
— *pedata*. 1. Brown. June. Jamaica. 1793.
— *podophylla*. Brown, yellow. June. W. Ind.
— *poli'ta*. 6. Brown, yellow. May. Jamaica. 1841.
— *robusta*. Clear green. 1884.
— *spinulosa*. Brown, pale yellow. W. Ind.
— *splendens*. Brown, pale yellow. June. W. Ind.
— *tripartita*. India. 1865.
— *undulata*. Fiji Islands. 1867.
— *vespertilio'nis*. 3. Brown. May. N. Holland. 1823.

Litsæ'a. (From the Japanese name. Nat. ord., *Laurinææ*; Tribe, *Litsæeæ*. Syn., *Tetranthera* in part.)

Half-hardy trees, requiring some culture as LAURUS.

L. geniculata. 6. Yellow. May. S. United States. 1759. Syn., *Laurus geniculata*, B. M. t. 1471, and *Tetranthera geniculata*.
— *glauca*. Whitish. Summer. Japan. Leaves silvery beneath.
— *japonica*. 3. White. Japan. 1813.

L. Tetra'nthera. 8. Green, yellow. April. N. Holland. 1824. Syns., *L. citrifolia*, *Tetranthera apctata* and *I. laurifolia*. Jacq. H. Schoenb. t. 113.

Littæ'a. (Named after the Duke of Litta, near Milan. Nat. ord., *Amaryllidææ*; Tribe, *Agaveæ*.) Now united with **Agave**.

Greenhouse evergreen. Suckers; sandy loam and leaf-mould, and a little dried cow-dung. Winter temp., 40° to 45°.

L. geminiflora. A synonym of *Agave geminiflora*.

Litto'nia. (In honour of Dr. S. Litton, professor of botany, Dublin. Nat. ord., *Liliacææ*; Tribe, *Uvulariææ*.)

A stove bulb. Offsets. Light rich soil.

L. mode'sta. 2½. Orange. April. S. Africa. 1853. B. M. t. 4723.

— — *Keitii*. Orange. More robust than the type. Gf. t. 1237.

Livery. Soil that is dug or moved about whilst wet is liable to set close together like mortar, and is said to be livery, or like liver.

Livisto'na. (Named after P. Murray, of Livingston, near Edinburgh. Nat. ord., *Palmeææ*; Tribe, *Coryphææ*. Allied to *Corypha*.)

Greenhouse palms. Seeds in a hotbed; rich, sandy loam. Summer temp., 60° to 80°; winter, 50° to 60°.

L. alti'ssima. Sunda Islands. 1868. Fl. Ser. t. 1740.

— *australis*. 80. Whitish. E. Australia. Gf. 1872, p. 50.

— *borbo'nica*. Isle of Bourbon. 1818.

— *en'er'mis*. 1891. Perhaps the same as *L. inermis*.

— *Hoogend'rpiti*. Sara. 1874. III. Hort. 1874, t. 174.

— *humi'lis*. 6. Australia. 1824. Mart. Palm. tt. 109 and 111.

— *in'er'mis*. 10. Australia. 1824. Mart. Palm. tt. 145-6.

— *Jenki'nsii*. Assam. 1845.

Lla'vea. (In honour of M. la Llave, the discoverer of the only known species. Nat. ord., *Filices—Polypodiæææ*.)

Stove ferns. See FERNS.

L. cordifolia. 2. Mexico. 1858.

Lloydia. (Named after Mr. Lloyd, an English botanist. Nat. ord., *Liliacææ*; Tribe, *Tulipeææ*. Allied to *Calochortus*.)

Hardy perennial bulb. Offsets in epring; a dry, sandy loam suits it best.

L. sero'tina. White striped with red. May. Alpine Europe. 1789. Eng. Bot. ed. 3, t. 1520. Syn., *L. striata*.

Loam is a very indefinite term, almost every cultivator of the soil associating it with a different explanation. In some parts of England *clay* is so called, and in others it is employed to designate *brick-earth*! As usually employed, it really is only synonymous with the word soil; for it has to be qualified by the terms *turfy*, *sandy*,

clayey, and *chalky*, just as *turf*, *sand*, *clay*, or *chalk* predominates. *Hazel loam* is a rich, friable soil, having a dark brown, or hazel colour, owing to the predominance of decaying vegetable matters.

In this work we use the term *loam* to describe a soil that is easily worked at any season, being sufficiently retentive, yet not too retentive, of water. *Maiden loam* is used often among gardeners to describe the fat earth forming the top spit of pasture-ground, and used by them for composts: that with a yellowish-brown colour is most preferred. *Sandy loams* are the easiest worked, and yield the earliest produce; *chalky loams*, if the chalk does not abound too much, are early and fertile; in fact, no soil will continue fertile without calcareous matter; and *clayey loams* are bad to work, in wet or dry weather, being wet and sticky in the one case, and hard and cracking in the other. Fine late crops, however, are produced from such soils, especially when the surface is moved to prevent cracking in hot weather.

Loa'sa. (Meaning unknown; probably a commemorative name. Nat. ord., *Loasacææ*. Very closely allied to *Blumenbachia*.)

Curious flowers, that would be very interesting were it not for the poisonous, stinging property possessed by the leaves. The annoyance and danger combined have limited their culture. They will all fare the better by being raised in a gentle hothed in April, though most of them will flower freely if sown in a warm place the end of that month; but in a cold autumn they would be cut down in their prime; light soil.

ANNUALS.

L. acanthifolia. See *L. Placæi*.

— *a'ba*. 1. White. July. Chili. 1831. Swt. Fl. Gard. ser. 2, t. 192.

— *bi'color*. White, red. July. Central America. 1852.

— *grandiflora*. 2. Yellow. Peru. 1825.

— *hi'spida*. 2. Yellow. July. Lima. 1830. B. M. t. 3057.

— *ni'tida*. 2. Yellow. July. Chili. 1822. Swt. Fl. Gard. ser. 2, t. 195. Syn., *L. tricolor*, B. R. t. 667.

— *pa'tula*. 1. Yellow. July. Chili. 1827.

— *pi'cta*. White, yellow. July. Peru. 1848. B. M. t. 4423.

— *Pla'cei*. 4. Yellow. July. Chili. 1822. B. M. t. 3218. Syn., *L. acanthifolia*. B. R. t. 785.

— *prostrata*. Yellow, red. Chilian Andes. 1879. B. M. t. 6442.

— *Schlimi'na*. 2. Yellow of two shades. Sierra Nevada. Fl. Ser. t. 1001.

— *tri'color* of B. R. t. 667 is *L. ni'tida*.

— *volu'bilis*. B. M. t. 5028. See *Grammatocearpus volubilis*.

— *vulca'nica*. 2. White, red, yellow. Summer. Ecuador. 1877. B. M. t. 6410.

— *Wall'i'sii*. 1½. White, red. Andes of Columbia. 1879. Gf. t. 958.

GREENHOUSE BIENNIALS.

L. lateri'tia. B. M. t. 3632. See *Blumenbachia lateritia*.

L. Pentlandii. 4. Orange. August. Peru. 1840. Syn., *Catophora lateritia*. B. M. t. 3632.

GREENHOUSE EVERGREENS.

L. inca'na. 2½. White. October. Peru. 1820. B. M. t. 3048.

— *lu'cida*. White. June.

Loaving. See Heading.

Lobe'lia. (Named after *M. Lobel*, a botanist, physician to James I. Nat. ord., *Campanulaceæ*; Tribe, *Lobelieæ*. Syns., *Rhynchopetalum* and *Tupa*.)

Seeds of hardy kinds in open border, in April; greenhouse annuals and biennials, by seed in hotbed, in April; herbaceous kinds, whether hardy or requiring protection, by dividing the roots or suckers in spring, after growth has commenced; shrubby kinds, by small cuttings of the young shoots; indeed, all of them may be so propagated; sandy loam, leaf-mould, and a little peat suit the tenderest kinds, and for the strong-growing, herbaceous sorts, such as *spl'ndens* and *cardina'lis*, it is scarcely possible to make the soil too rich by top-dressings of rotten dung; the soil itself should be light. The finest of the species must be kept in a cold pit or greenhouse during the winter; *lacu'stris* has been grown in peat and gravel, in a pot, plunged in a cistern or slowly-running stream.

HARDY ANNUALS.

L. a'niceps. ½. Blue. June. Cape of Good Hope. 1818.

— *campanula'ta*. ½. Blue. June. Cape of Good Hope. 1821.

 — *hybrida*. B. M. t. 3604.
 — *tenebra*. †. Purple, violet. May. South Africa. 1821. Syn., *Parastranthus undentatus*.

Loblolly-bay. *Gordonia lasianthus*.

Loche'ria. See *Achimenes*.

Lockhartia. (In honour of Mr. David Lockhart, a traveller and the introducer of *L. elegans*. Nat. ord., *Orchideæ*; Tribe, *Vandee-Sarcantheæ*.)

Stove epiphytes; should be grown on blocks. For cultivation, see ORCHIDS.

- L. acuta*. †. Yellow. June. Trinidad. 1834. Syn., *Fernandezia acuta*. B. R. t. 1806.
 — *amœna*. Yellow, purple. Costa Rica.
 — *elegans*. †. Yellow, purple. Trinidad. 1827. B. M. t. 2715. Syn., *Fernandezia elegans*. B. C. t. 1214.
 — *humifera*. Yellow. July. Brazil. 1839.
 — *paludosa*. †. Yellowish-orange. 1854.
 — *verrucosa*. 1. Yellow, red. Guatemala. 1841. Ref. Bot. t. 76. Syn., *Fernandezia robusta*. B. M. t. 5592.

Locust-tree. *Hymenoclea*.

Loddigesia. (Named after Conrad Loddiges, the founder of the well-known nursery at Hackney. Nat. ord., *Leguminosæ*; Tribe, *Genisteæ*. Allied to *Hypocalyptus*.)

Greenhouse evergreen. Cuttings of the points of the shoots in April, in sandy soil, under a

bell-glass; sandy peat and a little loam. Winter temp., 40° to 48°; a cool place in summer.

L. ovalifolia. 1‡. Pale purple. June. Cape of Good Hope. 1802. B. M. t. 965.

Lodoicea. Double Cocoa-nut or Coco de Mer. (Named after *Laodice*, the daughter of Priam and Hecuba. Nat. ord., *Palmecæ*.)

Stove palm. Seeds in a strong, moist heat; loam and peat. Summer temp., 60° to 90°, with plenty of moisture in the atmosphere; winter, 58° to 60°.

L. seychellarum. 60. Seychelles Islands. B. M. t. 2734.

Loese'lia. (After John Loesel, a Prussian botanist. Nat. ord., *Polemoniaceæ*. Syn., *Hoitzia*.)

Greenhouse shrubs, or undershrubs. Fibry peat and sandy loam. Cuttings in sand, under a bell-glass.

L. coccinea. 3-4. Scarlet. June. Mexico. 1824. Gff. t. 643. Syns., *Hoitzia coccinea*. Kn. and West. t. 99, and *H. mexicana*.

— *cœrulea*. 1. Blue. June. Mexico. 1824. Syn., *Hoitzia cœrulea*.

— *glandulosa*. 2. Red. June. Mexico. 1825. Syn., *Hoitzia glandulosa*.

Loga'nia. (Named after J. Logan, a distinguished botanist. Nat. ord., *Loganiaceæ*; Tribe, *Euloganiææ*. Allied to *Fagraea*.)

Greenhouse evergreens, with white flowers, from Australia. Stiff side-shoots, getting well ripened at the base, in sandy soil, under a bell-glass, in summer; sandy loam and fibry peat, kept more open still by pieces of charcoal. Winter temp., 38° to 45°. In summer the pots must be plunged in ashes.

L. floribunda. 2. April. 1797. B. C. t. 1118. Syn., *Euosma albiflora*. Andr. Rep. t. 520.

— *latifolia*. 3. 1816.

— *revoluta*. 2. 1826.

Logwood. *Haematoxylon*.

Loiseleu'rea. (Named after *Loiseleur Deslongchamps*, a celebrated French botanist, who died in 1849. Nat. ord., *Ericaceæ*; Tribe, *Rhodoreæ*. Syns., *Chamæcistus* and *Chamaedon*.)

A hardy, prostrate shrub cultivated like the hardy species of *AZALEA*.

L. procumbens. †. Pink. Late summer. Mountains of N. Europe (Scotland). Eng. Bot. ed. 3, t. 882. Syns., *Azalea procumbens* and *Chamaedon procumbens*.

Lomag'ramma. (From *loma*, an edge, and *gramma*, writing; referring to the appearance and position of the spore or seed-cases on the leaves. Nat. ord., *Filices*.)

Stove fern. See FERNS.

L. pteroides. Brown. May. Isle of Luzon. 1840. An abnormal form of *Acrostichum Blumeanum*.

Loma'ria. (From *loma*, an edge; referring to the position of the spore or

seed-cases on the leaves. Nat. ord., *Filices*.)

All brown-spored. See FERNS.

Lonchocarpus. (From *lonche*, a lance, and *carpos*, a fruit; shape of seed-pod. Nat. ord., *Leguminosae*; Tribe, *Dalbergiaceae*. Allied to *Dalbergia*.)

Stove evergreen trees, with purple flowers, except where specified otherwise. Cuttings of half-ripened shoots in sand, under a bell-glass, and in a sweet bottom-heat, in May; turfy loam and fibry peat, with sand and charcoal to keep it open, though pressed firmly together. Summer temp., 60° to 85°; winter, 55° to 60°.

bro'sa.

Loni'cera. (Named after Adam
Lonicer, a German botanist. Nat. ord.,
Caprifoliaceae; Tribe, *Caprifoliaceae*. Al-
 lied to *Caprifolium*.)

Hardy deciduous shrubs. By cuttings and
 layers in the autumn; with all the succulent,
 pithy-stemmed kinds, the latter mode is the
 best, as cuttings are apt to rot; when planted
 they should have a shady, sheltered situation;
 good, loamy soil.

Lophanthus. (From *lophos*, a crest, and *anthos*, a flower; referring to the middle lobe of the flower. Nat. ord., *Labiatae*; Tribe, *Nepeteae*. Allied to *Nepeta*.)

Hardy herbaceous perennials, from North America, except *L. chinensis*. Seeds sown in April; cuttings of the young shoots at the same time, in a shady place, in sandy soil, under a hand-light; division of the plant in spring; good garden-soil.

- L. anisatus*. 3. Blue. July. 1826. B. R. t. 1282. Syns., *Hyssopus anisatus* and *H. discolor*.
 — *chinensis*. 1-1½. Blue-purple. Siberia and N. China. Syn., *Hyssopus Lophanthus*. Jacq. H. Vind. t. 182.

 — *urticaefolius*. 2. Blue. July. 1826.

Lophi'ola. (A diminutive of *lophos*, a crest; referring to the crested sepals, or flower-leaves. Nat. ord., *Hæmodoraceae*; Tribe, *Conostyleae*. Allied to *Anigozanthus*.)

Hardy herbaceous perennial. Division of the roots in autumn or spring; peaty soil, in a damp, shady situation.

- L. aurea*. 1½. Yellow. June. N. Amer. 1811. B. M. t. 1596.

Lophi'ra. (From *lophos*, a crest; referring to two of the sepals finally expanding into crested wings. Nat. ord., *Dipterocarpeae*.)

This is the Scrubby Oak of Sierra Leone, a handsome tree, with paniced yellow flowers. Endlicher founded the order on it because it is "allied to nothing yet known." A tropical evergreen shrub; cuttings of firm young wood in sand, under a bell-glass, and in a sweet bottom-heat; sandy loam and fibry peat. Summer temp., 60° to 90°; winter, 50° to 60°.

- L. alata*. 10. Yellow. June. Sierra Leone. 1822. Syn., *L. africana*.

Lophole'pis. (From *lophos*, a crest, and *lépis*, a scale. Nat. ord., *Filices—Polypodiaceae*.) A section of **Polypodium**.

Stove ferns. See FERNS.

- L. piloselloides*. ½. W. Indies.

Lophos'ria. (From *lophos*, a crest, and *soros*, a heap; alluding to the sori. Nat. ord., *Filices—Polypodiaceae*.) A synonym of **Alsophila**.

Stove fern. See FERNS.

- L. pruinata*. 8. Tropical America.

Lophosp'ermum. (From *lophos*, a crest, and *sperma*, a seed; the seeds are furnished with a crested wing. Nat. ord., *Scrophulariaceae*; Tribe, *Antirrhineae*.) A synonym of **Maurandia**.

- L. atro-sanguineum*. See *Rhodochiton volubile*.
 — *erubescens*. B. R. t. 1381. See *Maurandia erubescens*.
 — *Rhodochiton*. See *Rhodochiton volubile*.
 — *scandens* of B. M. t. 3037-8 see *Maurandia erubescens*; of B. M. t. 3650 see *Maurandia scandens*.

Lophyrus. One species of this genus, *L. pinii*, causes much damage by its caterpillars feeding on the leaves of young Scotch Firs. The insects appear in the early summer, deposit their eggs in a slit they make in the leaves of the Scotch Fir and cover them with resinous matter. The caterpillars, which are green when young, and rusty brown when fully grown, appear in about three weeks, and attain a length of about an inch. After feeding for a few weeks,

they make their cocoons in the moss or decaying matter beneath the trees. The caterpillars lie doubled up in these cocoons, which are about a quarter of an inch long, and with a very firm exterior, and vary in colour, according to their surroundings. The surest way of destroying this insect is to take advantage of the fact that the cocoons are deposited in the débris beneath the trees, and to collect and burn this. In some cases two broods of flies have been observed in one year, viz., in April and July.

The caterpillars of *Lophyrus rufus* have also been known to damage Scotch Firs. They are greenish, with black heads and yellow-green beneath. The flies appear in August, the females are reddish, the males black, with red beneath.

Lopimia. (From *lopimos*, easily stripped of its bark; alluding to the bark being made into cordage. Nat. ord., *Malvaceæ*.) See **Pavonia**.
L. malacophylla. B. M. t. 4365. See *Pavonia velutina*.

Loquat, or Japan Quince. (*Photinia japonica*.) It ripens its fruit with a moderate amount of heat in this country. Some varieties are said to succeed on the open wall; but it must be in such mild localities as the warmer parts of Devon or Cornwall. The temperature of the peach-house—or what is sometimes called the intermediate-house—will, however, suit it; and as to wintering, it requires little more than the exclusion of frost. As the growth of this, for dessert purposes, has never been, as far as we are aware, systemized in this country, we can only offer a few general hints as to its culture. It has been affirmed that it succeeds best grafted on the quince, and it is very probable; for it belongs to the same natural order, *Rosaceæ*, in addition to which, individuals of the genera *Pyrus*, *Amelanchier*, *Mespilus*, and even the *Photinia serrulata*, being itself an evergreen, present most likely stocks.

Grafting is recommended, in order to check its excessively robust character; for in its natural growth it would be too coarse for ordinary hothouses. Grafting, therefore, or any of the expedients resorted to in pear culture, may be had recourse to. It may be readily propagated from seed, and doubtless by cuttings, and will grow in any ordinary soil. We would, however, use no manurial matters, but simply peat and strong loam, the latter predominating.

Lora'nthus. (From *loron*, a throng; referring to the knotty branches. Nat. ord., *Loranthææ*; Tribe, *Euloranthææ*.)

Evergreen shrubs. For culture, see **NUYTSIA**.
L. flavidus. Yellowish. New Zealand. 1885.
— *floribundus*. See *Nuytsia floribunda*.

Lord Anson's Pea. *Lathyrus magellanicus*.

Lord Harrington's Yew. *Cephalotaxus pedunculata*.

Lords and Ladies. *Arum maculatum*.

Lore'ya. (Named after *M. Lorey*, a botanist, author of the Flora of Burgundy. Nat. ord., *Melastomaceæ*; Tribe, *Miconiææ*. Allied to *Miconia*.)

Stove evergreen tree. Cuttings of young shoots in April, in sand, over sandy peat, and that extra well drained; sandy peat, a little fibry loam, and pieces of charcoal and broken freestone. Summer temp., 60° to 85°; winter, 50° to 55°.

L. arbore'scens. 30. White. July. Guiana. 1822.

Lorinse'ria. (In honour of *Dr. Lorinser*, a German author. Nat. ord., *Filices—Polypodiaceæ*.) A synonym of **Woodwardia**.

Greenhouse fern. See **FERNS**.
L. areolata. 1½. N. America.

Lorope'talum. (From *loron*, a thong, and *petalon*, a petal; in allusion to the long thong-like petals. Nat. ord., *Hamamelidaceæ*. Allied to *Hamamelis*.)

A very ornamental, free-flowering, hardy shrub. Seeds and cuttings. Rich light soil.
L. chinense. 4. White. Autumn. China. 1830. G. C. 1833, xix. p. 152, fig. 23.

Lote. *Zizyphus lotus*.

Lo'tus. Bird's-foot Trefoil. (From the *lotus* of Theophrastus, which is *Zizyphus lotus*. Nat. ord., *Leguminosæ*; Tribe, *Loteæ*. Allied to *Dorycnium*.)

Annuals, by seed at the beginning of April; a very few require the assistance of a gentle hot-bed, and transplanting afterwards; herbaceous and semi-shrubby, low-trailing plants, by division, and cuttings in summer under a handlight, in a shady place. These are very useful for banks and rock-works. Greenhouse and frame kinds, by cuttings of young shoots in sandy soil, under a handlight or frame; light, sandy soil for all.

STOVE ANNUAL.

Lou'rea. (After Prof. Loureiro, of

Lisbon. Nat. ord., *Leguminosæ*; Tribe, *Hedysaræe*.)

Stove herb. Rich sandy loam and peat. Seeds. *L. vespertilionis*. Purplish. Ceylon. Syn., *Hedysarum vespertilionis*. Jacq. Ic. t. 566.

Lourya. (After M. Loury. Nat. ord., *Liliacæ*; Tribe, *Aspidistree*.)

For culture, see ASPIDISTRA.
L. campanulata. Pale yellow. Cochinchina. 1839.
— *paniculata*. Cambodia. 1888. Rev. Hort. 1889, p. 128.

Louse. See **Aphis**.

Lousewort. *Pedicularis*.

Love-apple, or Tomato. *Lycopersicon esculentum*.

Varieties.—Of the *Red*—Conference Early Red, The Peach, Hathaway's Excelsior, Surpasse, Will's Prolific. Of the *Yellow*—Yellow King, Greengage, etc.

Soil.—Rich, light, and on a dry subsoil. Sea-weed may be applied with advantage to the border on which it is grown, as may kelp, or common salt in small quantities. The situation must be sheltered.

Sowing.—Sow at the close of March or early in April in a hotbed or stove. The hotbed must be of a moderate durability, earthed about six inches deep. In a hot-house, sow in pots or boxes set on the flues, or round the edges of the pits.

In whatever situation, sow thin, and not buried more than a quarter of an inch. The plants, when two or three inches high, must be thinned to three inches apart, and those removed pricked at the same distances, in a similar bed to that from which they were removed; shade and water freely in every stage of their growth; for if, from the want of this, a due exposure to the light, or any other cause, they become weak, they seldom are productive. Plant out in the open air early in June; prepare them for this, until at length they can endure the temperature of the greenhouse, where they may be kept until finally moved. But, before that time arrives, another thinning will be requisite; those in the hotbed to six inches apart, and those in the stove, each plant separate into a tolerable-sized pot. They are to be finally planted five feet apart beneath a south paling or wall, to which their branches must be trained; for if allowed to trail on the ground the fruit scarcely ever ripens, and never is in perfection. Water and shade during midday must be afforded until they are established; and if the nights are cold during the first

week or two, the shelter of a hand-glass, or even of a garden-pot, is advantageous.

The training may commence as soon as the branches are a foot long, and continued throughout their growth. In case of a want of space of wall or paling, they may be trained with stakes as espaliers. Throughout the summer clear away all lateral shoots, as well as thin the leaves, so as to expose the fruit to the full influence of the sun.

The berries begin to ripen about the middle of August, and continue to do so until October, or the arrival of the first frosts, which always destroy the plants.

To obtain Seed.—Some of the forwardest berries must be left until perfectly ripe. The seed must be separated from the pulp by washing, as directed for the Cucumber.

Love Grass. *Eragrostis*.

Love-in-a-mist. *Nigella Damascena*.

Love-in-idleness. *Viola tricolor*.

Love-lies-bleeding. *Amaranthus caudatus*.

Love-tree. *Cercis siliquastrum*.

Lowe'a. (Named after Rev. Mr. Lowe, travelling Bachelor of the University of Cambridge. Nat. ord., *Rosaceæ*; Tribe, *Roseæ*.) See **Rosa**.

L. berberidifolia. B. R. t. 1261. See *Rosa berberidifolia*. B. M. t. 7096.

Loxococcus. (From *loxos*, oblique, and *cokkos*, a berry; or oblique fruited. Nat. ord., *Palmeæ*; Tribe, *Areceæ*.)

Stove palm. For cultivation, see ARECA.

L. rupicola. 30-40. Spadix and flowers blood-red. Ceylon. 1878. B. M. t. 6358.

Loxogramma. (From *loxos*, slanting, and *gramma*, writing; referring to the spore or seed-cases. Nat. ord., *Filices*.)

Stove fern. See FERNS.

L. lanceolata. Yellow. May. E. Ind.

Loxosma. (From *loxos*, oblique, and *soma*, a body; the sporangia are obliquely girt by an incomplete ring. Nat. ord., *Filices*—*Polypodiaceæ*.)

Greenhouse evergreen fern. See FERNS.

L. Cunninghamsi. New Zealand.

Lozotenia rosaria is a small moth, of which the caterpillar feeds upon the leaves of the rose-tree. Mr. Curtis says, that "the eggs are laid in the summer or autumn, and hatch with the opening leaves; and the little caterpillar begins at once to form a residence by drawing two or more leaflets together, on which it feeds. This operation soon points out

where the caterpillar is; and the best method which we know of getting rid of it is hand-picking, which should be practised as soon as the operation of the caterpillar becomes visible."

Lubi'nia. (Named after M. St. Lubin, a French botanist. Nat. ord., *Primulaceæ*; Tribe, *Lysimachieæ*.) See **Lysimachia**.

L. a'tro-purpurea. Swt. Fl. Gard. ser. 2, t. 34. See *Lysimachia nutans*.

— *spathulata*. See *Lysimachia lineariloba*.

Luca'nus cervvus. The Stag Beetle is easily distinguished by its highly developed jaws, which bear a certain amount of resemblance to the antlers of a stag. It is the largest of British beetles. The larvæ are found in decaying wood, rarely in healthy trees.

Lucu'lia. (From *luculi swa*, the native name. Nat. ord., *Rubiaceæ*; Tribe, *Cinchoneæ*.)

Greenhouse evergreen fragrant shrubs from India. Cuttings of the young shoots getting a little firm, about Midsummer, in sand, over sandy peat, well-drained, and covered with a bell-glass, set in a close pit or frame, and in a fortnight supplied with a little bottom-heat; peat and loam, both fibry, with sand and pieces of charcoal to keep it open. As soon as established as a little plant, which it will be by the following spring, to be transferred at once to a good large pot; a conservatory-bed, however, is the place where it flourishes and shows off to the best advantage, blooming in the autumn, winter, and spring months. It should also be tried against a conservatory wall.

— *sabicefolia*. 40. Mexico. 1823.

Lu'dia. (From *ludo*, to sport; referring to the various forms of leaf of *L. heterophylla*. Nat. ord., *Bixineæ*; Tribe, *Flacourtiææ*. Allied to *Prockia*.)

Stove evergreen shrubs, with yellow flowers, from Mauritius. Cuttings of half-ripened shoots in sand, under a bell-glass, in bottom-heat; fibry loam, with a little peat, and dried cow-dung. Summer temp., 60° to 85°; winter, 50° to 55°.

L. heterophylla. 4. July. 1823. A synonym of *Aphioia mauritiana*.

— *sessiliflora*. 4. July. 1820. Syn., *L. tuberculata*. Jacq. H. Schoenb. t. 112.

Ludo'via. (In honour of *Louisa*, Queen of Charles IV., of Spain. Nat. ord., *Pandaneæ*.) See **Carludovica**.

L. funifera. See *Carludovica funifera*.
— lanceafolia. Fl. Ser. t. 1515-6. See *Carludovica lanceafolia*.
— latifolia. B. M. t. 2950-1. See *Carludovica latifolia*.

Lueddema'nnia. (After Herr *Lueddemann*. Nat. ord., *Orchidææ*; Tribe, *Vandææ—Cyrtopodiææ*.)

At the time of the publication of the *Genera Plantarum* this genus was imperfectly known, and in that work was referred to *CYCNOCHES*. Better material having since been obtained, its claim to rank as a distinct genus has been established.

Stove orchids. For culture, see *CYCNOCHES*.

L. Lehmanni. See *Cycnoches Lehmanni*.
— Pescatorei. 3. Yellow, reddish. July. New Grenada. 1848. B. M. t. 7123. Scent of decaying oranges. Syn., *Cycnoches Pescatorei*. Paxt. Fl. Gard. i. p. 123, and *Acineta glauca*.

Luhe'a. (Named after *Luhe*, a German botanist. Nat. ord., *Tiliacææ*. Allied to *Sparmannia*.)

Stove evergreens. Cuttings of half-ripened shoots, two inches in length, in sand, under a bell-glass, and plunged in bottom-heat; fibry peat and sandy loam. Summer temp., 60° to 80°; winter, 48° to 55°.

L. caracasana. Caracas. 1847. Shrub.
— paniculata. 10. Rosy. April. Brazil. 1828. Climber.

Lui'sia. (Name not explained. Nat. ord., *Orchidææ*; Tribe, *Vandææ—Sarcantheææ*. Allied to *Vanda*.)

Stove orchid. Detaching the side-shoots. Grow on a block of wood covered with moss, or elevated above a pot, with sphagnum, peat, crocks, etc. Temperature, 60° to 90°, when growing in summer with a moist atmosphere; 50° to 60° in winter, and dry; 60° to 90° in spring, and rather dry, to start the flower-buds, kept cooler afterwards, and excited again when the flowering is over.

L. alpina. See *Vanda alpina*.
— macratia. Yellowish-green, violet. Assam. 1869.
— microptera. Straw-yellow, purple. Assam. 1870.
— platygloussa. See *L. teretifolia*.
— Psyche. Green, purple. Burmah. 1865. B. M. t. 5553.
— teretifolia. Dull purple, white. Khasia. Syn., *L. platyglossa*, *L. trichorhiza*, and *Cymbidium triste*. B. M. t. 3648.

Lu'ma. See *Myrtus*.

Lumnitzera of Jacquin. (Named after *Lumnitzer*, a botanical author. Nat. ord., *Labiataææ*.) See **Ocimum**.

This must not be confounded with a *Combretaceæ* genus (not in cultivation), which is kept up.

L. tenuiflora. See *Ocimum sanctum*.

Luna'ria. Moonwort or Honesty. (From *luna*, the moon; referring to the shape of the seed-vessels. Nat. ord., *Cruciferaææ*; Tribe, *Alyssinææ*. Allied to *Alyssum*.)

Hardy plants, natives of Europe and W. Asia, and flowering in May; seeds and divisions in spring. Common garden-soil.

L. annua. 4. Light purple. 1570. Biennial. Syn., *L. biennis*. Rev. Hort. 1867, p. 30.
— albiflora. 3. White. 1570.
— redivi'na. 3. Light purple. 1596. Herbaceous perennial.

Lungwort. *Pulmona'ria*.

Lupina'ster. See **Trifolium**.

L. oblongifolius. See *Trifolium Lupinaster*, var. *purpurascens*.
— pentaphyllus. See *Trifolium Lupinaster*.

Lupine. *Lupi'nus*.

Lupi'nus. Lupine. (From *lupus*, a wolf; devastates land as the wolf does the fold; literally, destroyer. Nat. ord., *Leguminosææ*; Tribe, *Genisteææ*.)

They are generally arranged into annuals, perennials, and frame evergreen shrubs; but they all produce seed so freely, that it is easiest to propagate them by that means, only the evergreens, instead of being sown in the open ground, should have the assistance of a gentle hotbed to rear them before planting them out. If such kinds as *mutabilis* and *Cruikshankii* are sown in August, and kept in pots all the winter in a pit, they make splendid specimens on a lawn the following summer.

Luvunga, its Sanskrit name, is a genus founded on *Limonia scandens*, and contains no other species.

Luxemburgia. (Named after the Duke of Luxembourg. Nat. ord., *Ochnaceae*; Tribe, *Luxemburgiæ*.)

Stove evergreen shrubs, yellow-flowered, from Brazil. Cuttings of half-ripened shoots in sand, under a bell-glass, and in a gentle bottom-heat; peat and loam. Summer temp., 60° to 75°; winter, 48° to 55°. They require a constant liberal supply of moisture.

- L. citiboa*. 4. June. 1841. Ic. Pl. t. 516.
 — *corymbosa*. 5. May.

Luzuriaga. (Dedicated to Ignatia Maria Ruiz de Luzuriaga, a Professor of Medicine and Botany. Nat. ord., *Liliaceae*; Tribe, *Luzuriageae*. Syn., *Callixene*.)

Ornamental evergreen climbing greenhouse shrubs, suitable for covering the walls of greenhouses, etc. For cultivation, see PHILEA.

- L. erecta*. 1-1½. Pure white. South Chili. Syn., *Callixene polyphylla*. B. M. t. 5192.

— *marginalis*. White, scented like heliotrope. Terra del Fuego. Syn., *Callixene marginalis*.

- *radicans*. 3. White. Summer. 1878. B. M. t. 6465. The stems are used for rope-making. May be planted out in the south of England.

Lycaeste. (Named after the beautiful daughter of Priam. Nat. ord., *Orchidaceae*; Tribe, *Vandee*—*Cyrtopodieae*. Allied to *Maxillaria*. Syns., *Colax* and *Paphinia*.)

Stove orchids. Division of the plant, as growth is commencing; open baskets, in sphagnum, fibry peat, and pieces of charcoal. Summer temp., 60° to 90°; winter, 50° to 60°.

- L. aromatica*. Orange. May. Mexico. 1828. Syn., *Maxillaria aromatica*. B. R. t. 1871.

- *retusa*. 1. Yellow. May. Brazil.
 — *Barringtoniae*. Yellow, brown. April. Jamaica. 1790. Syn., *Maxillaria citata*. B. R. t. 1206.

- *sulphu'rea*. Sulphur, red, purple. 1832.
- *tetra'gona*. ½. Greenish. Brazil. 1842. Syn., *Maillaria tetragona*. B. M. t. 3146.
- *tricolor*. Pink. April. Guatemala. 1852.
- *tyrianthi'na*. Bright violet. July. Brazil. 1836.
- *Wittgii*. White, purple, violet, brown. Rio Janeiro. 1878.

L. xytrio'phora. Brown, yellowish, purplish. Ecuador. 1868.

Lychnis. (From *lychnos*, a lamp; referring to the brilliancy of the flowers. Nat. ord., *Caryophyllaceæ*; Tribe, *Sileneæ*. Syns., *Agrostemma*, *Eudianthe Githago*, and *Viscaria*.)

The hardy herbaceous species are chiefly cultivated; seeds, divisions, and cuttings of the young shoots under a hand-light as growth commences, in spring. Small side-shoots may be obtained from flowering stems, but they do not answer so well; rich, sandy loam. They require dividing often in spring, and fresh soil to grow in. *Grandiflora* requires protection in a cold pit in winter; double flowers require more attention in changing the soil than single ones.

TENDER KINDS.

- L. corona'ta*. 1½. Red. July. China. 1770. Greenhouse herbaceous. B. C. t. 1433. Syn., *L. grandiflora*, Jacq. Ic. t. 84.

Lyciople'sium. (From *Lycium*, and *plesios*, near to; resembling *Lycium*. Nat. ord., *Solanaceæ*; Tribe, *Solanecæ*.)
A synonym of **Acnistus**.

L. pubisto'rum. B. M. t. 5373. See *Latua venenosa*.

Lycium. Box Thorn. (From *Lycium*, an ancient name of a district in Asia Minor. Nat. ord., *Solanaceæ*; Tribe, *Atropceæ*. Allied to *Mandragora*.)

Cuttings of ripened shoots in autumn or spring, under a hand-light; common, sandy loam. The tender kinds require protection. They are mostly of a free, rambling, half-climbing character; and *vulga're* and its congeners are thus well-fitted for covering arbours, unsightly walls, etc.; *a'frum* does well on a conservatory wall, and its fruit is pretty, and it blooms very freely.

EVERGREENS.

L. carolinia'num. 4. Blue. July. Carolina. 1806. Hardy shrub.
— *cin'e'reum*. 5. Violet. June. Cape of Good Hope. 1818. Greenhouse shrub.
— *ho'rridum*. 3. White. July. Cape of Good Hope. 1791. Greenhouse shrub.
— *te'nu'e*. 4. Violet. June. Cape of Good Hope. 1819. Greenhouse shrub.

— *sphaeroca'rpum*. 12. May.

Lycocom'rium. (Derivation uncertain. Nat. ord., *Orchideæ*; Tribe, *Vandææ*—*Cyrtopodiææ*.)

Stove orchids. For culture, see PERISTERIA.
L. ceri'num. 1. Yellow. June. Central America. 1835. Syn., *Peristeria cerina*, B. R. t. 1953.
— *gutta'ta*. $\frac{1}{2}$. Yellow, purple. August. South

America. 1837. Syn., *Peristeria guttata*, Kn. and West. t. 70.

Lycop'e'rdon. A genus of fungi of the order *Gasteromycetes*, popularly known as Puff-balls, on account of the manner in which the spores are discharged, when ripe. *L. giga'ntium* is edible before the spores are formed, while the interior is still white and fleshy, and is much esteemed by some. It sometimes attains a diameter of two feet.

Lycop'e'sicum. Love-apple, or Tomato. (From *lykos*, a wolf, and *persicon*, a peach. Nat. ord., *Solanaceæ*.)
See **Love-apple**.

All annuals, except *peruvia'num*, and natives of South America. Seeds in a hotbed in March, potted once or twice, and planted out in May; *escule'ntum* generally against walls or palings, in order that the fruit may be ripened for sauce and soups; rich soil; the plant must be well thinned and stopped above the fruit. To have the fruit is the object.

L. cerasi'forme. 3. Green. July. 1800. Syn., *Solanum pseudo-lycopersicum*, Jacq. Vind. t. 11.
— *tu'teum*. 3. Green. July. 1596.
— *commuta'tum*. See *L. peruvia'num*.
— *escule'ntum*. 3. Green. July. 1596. Gfl. 1886, p. 216.
— *chrysoca'rpum*. 3. Green. July. 1596.
— *erythroca'rpum*. 3. Green. July. 1596.
— *leucoca'rpum*. 3. Green. July. 1596.
— *Humbo'ldtii*. 3. Yellow. August. 1822.
— *peruvia'num*. 3. Yellow. May. 1823. Stove herbaceous. Syns., *L. commuta'tum* and *Solanum peruvia'num*, Jacq. Ic. t. 327.
— *proci'mbens*. 1. Cream. July. 1700.
— *pyri'forme*. 3. Yellow. August. 1823.

Lycopo'dium. Club Moss. (From *lykos*, a wolf, and *pos*, a foot; the roots having a resemblance to that animal's paw. Nat. ord., *Lycopodiææ*.)

These flourish best in a greenhouse or cool fernery. They may be grown in pots, but do best as a carpet over the surface of the beds or borders. They are easily propagated by cuttings in the spring. *L. apo'dium*, *apoth'e'cium*, *circina'tum*, *corda'tum*, *ca'sium*, *denticula'tum*, *lepidophy'llum*, *stoloni'ferum*, and *umbro'sum* may be propagated by division at the same season. They require a plentiful supply of moisture, and a turfy loam for their soil, though they will grow in any light loam. *L. ca'sium* and *helveticum* turn brown if exposed to much light.

L. alois'o'lium. E. Indies. Hook. Ic. Fil. t. 223.
— *alpi'num*. $\frac{1}{2}$. Britain.
— *annoti'num*. $\frac{1}{2}$. Britain.

 - *varium*. 1. Tasmania.
 - *volubile*. 6. New Zealand.
 - *Willdenovii*.

Lycopsis. (Derivation uncertain. Nat. ord., *Boraginaceæ*.)

Hardy annual. For culture, see ANCHUSA.

- L. orientalis*. 2. Blue. July. South Europe. 1821. Syn., *Anchusa verrucosa*.

Lycoris. (The name of a woman in Roman history. Nat. ord., *Amaryllidaceæ*; Tribe, *Amaryllidaceæ*. Allied to *Valotta*.)

Hardy bulbs, from China. *Aurea* is a pretty bulb, with greyish leaves, requiring a deep, sandy-soiled border; but, as it grows all the winter, it is best kept in a pot. *Radiata* is a shy bloomer. For culture, see AMARYLLIS.

- L. aurea*. 1. Yellow. August. 1777. Syn., *Amaryllis aurea*. B. M. t. 409.
- *radiata*. 1½. Pink. June. 1768. Syn., *Amaryllis radiata*. Andr. Rep. t. 25.
- *variegata*. See *L. Terracianii*.

Lyonia. (Named by Nuttall, after *J. Lyon*, an American collector of plants. Nat. ord., *Ericaceæ*; Tribe, *Andromedaceæ*. Allied to *Andromeda*.)

Hardy white-flowered evergreens, from North America. Chiefly by layers, in a damp, peat border; also by seeds in sandy peat, best under hand-lights, and sparingly covered; sandy peat, and cool situation. Several species of *Andromeda* have been moved to this genus.

- L. capreaefolia*. Wats. Dendr. t. 127. See *L. ligustrina*, var. *capreaefolia*.
- *fasciculata*. White. Jamaica. Syn., *Andromeda fasciculata*.

- *salicifolia*. See *L. ligustrina*, var. *salicifolia*.

Lyonisia. (Named after *J. Lyons*, who first taught botany to Sir Joseph Banks. Nat. ord., *Apocynaceæ*; Tribe, *Echitidaceæ*. Allied to *Parsonsia*.)

Greenhouse evergreen twiner. Cuttings of the young shoots in sand, under a glass, and in a close frame, in April; sandy peat, with a little fibry loam. Winter temp., 40° to 48°.

- L. straminea*. 6. Striped. June. New South Wales. 1820.

Lyperia. (From *lyperos*, sad; from the dulness of some of the flowers. Nat. ord., *Scrophulariaceæ*; Tribe, *Manuleæ*. Allied to *Manulea*.)

Greenhouse evergreens, from South Africa. By seed in a slight hotbed, in March and April, and cuttings of young shoots in spring and autumn, in sandy soil, under a hand-glass; sandy loam; the protection of a cold pit or greenhouse in winter.

- L. argentea*. 1½. White. August. 1801. Annual.
- *fragrans*. ½. White, purple. June. 1776. Syn., *Erinus fragrans*.
- *pedunculata*. 1½. White. August. 1790. Syn., *Buchnera pedunculata*. Andr. Rep. t. 84.
- *pinnatifida*. ¾. Purple. July. 1840.
- *tristis*. 1. Purple. May. 1825. Syn., *Erinus tristis*.
- *violacea*. 2. Violet. July. 1816.

Lysimachia. Loosetrife. (From *lysis*, concluding, and *mache*, strife;

supposed to possess soothing qualities. Nat. ord., *Primulaceæ*.)

All yellow-flowered, except where otherwise mentioned. Division in spring, and cuttings of the young shoots under a hand-light, in sandy loam, in a shady corner. There are a few annuals and biennials not worth culture.

GREENHOUSE.

- L. atro-purpurea*. 1. Dark purple. August. Levant. 1820. Herbaceous. Sibth. Fl. Gr. t. 187. Syn., *L. dubia*.

Lysine'ma. (From *lysis*, freeing, and *nema*, a filament. The stamens not adhering to the sides of the corolla, as is usual in this. Nat. ord., *Epacridæ*; Tribe, *Epacreae*. Allied to *Epacris*.)

Greenhouse evergreen shrubs, from Australia. Cuttings of the young shoots, getting firm at the base,—short shoots, a couple of inches in length, are the best,—in sand, under a bell-glass, in the beginning of summer; rough, sandy peat, with pieces of charcoal, broken bricks, and freestone, and well-drained. Winter temp., 40° to 45°.

- L. attenuatum*. See *L. pungens*.
— *ciliatum*. 2. Pink. March. 1823. Syn., *L. pentapetalum*.
— *conspicuum*. 3. March. 1824.
— *lasianthum*. 2. Pink. March. 1820.
— *pentapetalum*. See *L. ciliatum*.

— *rubrum*. 2. Red. March. 1804. Syn., *Epacris rosea*, B. C. t. 863.

Lysionotus. (From *lysis*, freeing, and *notos*, the back; seed-vessel opening from the back. Nat. ord., *Gesneraceæ*; Tribe, *Cyrtandreae*. Allied to *Agalmyla*.)

Stove herbaceous. Seeds in light, sandy soil, in a hotbed, in spring; division of the plant at the same time; peat and loam. Summer temp., 60° to 75°; winter, 45° to 50°.

- L. longiflora*. A synonym of *Echynanthus longiflorus*.
— *serrata*. 1. Pale lilac, or blue with darker veins. July to August. Temperate and Sub-tropical Himalayas. B. M. t. 6538. Syn., *L. ternifolia*.
— *ternifolia*. Gf. t. 1216. See *L. serrata*.

Lysistigma. (From *lysis*, a dissolution, and *stigma*, the stigma; stigmas separated. Nat. ord., *Araceæ*; Tribe, *Dieffenbachieæ*.) United with *Tacca-rum* in the Genera Plantarum, but retained as distinct by Engler.

Stove tuberous perennial. Allied to *Staurostigma*, which see for cultivation.

- L. peregrinum*. 3. Spathe olive-green. Java. Syn., *Endera conophalloidea* and *Conophallus Blumei*.

Lythrum. (From *lythron*, black-blood; the prevailing purple colour of the flowers. Nat. ord., *Lythraceæ*; Tribe, *Lythreae*.)

All purple-flowered, except *lineare*. Seeds of annuals, in the common border, in spring; perennials, by division at the same time. *Alatum* is an old resident of the greenhouse, but is perfectly hardy, and may be propagated by division and cuttings of the young shoots, or the points of old ones. The following are all hardy herbaceous, except *Græferi*, which is an evergreen trailer and not quite hardy.

- L. alatum*. 3. July. Georgia and Mexico. 1812. B. M. t. 1812. Syn., *L. Kennedyanum* and *L. vulneraria*.
— *diffusum*. Swt. Fl. Gard., t. 149. See *L. lanceolatum*.

M.

Maa'ckia amurensis. B. M. t. 6551. See *Cladrastris amurensis*.

Ma'ba. (From the native name.)

Nat. ord., *Ebenaceæ*. Allied to *Diospyros*.)

Stove evergreen shrubs. Cuttings of half-ripened shoots in May, under a glass in sand, over fibry peat, and a very slight bottom-heat; peat and loam.

M. buxifolia. 1½. Yellow. Tropical India, Africa and Australia. 1810. Stove.
— *laurina*. 3. July. Cumberland Island, Australia. 1824.

Macada'mia. (Named after *John Macadam*, M.D., Secretary of the Philosophical Institute of Victoria. Nat. ord., *Proteaceæ*; Tribe, *Grevilleæ*. Allied to *Roupala*.)

Greenhouse evergreen tree, yielding an edible nut of good flavour. For cultivation, see *HAKKA*.
M. ternstroemia. 30. Moreton Bay. 1869. G. C. 1870, p. 1181.

Macara'nga. (From the Malagasy name of this plant. Nat. ord., *Euphorbiaceæ*.)

Stove tree.

M. Porteana. Leaves 1½ feet long; petioles 2 feet; under surface with black dots. Philippines. 1888. Rev. Hort. 1888, p. 176, fig. 36. Syn., *Mappa Porteana*.

Macbridea. (Named after *Dr. Macbride*, of S. Carolina. Nat. ord., *Labiatae*; Tribe, *Stachydeæ*. Allied to *Melittis*.)

Greenhouse evergreen. Cuttings of young shoots, getting firm at their base, in May; loam and a little sandy peat, well-drained.

M. pulchra. Red-striped. July. Carolina. 1804. Syn., *M. pulchella*.

Machæra'nthera. (From *makaira*, a bent sword, and *anthera*, an anther; alluding to the shape of that part of the flower. Nat. ord., *Compositæ*; Tribe, *Asteroideæ*.) See *Aster*.

M. tanacetifolia. B. M. t. 4624. See *Aster tanacetifolius*.

Macka'ya. (In honour of *Dr. J. F. Mackay*, once Keeper of Dublin University Botanic Garden, and author of "The Flora Hibernica." Nat. ord., *Acanthaceæ*; Tribe, *Justiceæ*.)

Greenhouse shrub, exceedingly handsome, with racemes of large, delicate, lilac-tinted flowers, transversely marked with red lines. Seeds; cuttings of half-ripened wood under hand-glass. Light sandy loam. Summer temp., 70° to 80°; winter, 50° to 60°.

M. bella. White, with red lines. May. Natal. 1869. B. M. t. 5797. Syn., *Asystasia bella*.

Maclea'nia. (Named after *John Maclean*, Esq., of Lima, a British merchant, and a distinguished patron of botany. Nat. ord., *Vacciniaceæ*; Tribe, *Thibaudieæ*. Allied to *Thibaudia*.)

Greenhouse evergreens. Cuttings under a hand-light or bell-glass of the points of the shoots, when getting firm at their base, in sand, and kept close in a cold pit, a little air left under the glass, if placed in a slight hotbed;

sandy loam and fibry peat. Winter temp., 40° to 48°.

M. angulata. 3. Red, yellow. June. Peru. 1842.

— *coccinea*. 3. Scarlet, tipped with yellow. Rev. Hort. 1851, p. 301.

— *cordata*. Orange. Mexico. 1848. Syn., *Gaultheria cordata*.

— *longiflora*. 5. Red. May. Peru. 1844. B. R. 1844, t. 25. Syn., *M. tenuifolia*.

— *pulchra*. Scarlet, yellow. New Grenada. 1874. Stove shrubs.

— *punctata*. Red, yellow. November. Ecuador. 1848.

— *speciosissima*. Scarlet, yellow. Columbia. 1864. Stove shrub.

— *tenuifolia*. See *M. longiflora*.

Maclea'ya. (Named after *A. Macleay*, a British naturalist. Nat. ord., *Papaveraceæ*.) See *Bocconia*.

M. cordata. B. M. t. 1905, and *M. yedoensis*. See *Bocconia cordata*.

Maclura. (Named after *W. Maclure*, a North American geologist. Nat. ord., *Urticaceæ*; Tribe, *Moreæ*. Allied to *Broussonetia*.)

Cuttings of ripe shoots under a glass, in heat; *aurantiaca* by cuttings of the root and layers; soil, peat and loam. Although *aurantiaca* is hardy, it requires a warm situation.

M. aurantiaca. 20. N. Amer. 1818. Hardy deciduous. Osage Orange.

— *Plumieri*. See *Chlorophora tinctoria*, var. *Plumieri*.

— *tinctoria*. See *Chlorophora tinctoria*.

— *tricuspidata*. China. 1872. A good hedge plant. Rev. Hort. 1872, p. 56. This is a synonym of *Audrania tricuspidata*.

Maco'des. (Not explained. Nat. ord., *Orchideæ*; Tribe, *Neottieæ-Spirantheæ*.)

Terrestrial stove orchid. See *ORCHIDS*.

M. javanica. 1-1½. Orange-red, midrib white; lip pale yellow. Leaves deep velvety green, with light green nerves and transverse marks. May. Java. 1888. B. M. t. 7037.

— *Petola*. Java. 1859. Rchb. Xen. i. t. 96, figs. 1-5. *Marmorata* (Rchb. Xen. i. t. 96, figs. 6-10) is a slight variety.

Macrade'nia. (From *makros*, long, and *aden*, a gland; referring to the long process of the pollen-masses. Nat. ord., *Orchideæ*; Tribe, *Vandee-Notylieæ*. Allied to *Notylia*.)

Stove orchid. Division when growth is commencing; fibry peat, charcoal, and broken pots and sphagnum; the plants raised above the pot requiring a strong, moist heat in the orchid-house when growth is proceeding, and cooler and drier when resting.

M. brassavolce. Brown, ochre, yellow, purple. Columbia. 1864.

— *lutescens*. ½. Olive. November. Trinidad. 1821. B. R. t. 612.

— *trianstrali*. Greenish outside, red inside. May. Cuba. B. R. t. 1815.

Macræ'a. (After *Mr. Macræ*. Nat. ord., *Geraniaceæ*.) A synonym of *Viviana*.

Macra'nthus. (From *makros*, long, and *anthos*, a flower. Nat. ord., *Legu-*

minosæ; Tribe, *Phaseoleæ*.) See *Mucuna*.

M. cochinchinensis. See *Mucuna cochinchinensis*.

Macrochilus. (From *makros*, long, and *cheilos*, a lip. Nat. ord., *Orchidææ*; Tribe, *Vandææ-Oncidiææ*.) See *Miltonia*.

M. Frya'nus. Kn. and West. t. 45. See *Miltonia spectabilis*.

Macrocne'mum. (From *makros*, long, and *kneme*, a leg; referring to the flower-stalks. Nat. ord., *Rubiaceæ*; Tribe, *Cinchonææ*. Allied to *Portlandia*.)

Stove evergreen trees. Cuttings of ripe shoots in sand, under a bell-glass, and in a brisk bottom-heat; peat and fibry loam, well drained. Winter temp., 55° to 60°; summer, 60° to 85°.

M. cocci'neum. See *Warszewiczia coccinea*: — *jamaicæ nse*. 14. White. Jamaica. 1806. — *tinctorium*. See *Condaminia tinctoria*.

Macromeria. (From *makros*, long, and *meris*, a part; referring to the unusual length of the stamens. Nat. ord., *Boraginææ*; Tribe, *Boragææ*.)

Half-hardy evergreen shrub, requiring the protection of a cold pit in winter; seeds and divisions in spring; sandy loam and fibry peat.

M. ezser'ta. 3. Yellow. September. Mexico. 1846. B. R. 1847, t. 26.

Macrochordium. See *Æchmea*.

Macropiper. See *Piper*.

Macropodia. (From *makros*, long, and *pous*, a foot. Nat. ord., *Hæmodoracææ*.)

Cool greenhouse herb. Loam one part, peat three parts. Division of roots in spring.

M. fuliginosa. 3. Yellow. June. Australia. Syn., *Anigozanthus fuliginosa*.

Macroscepis. (From *makros*, long, and *skepe*, a covering. Nat. ord., *Asclepiadææ*; Tribe, *Cynanchææ*.)

Stove twining shrub.

M. obovata. Yellow-brown. November. Tropical America from Mexico to Peru. B. M. t. 6815.

Macrosphyra. (From *makros*, long, and *sphura*, a hammer; the style is very long and bears a large terminal stigma. Nat. ord., *Rubiaceæ*; Tribe, *Gardeniææ*.)

Stove evergreen shrub. For culture, see *GARDENIA*.

M. longistyla. 6. Green, white. June. W. Africa. 1845. Syn., *Gardenia longistyla*. B. M. t. 4322.

Macrostigma tupistroides. See *Tupistra macrostigma*.

Macrostylis. (From *makros*, long, and *stylis*, a style, or female organ. Nat. ord., *Rutacææ*; Tribe, *Diosmeææ*. Allied to *Agathosma*.)

Greenhouse evergreen shrubs, from the Cape of Good Hope. Cuttings of young shoots getting firm, in April or May, in sand, under a bell-glass, and kept in a close place, but without bottom-heat; sandy peat and fibry loam, but most of the former. Winter temp., 40° to 48°.

M. barbat'a. 2. White. May. 1816.

— *barb'gera*. Lilac. April. 1826.

— *squarro'sa*. Lilac. April. 1821.

Macroto'mia. (Derivation uncertain. Nat. ord., *Borginææ*.)

Greenhouse or half-hardy perennial.

M. Benth'ni. 1-3. Brownish-purple. N. W. Himalayas. 1888. B. M. t. 7003.

Macrotr'pis. (From *makros*, long, and *tropis*, a keel; referring to the length and name of the lower part of a pea-flower. Nat. ord., *Leguminosææ*; Tribe, *Sophorææ*. Allied to *Sophora*.) United with *Ormosia* in the *Genera Plantarum*.

Greenhouse evergreen shrubs, from China. Cuttings of small side-shoots, taken off in spring, in sand, under a bell-glass; seeds sown in a slight hotbed, and potted off when up; peat and loam, in equal divisions. Winter temp., 40° to 48°.

M. fo'etida. 6. Yellow. April. 1820.

— *inodo'ra*. White. April. 1821.

Macroza'mia. (From *makros*, long, and *Zamia*. Nat. ord., *Cycadacææ*; Tribe, *Encephalar'teææ*.)

Greenhouse evergreen perennials. For cultivation, see *ZAMIA*.

M. caloco'ma. See *Microcycas calocoma*.

— *tomentosa.* See *M. macrophylla*.

Magno'lia. (Named after Professor Magnol, of Montpellier. Nat. ord., *Magnoliaceæ*; Tribe, *Magnoliææ*.)

A noble genus, all white-flowered, except where otherwise mentioned. Propagated by seeds, layers, grafting, and budding; and each of these modes best suits different kinds. Seeds of most of the American kinds are easily procured thence, and from France, where, in their clearer sky, the trees thrive better, and ripen their seeds, which they seldom do with us. The seeds should be sown in a hotbed, in spring, and a little patience should be exercised until the seedlings make their appearance, when they must be successively potted, and kept several years in a cold pit in winter. Though the most vigorous plants are thus raised, yet, as they are long in blooming, preference is usually given to plants raised from layers of all the stronger-growing kinds. These are generally laid down in the autumn, and the best part of two years generally elapses before they are fit to be moved, when they should be potted, and kept in a pit until well established. No one should purchase a young plant, except in a pot, as the few, but large, fleshy roots are easily injured. Some of the more succulent-stemmed kinds, with large pith, can neither be easily layered nor grafted—such as *tripe'tala* and *macrophylla*. For these

seedlings are the best, and the seed ripens freely in different parts of France. Most of the varieties and the weaker species may be budded, and grafted, and inarched on the stronger-growing, more easily-reared kinds. *Obovata* and *acuminata* are much used for this purpose. In most cases it requires a considerable time to effect the union. In many cases, where inarching is resorted to, two years must elapse before the separation can be effected safely. The tenderer Chinese and Asiatic species require, in general, protection in winter; the former a cold pit or greenhouse, the latter a wall, etc. They are propagated by layers, and also by cuttings, as well as seeds. The cuttings should be of ripe shoots, and inserted in sand, under a glass. Many kinds, however, will propagate by the herbaceous-like young shoots; but more attention to shading, etc., is required. All delight, when planted out, in a deep, sandy soil, quite dry, and enriched with peat and a little leaf-mould. *Glauca*, however, generally thrives best in a peaty soil rather retentive of moisture.

See *Onosma emodi*.

Mahe'rnica. (An anagram of *Hermannia*, an allied genus. Nat. ord., *Sterculiaceæ*; Tribe, *Hermanniceæ*.)

Greenhouse evergreen shrubs, about two feet high, from South Africa. Cuttings of young shoots, an inch or two in length, in sandy soil, under a glass any time in summer; fibry loam and sandy peat, with lumps of charcoal and broken pots, intermixed when grown in pots. In summer they will do in the flower-garden, and did the flowers look up a little more, they would be very interesting; from their habit they are seen to best advantage in a pot.

Mahurea. (The native name.)

Nat. ord., *Ternstroemiaceæ*; Tribe, *Bonneticeæ*. Allied to *Stuartia*.)

Stove evergreen tree. Cuttings of half-ripened shoots in sand, under a bell-glass, and in a moderate bottom-heat, any time in summer; sandy peat and fibry loam. Winter temp., 50° to 60°; summer, 60° to 80°.

M. palustris. 15. Purple. May. Guiana. 1820. Syn., *Bonnetia palustris*.

Maiden-Hair. *Passiflora adiantum*, and *Adiantum capillus Venereis*, etc.

Maiden-Hair-tree. *Gingko biloba*.

Maiden Plum. *Comocladia*.

Maiden Tree is a seedling tree which has not been grafted.

The time which elapses before seedlings attain a bearing age is very various. The pear requires from twelve to eighteen years; the apple, five to thirteen; plum and cherry, four to five; vine, three to four; raspberry, two; and the strawberry, one.

Maianthemum. (From *maios*, May, and *antheon*, a flower. Nat. ord., *Liliaceæ*.)

Hardy bulb. Culture as for *SMILACINA*.
M. biflorum. † White. May. Britain. Syns., *Convallaria bifolia*, B. M. t. 610, *Smilacina bifolia* and *S. canadensis*.

Maieta. (The native name. Nat. ord., *Melastomaceæ*; Tribe, *Miconiceæ*. Allied to *Clidemia*.)

Stove evergreen shrub. Cuttings of young shoots, getting a little firm, in sandy soil, and in bottom-heat, in April and May; peat and loam, with a little charcoal and brick-rubbish. Winter temp., 50° to 60°; summer, 60° to 80°.

M. guianensis. 2. White. Guiana. 1824.

Mai'ria. (Derivation not explained. Nat. ord., *Compositæ*; Tribe, *Asteroideæ*. Allied to *Aster*.)

Half-hardy herbaceous plants, from South Africa; seeds, and divisions in spring; requiring the protection of a dry, cold pit in winter; sandy loam and a little peat.

M. crenata. Lilac. April. 1820. Syns, *Arnica crenata*, B. C. t. 901, and *Gerbera crenata*, B. R. t. 855.
— *taxifolia*. Yellow. July. 1816.

Majorana. See *Origanum*.

Malabai'na. (After Count Malabaila von Canal, of Prague. Nat. ord., *Umbelliferae*. Syn., *Leiotulus*.)

Hardy perennial herbs. Seeds in open ground, in spring.

M. Opoponax. 6. Yellow. June. South Europe. 1640. Syns., *Opoponax Chironium* and *Pastinaca Opoponax*.
— *pimpinellofolia*. 2. Yellow. July. Caucasus. 1813.

Malabar Leaf. *Cinnamomum Malabathrum*.

Malabar Nightshade. *Basella*.

Malabar Rose. *Hibi'scus ro'sa malaba'rica.*

Malachade'nia. (Nat. ord., *Orchideæ.*) A synonym of **Bulbophyllum.** *M. clava'ta.* Green, spotted with brown. Rio Janeiro. 1839. B. M. t. 4334.

Malochode'ndron. See **Stuar-tia.**

Mala'xis. (From *malaxis*, delicate; referring to the whole plant. Nat. ord., *Orchideæ*; Tribe, *Epidendrea-Malaxææ.* Allied to *Calypso.*)

Terrestrial orchids, growing in sandy peat, and in moist places; division of the roots.

M. cauda'ta. See *Brassia caudata.*
— *lilifo'lia.* B. M. t. 2004. See *Liparis lilifolia.*

— *taraxacifo'lia.* 4. Purple. Siberia. 1795.

Male Fern. *Aspi'dium filix-ma's.*

Maleshe'rbia. (Named after a French patron of botany. Nat. ord., *Passiflorææ*; Tribe, *Malesherbiææ.*)

Greenhouse annuals, from Chili. Seeds sown in a hotbed, in March, seedlings pricked off, potted, and flowered in the greenhouse; sandy peat and fibry loam, with a little very reduced leaf-mould.

M. corona'ta and *fascicula'ta* are synonyms of *Gynopleura linearifolia.*

— *hu'milis.* †. White. 1831.

— *linearifo'lia.* 1†. Purple, blue. September. 1831. B. M. t. 3362. Now known as *Gynopleura linearifolia.*

— *thyrso'ra.* Yellow. July. 1832.

Mallo'tus. (From *mallotos*, hairy; because of the hairy fruit. Nat. ord., *Euphorbiææ*; Tribe, *Crotonææ.*)

A large genus of trees and shrubs, nearly all tropical, though the only one yet introduced will probably prove nearly or quite hardy in the south of England. Seeds; ripened cuttings, in sandy loam, under a bell-glass.

M. japonica. Japan. 1866.

Mallow. *Mal'va.*

Mallow Rose. *Hibi'scus moscheu'los.*

Mal'lope. (From *malos*, soft, or tender; referring to the texture of the leaves. Nat. ord., *Malvaceæ*; Tribe, *Malvææ.*)

Hardy annuals, with purple flowers, from Barbary. Seeds sown under a glass, in March, or in the open border towards the end of April; earlier, if the ground is sandy and early.

M. malacot'des. 1. June. 1710. B. M. t. 5852.

Mame'stra. The larva of the Bright-line-brown-eye, or Pot-herb Moth (*Mame'stra olera'cea*), may be found early in December, beneath the surface of the earth, undergoing its transformations. This caterpillar is one of the most destructive of our garden enemies, feeding on the stem, just under the surface, of cabbages, but more especially brocoli, lettuces, and some other garden produce during the autumn. It is of a livid yellowish-brown colour, darkly striped on the back and sides, and with a white stripe nearly over the feet, which are light brown. It has black dots between the dark stripes. When young, and sometimes even when fully grown, it has a green ground colour. The moth comes forth in the summer. It measures one and a half inches across the fore-wings, which are nearly of a uniform chestnut colour, but slightly clouded, and with a whitish irregular line near the outer edge, with an orange-coloured, kidney-shaped spot near it, and a

roundish dark spot near the centre. The under-wings are dusky-white, with the veins and a crescent-shaped spot in the centre all dusky.

Mame'stra brassica.—During the latter part of the evenings of May and June, a middle-sized, brown moth may be seen very often flying in our gardens, and visiting our beds of cabbages and lettuces, of which its caterpillars are most destructive. This is the Cabbage Moth (*Mame'stra brassica*, and *Noctua brassica* of some naturalists). It measures about one inch and three-quarters across the opened fore-wings, which are dusky-brown, clouded with darker shades, and marked with pairs of dark spots on their front edge; from these spots proceed the streaks which mark the wings across; there are various spots on the wings, some yellowish, and those in the middle surrounded with white, the kidney-shaped one with a whitish-grey crescent round it, and blackish beyond; the wings have a grey, yellowish-striped fringe, and near this, at the point farthest from the body, they have a row of black, triangular marks; the hind-wings

are light brownish-grey, with dark veins; the body and head are of various shades of blackish-grey, with a darker stripe of the same colour down the centre of the back. During the day this moth rests on the shady sides of the stems of trees, or the branches of hedge-row bushes, and even by the side of clods on the soil.

The caterpillar is green, variously marked with grey or black, with a dark stripe down the back, and a dirty-yellow one down each side; the spiracles (breathing-holes) are white, surrounded with black, and close above the yellow stripe. The caterpillar is found in July, August, and September, feeding upon the hearts of cabbages and lettuces. The only remedies are destroying the moths whenever seen, and hand-picking the caterpillars. The latter bury themselves in the ground, and remain in the pupa or chrysalis state all the winter.—*The Cottage Gardener*.

Mamme'a. Mammee-tree. (The native name. Nat. ord. *Guttiferae*; Tribe, *Calophylleae*. Allied to *Garcinia*.)

Cultivated in the West Indies and South America for its fruit, called the Mammee Apple, or Wild Apricot, said to rival the Mangosteen. Stove evergreen trees, with white flowers. Cuttings of the half-ripened shoots in sand, under a bell-glass, and in bottom-heat; fibry, sandy loam, and a little dried leaf-mould.

M. africa'na. 60. July. Sierra Leone. 1823.
— *america'na*. 60. S. Amer. 1730.

Mammilla'ria. (From the diminutive of *mamilla*, a nipple; referring to the spirally-arranged tubercles on these plants. Nat. ord., *Cactea*; Tribe, *Echinocactea*. Syn., *Anhalonium*.)

Dwarf plants, composed of a number of tubercles, somewhat resembling the teats of animals; these are generally terminated with bunches of hairy bristles, and between them the flowers appear. To grow them successfully, they should be freshly dressed, or repotted, in sandy loam and peat, with a fair portion of brick rubble in April or May; afterwards kept in a close temperature, with plenty of atmospheric moisture, but little or no water given to the roots until they are rooting freely; then water may be given, and the stimulus to growth continued for two or three months, when moisture must be gradually withdrawn. They like plenty of sunshine at all times when fully established; and at the end of autumn the atmosphere must be gradually cooled, to enable the plants to stand dry, and in a dry atmosphere, and a temperature of from 45° to 50° during

the winter. No shade will be required, unless just after potting, before fresh growth is made. Those who try them in windows may easily give them the above treatment by placing them in a close box or pit for two months in summer. Easily propagated by offsets. Their greatest enemy is the red spider; plenty of syringing when growing in summer. Water somewhat liberally in summer, when in flower and growing; little or none must be given at other times.

Mancine'lla. A synonym of **Hippomane**.

Mandarin Orange. *Citrus nobilis*.

Mandevilla. (Named after H. J. Mandeville, Esq., formerly Consul at Buenos Ayres. Nat. ord., *Apocynaceæ*; Tribe, *Echitidæ*. Allied to *Echites*.)

Stove evergreen climber. Generally by cuttings of the small, stiff side-shoots, when about three inches in length, taken off close to the old wood, and inserted in sand, under a bell-glass, and in a mild bottom-heat; peat and loam. It does little good as a pot-plant, but is splendid when planted out and allowed room in a warm greenhouse or stove, where fine climbers are prized.

M. suaveolens. 20. White. June. Buenos Ayres. 1837. B. R. 1840, t. 7.

Mandiro'la. A synonym of **Achimenes**.

Mandrago'ra. (From *mandra*, an ox-stall, and *agaurus*, cruel; alluding to its poisonous effects when accidentally given to cattle with their fodder. Nat. ord. *Solanaceæ*; Tribe, *Atropeæ*.)

Hardy herbaceous perennials. Seeds; divisions of roots. Rich loam.

- M. autumnalis*. 1. Blue. September. S. Europe. This very handsome plant is supposed to be the mandrake of the Old Testament. Swt. Fl. Gard. ser. 2, t. 325. Syn., *Atropa Mandragora*.
 — *officina'rum*. 3. Blue. May. Levant. Common Mandrake.
 — *praecox*. 1. Yellow. March. Switzerland. 1819. Swt. Fl. Gard. t. 198.

Manettia. (Named after X. Manetti, an Italian botanist. Nat. ord., *Rubiaceæ*; Tribe, *Cinchonææ*. Allied to *Bouvardia*.)

Stove evergreen or herbaceous climbers. Cuttings of the young shoots in sandy soil, under a bell-glass; such kinds as *coccinea* also by division of the fleshy, tuberled-like roots as growth is commencing; sandy peat and fibry loam.

- M. bicolor*. 3. Scarlet, yellow. March. Rio Janeiro. 1843.
 — *coccinea*. 20. Scarlet. June. Guiana. 1806.
 — *cordifolia*. 5. Scarlet. August. Buenos Ayres. B. M. t. 3202. Syn., *M. glabra*.
 — *glabra*. Swt. Fl. Gard. ser. 2, t. 233. See *M. cordifolia*.
 — *Lygii* stum. 20. Pink. March. Cuba. 1822.
 — *micans*. Scarlet. Peru. 1865.
 — *splendens*. Crimson. May. Caraccas. 1840.
 — *uniflora*. 3. Rose. November. St. Martha. 1844.

Mangifera. Mango-tree. (From *mango*, the Hindoo name of the fruit, and *fero*, to bear. Nat. ord., *Anacardiaceæ*; Tribe, *Anacardiææ*.)

The Mango is the most esteemed fruit in India, having a grateful perfumed flavour. Stove evergreen trees, from the East Indies. Cuttings of the nearly ripe shoots in sand, under a glass, and in heat; peat and rich loam.

- M. foetida*. 20. Red. Malacca. 1824.
 — *glauca*. See *Elaeodendron glaucum*.
 — *indica*. 20. White. July. Tropical India. 1890. B. M. t. 4510.
 — *oppositifolia*. Yellow. June. Pegu. 1823. Syn., *Bonea burmanica*.

Manglesia. (Named after Captain Mangles, and his brother, Robert Mangles, Esq., of Sunning Hill, distinguished patrons of botany. Nat. ord., *Proteaceæ*; Tribe, *Grevillieæ*.) See *Grevillea*.

- M. glabra*'ta. See *Grevillea glabrata*.
 — *vestita*. 6-9. Purple. May. Swan River. A synonym of *Grevillea vestita*.

Mangli'la. A synonym of *Myrsine*.

Mango Ginger. *Cu'rcuma ama'da*.

Mangosteen. *Garci'nia*.

Mango Tree. *Mangi'fera*.

Mangrove. *Rhizo'phora*.

Manicaria. (From *manica*, a glove, referring to the spathe, or rolling-leaf which surrounds the flower-stem. Nat. ord., *Palmeæ*; Tribe, *Areceæ*.)

Stove palm. Seeds in a strong moist heat, in a hotbed; rich, sandy loam.

- M. sacci'fera*. 30. S. America. 1823. Mart. Palm. t. 124. Syn., *Pilophora testicularis*.

Ma'nihot. (The Brazilian name of the root. Nat. ord., *Euphorbiaceæ*; Tribe, *Crotoneææ*. Syn., *Janipha*. Allied to *Jatropha*.)

Greenhouse or stove evergreen shrubs; loam, peat, sand, and a little charcoal. Cuttings of firm shoots in sand under a bell-glass.

- M. æsculifolia*. 3. Central America. 1826. Syn., *Janipha æsculifolia*.

- M. carthaginensis*. 3. July. Carthagen. 1826. Syns., *Janipha Læstingii* and *Jatropha carthaginensis*. Jacq. Vind. iii. t. 77.
 — *digitata*. Blue, green. July. Australia. 1820.

- *diversifolia*. Perhaps a species of *Adriana*.
 — *foetida*. 3. Brown. Mexico. 1824. Syn., *Janipha foetida*.
 — *gracilis*. Brown, green. July. Brazil. 1822
 — *tenuifolia*. Blue, brown. June. Brazil. 1822. Syn., *M. tenuifolia*.
 — *sinuata*. Brown. July. Brazil. 1824.
 — *tenuifolia*. See *M. gracilis*, var. *tenuifolia*.
 — *utilissima*. 3. Brown. July. S. America. 1739. Syns., *Janipha Manihot*, B. M. t. 3071, *Jatropha Læstingii* and *J. Manihot*.

Manna. *Alha'gi*.

Manna Ash. *Fra'xinus o'rnus*.

Mantisia. Opera Girls. (Named after an insect, *Mantis*, to which the flowers have been compared. Nat. ord., *Scitamineæ*; Tribe, *Zingibereæ*. Allied to *Ginger*.)

Stove herbaceous perennials, from the East Indies. Division of the roots, as growth commences; sandy peat and fibry loam, well drained.

- M. saltatoria*. 1. Purple. July. 1808. B. M. t. 1320. Syn., *Globba purpurea*. Andr. Rep. t. 615.
 — *spatulata*. 1. Blue. June. 1823.

Manulea. (From *manus*, the hand; from a faint resemblance in the divisions of the flower. Nat. ord., *Scrophulariaceæ*; Tribe, *Manuleæ*. Allied to *Chænostoma*.)

Greenhouse evergreens, from South Africa. Several species are taken from this genus and added to *Lyperia*. Seeds, sown in spring, in a slight hotbed; cuttings of the young shoots, firm at their base, in sand, under a bell-glass, but without bottom-heat; sandy loam and peat, and leaf-mould.

- M. Cheiranthus*. 1. Orange. August. 1795.
 — *cordata*. See *Chænostoma cordata*.

 — *rubra*. 1½. Red. June. 1790.
 — *violacea*. See *Lyperia violacea*.
 — *viscosa*. See *Sphærandra viscosa*.

Manures are either animal, vegetable, or mineral. They directly assist the growth of plants, by entering into their composition, by absorbing and retaining moisture from the atmosphere, by absorbing the gases of the atmosphere, and by stimulating the vascular system of the plants. Manures indirectly assist vegetation, by killing predatory vermin and weeds, by promoting the decomposition of stubborn organic remains in the soil, and by protecting plants from violent changes of temperature.

All these properties seldom, if ever, occur in one species of manure; but each is usually particularized by possess-

ing one or more in a superior degree. That is the most generally applicable manure which is composed of matters essential to the growth of plants: the chief of these are carbon, hydrogen, and oxygen; therefore all animal and vegetable substances are excellent manures. It would evidently be of great benefit if every plant could be manured with the decaying parts of its own species. This rule might be so far followed as that the stems of potatoes, peas, etc., could be dug respectively into the compartments where those crops are intended to be grown in the following year; but such manure requires the addition of ammoniacal salts.

Some manures ameliorate a soil by absorbing moisture from the atmosphere. This property is, at least, as beneficial to ground that is aluminous as to that which is siliceous; for it is equally useless to either during periods of plentiful rain; but in the drought of summer, when moisture is much wanting to plants, it is beneficial to both; in very dry seasons it is even of greater importance to clayey than to light soils; for vegetation on the former suffers more from long-continued drought than on the latter, the surface of the clayey soil becoming caked and impervious to air, the only grand source of compensatory moisture that is available to the languishing plants, and which is more open to those which grow on light, and consequently, more pervious soils.

The following table of the comparative absorbent powers of many manures is extracted chiefly from "An Essay on the Use of Salt in Agriculture," by Mr. Cuthbert Johnson:

Horse manure evaporated previously to dryness, at a temperature of 100°, absorbed during an exposure of three hours to air saturated with moisture at 62°, 145 parts; putrefied tanners' bark, under similar circumstances (66°), 145 parts; unputrefied tanners' bark, 115 parts; cow-dung, 130 parts; pig-dung, 120; sheep-dung, 81; pigeon-dung, 50; refuse marine salt (60°), 49½; soot (68°), 36; burnt clay, 29; the richest soil (in one hour), 23; coal-ashes, 14; lime (part carbonate), 11; crushed rock-salt, 10; gypsum, 9; chalk, 4.

The absorbing power of a manure is much influenced by the state in which it is presented to the atmosphere. In a finely-divided state mere capillary attraction assists it; hence the importance of keeping the soil frequently stirred by hoeing, etc. But a mere mass of cotton, by means of capillary attraction, will ab-

sorb moisture from the air; yet it parts with it at a very slight elevation of temperature. It is of importance, therefore, to ascertain which are the manures that not only absorb but retain moisture powerfully. The following results of our experiments throw some light on this point:

Pig-manure evaporated to dryness at a temperature of 106°, and then moistened with six parts of water, required for being reduced to dryness again, at the above temperature, 135 minutes; horse-dung under similar circumstances, 90; common salt, 75; soot, 75; rich soil, 32; chalk, 29; poor soil (siliceous), 23; gypsum, 18.

These experiments point out a criterion by which we easily ascertain the comparative richness of any two given soils or manures: the most fertile will be most absorbent and retentive.

Some manures increase the growth and vigour of plants by stimulating their absorbent and assimilating organs. The stimulating powers of excrementitious manures arise from the salts of ammonia they contain.

Sir H. Davy found vegetation assisted by solutions of muriate of ammonia (sal-ammoniac), carbonate of ammonia (volatile salt), and acetate of ammonia. Night soil, one of the most beneficial of manures, surpasses all others in the abundance of its ammoniacal constituents in the proportion of three to one. It may be observed, that the nearer any animal approaches to man in the nature of its food, the more fertilizing is the manure it affords. We have no doubt that a languishing plant—one, for example, that has been kept very long with its roots out of the earth, as an orange-tree recently imported from Italy—might be most rapidly recovered, if its stem and branches were steeped in a tepid, weak solution of carbonate of ammonia; and when planted, an uncorked phial of the solution were suspended to one of the branches, to impregnate the atmosphere slightly with its stimulating fumes.

Manures are also of benefit to plants by affording some of the gases of the atmosphere to their roots in a concentrated form. A soil, when first turned up by the spade or plough, has generally a red tint, of various intensity, which, by a few hours' exposure to the air, subsides into a grey or black hue. The first colour appears to arise from the oxide of iron which all soils contain, being in the state of the red or protoxide; by absorbing more oxygen during the exposure, it

is converted into the black or peroxide. Hence one of the benefits of frequently stirring soils; the roots of incumbent plants abstract the extra dose of oxygen, and reconvert it to the protoxide. Coal-ashes, in common with all carbonaceous matters, have the power of strongly attracting oxygen. Every gardener may have observed how rapidly a bright spade of iron left foul with coal-ashes becomes covered with rust or red oxide.

Mineral manures assist plants by destroying predatory vermin and weeds. This is not a property of animal and vegetable manures—they foster both those enemies of our crops. Salt and lime are very efficient destroyers of slugs, snails, grubs, etc.

Stable-manure, and all decomposing animal and vegetable substances, have a tendency to promote the decay of stubborn organic remains in the soil, on the principle that putrescent substances hasten the process of putrefaction in other organic bodies with which they come in contact. Salt, in a small proportion, has been demonstrated by Sir J. Pringle to be gifted with a similar septic property; and that lime rapidly breaks down the texture of organized matters is well known.

There is no doubt that rich soils, or those abounding in animal and vegetable remains, are less liable to change in temperature with that of the incumbent atmosphere than those of a poorer constitution. This partly arises from the colour of the soils. Some manures, as salt, protect plants from suffering by sudden reductions of temperature, by entering into their system, stimulating and rendering them more vigorous, impregnating their sap, and, consequently, rendering it less liable to be congealed.

Mapa'nia. (Probably derived from the vernacular name. Nat. ord., *Cyperaceæ*; Tribe, *Hypolytrææ*.)

Stove, grass like plant. Division of the roots; seeds. Sandy loam and peat.

M. lucida. Young leaves tinged with red; older ones bright green, with three parallel nerves. Borneo. Ill. Hort. t. 557.

Maple. *A'cer.*

Ma'ppa. (Nat. ord., *Euphorbiaceæ*.) A synonym of **Macaranga**.

M. Portea'na. See **Macaranga Portea'na.**

Maranhao Nuts. *Bertholle'tia.*

Mara'nta. Arrow-root. (Named after *B. Maranti*, an Italian botanist. Nat. ord., *Scitamineæ*; Tribe, *Marantææ*. Allied to *Canna*.)

A kind of arrow-root is obtained from the

rhizome, or fleshy roots, of some of the species. Ornamental stove evergreens; division of the roots in spring; rich, sandy loam, with nodules of peat.

M. angustifolia. B. M. t. 2398. See *M. Touchat*. — *argentea.* Leaves silvery grey with deep green marks. Brazil. 1884.

Marattia. (Named after *J. F. Maratti*, an Italian botanist. Nat. ord., *Filices—Marattiaceæ*.)

Very ornamental stove or greenhouse evergreen ferns. Division in spring, or by spores; peat lumpy sandy, and coarse sand.

- M. alata*. 1½. Brown. August. Jamaica. 1798.
 — *cicutifolia*. Brown, yellow. Brazil. 1843.
 — *Cooperi*. Australasia. 1863. Greenhouse.
 — *fraxinea elegans*. 8. Brown, yellow. Norfolk Island.
 — *lævis*. A synonym of *M. alata*.
 — *purpurascens*. 6. Ascension Island.
 — *cristata*. Fronds crested.
 — *Raddiana*'na. Brazil. 1878. Syn., *Gymnotheca Raddiana*.

Marcgravia. (After *Georg Marcgraf*, who wrote on the natural history of Brazil. Nat. ord., *Ternstroemiaceæ*; Tribe, *Marcgraviææ*.)

- M. dubia*. Probably a species of *Pothos*.
 — *indica*. Wall climber. 1884.
 — *paradoxa*. Tropical America.
 — *umbellata*. Tropical America.

Margins of streams and other ornamental waters must always accord with the surroundings in which they are placed. Art, therefore, must imitate each in its proper place, not always by a studious picturesque arrangement of the marginal accompaniments in each case, but by excavating the groundwork, planting the trees and shrubs, and leaving the rest to the motion of the waves of the water. After the effects of one winter, stones or gravel may be deposited in spots suitable for stony or gravelly shores.

Margyrica'rpus. (From *margaron*, a pearl, and *karpos*, a seed-vessel; referring to the pearly succulent fruit. Nat. ord., *Rosaceæ*; Tribe, *Poteriææ*. Allied to *Agrimonia*.)

Hardy or half-hardy evergreen. Cuttings of half-ripened shoots in April or May, in sand, under a bell-glass. Seeds. Sandy peat and loam.

- M. setosus*. 2. Green. Peru. 1829.

Maria'lia. See **Tovomita**.

Maria'nthus. (From *mairein*, to shine, and *anthos*, a flower; referring to the bright, various-coloured flowers. Nat. ord., *Pittosporææ*. Allied to *Sollya*.)

Greenhouse, trailers or climbers. Cuttings of young side-shoots in sand, under a bell-glass, in May; sandy loam, fibry peat, with potsherds and charcoal, to keep the soil rather open.

- M. cœruleo-punctatus*. 4. Blue. April. Swan River. 1840. B. M. t. 3893. Syn., *Campylanthera elegans*.
 — *Drummondiana*'rus. Lilac. W. Australia. 1865. Evergreen. B. M. t. 5521.
 — *fruticosus*. Swan River. 1841.
 — *ringens*. Golden-red. November. Swan River. Syn., *Calopetalon ringens*.

Marica. (From *maraino*, to flag; referring to the ephemeral nature of the flowers, which last hardly a day. Nat. ord., *Irideæ*; Tribe, *Moræææ*. Allied to *Iris*.)

Greenhouse herbaceous perennials. By seed, sown in a slight hotbed in spring, or by division of the rhizomes. Sandy loam, peat, and leaf-mould.

- M. aphylla*. See *Bobartia aphylla*.
 — *brachypus*. Yellow, red-brown. Trinidad. 1871. Syn., *Cypella brachypus*.
 — *cœrulea*. 2. Blue. May. Brazil. 1818. B. M. t. 713.
 — *cælestis*. 3. Blue. Brazil. 1829.

 — *spathacea*. See *Bobartia spathacea*.

Marigold. *Cale'ndula officinalis*.
 Varieties.—Single, Common double. Largest very double, Double lemon-coloured, Great Childing, Small Childing. The single-flowered, and those which have the darkest orange colour, possess the most flavour.

Soil.—Light, dry, poor, and unshaded.

In rich ground they grow larger, but lose much of their flavour.

Sow any time from the close of February until June; or in autumn, during September. If left to themselves, they multiply from the self-sown seed. Sow in drills, ten inches apart; the plants to be left where raised, being thinned to ten or twelve inches asunder; but when the seedlings are two or three inches in height, they may be removed into rows at similar distances as above. Water must be given moderately every other day in dry weather until established.

Gathering.—The flowers, which the spring-raised plants will produce in the June of the same year, but those of autumn not until that of the following one, will be fit to gather for keeping in July, when they are fully expanded, as well as for use when required. Before storing, they must be dried perfectly.

Marigold (African). *Tagetes erecta*.

Marigold (French). *Tagetes patula*.

Marigold (Great Cape). *Calendula hybrida*.

Mar'la. (From *marile*, live embers or sparks; referring to pellucid dots on the leaves, or yellow fringe round the seed-pod. Nat. ord., *Ternströmiaceæ*; Tribe, *Bonnetiææ*. Allied to *Mahurea*.)

Ornamental stove evergreen shrub. Cuttings of shoots, when short, and getting firm at their base; sandy peat and loam, well-drained, and open.

M. racemosa. 12. Yellow, green. August. W. Ind. 1827.

Mar'scus. (From the Celtic *mar*, a swamp; the habitat of this genus. Nat. ord., *Cyperaceæ*.)

M. umbilicatus. Syns., *M. sparganifolius* and *Cyperus natalensis*.

Marjoram. (*Ori'ganum*.) *O. majorana*, Sweet or Summer Marjoram. *O. heracleoticum*, Winter Marjoram. *O. onites*, Common or Pot Marjoram.

Soil.—Light, dry, and moderately fertile. The situation cannot be too open.

Propagation.—The Sweet Marjoram is propagated solely by seeds; the others by seed, as well as by parting their roots, and slips of their branches. Sow from the end of February, if open weather, to the commencement of June; but the early part of April is best. Portions of the rooted plants, slips, etc., may be planted from February until May, and during September and October.

Sow in drills, six inches apart, the seed being buried not more than a

quarter of an inch deep. When the seedlings are two or three inches high, thin to six inches, and those removed may be pricked in rows at a similar distance. Those of the annual species (*O. majorana*) are to remain; but those of the perennials, to be finally removed during September, water being given at every removal, and until the plants are established.

Plant slips, etc., in rows ten or twelve inches apart, where they are to remain; they must be watered moderately every evening, and shaded during the day until they have taken root. In October the decayed parts of the perennials are cut away, and some soil from the alleys scattered over the bed about half an inch in depth, the surface of the earth between the stools being previously stirred gently. The tops and leaves of all the species are gathered when green, in summer and autumn, for use, in soups, etc.; and a store of the branches are cut and dried in July or August, just before the flowers open, for winter's supply.

Seed.—If a plant or two are left un-gathered from the Pot Marjoram, the seed ripens in the course of the autumn. But the others seldom ripen their seed in this country; consequently it is usually obtained from the south of France or Italy.

Forcing.—When the green tops are much in request, a small quantity of seed of the Summer Marjoram is sown in January or February, in a moderate hotbed.

Market-Gardener, one who grows garden produce for sale.

Marking Fruit. *Anacardium*.

Marl is a compound of chalk (carbonate of lime) with either siliceous sand or alumina. In the first instance it is a siliceous marl, best applied to heavy soils; and in the latter a clayey marl, adapted for light lands. Slaty and shell-marls are varieties of the siliceous. The relative proportions of the constituents vary indefinitely, the chalk amounting to from 15 to 75 per cent. The quantity applied per acre must also vary greatly, according to the object to be attained. To render a light soil more tenacious, 100 tons per acre of clayey marl are not too much; neither is the same quantity of siliceous marl an excess, if applied to a heavy soil to render it more friable.

Ma'rlea. (From *marlija*, the Indian name. Nat. ord., *Cornaceæ*. Allied to *Nyssa*.)

Greenhouse evergreen shrub. Cuttings of

shoots, or rather, short, stubby side-shoots, taken off with a heel, in sand, under glass; peat and loam.

M. begoniæfolia. 4. Yellow. China. B. R. 1838, t. 61.

Marrubium. Horehound. (From the Hebrew *marrob*, bitter juice. Nat. ord., *Labiatae*; Tribe, *Stachydeae*.)

Hardy herbaceous perennials. Division of the roots in spring; by slips, in a shady place, or shaded for a time, and by seeds; common garden-soil.

M. affine. See *M. leuonoides*.

— *alyssum*. 1½. Purple. July. Spain. 1597.

Mathiola. Stock Gilliflower. (Named after *P. Mathioli*, an Italian botanist. Nat. ord., *Cruciferae*; Tribe, *Arabideae*.)

The annuals, such as the Ten-week stocks, may be sown from March to May for summer decoration, and in August and September, to stand over the winter for spring early flowering. For the latter purpose, none beat the Intermediate, Queens, Bromptons, and other biennials. Sow in June, plant in sheltered places, and in pots, to be kept in cold pits, and turned out early in spring. Seeds are recommended to be saved from the neighbourhood of double flowers, which we consider of no importance. The only true theory to get double flowers is to leave few seeds on a plant, and give it very high cultivation, and as much sunshine as possible. For fine flowering, all these prefer rich, light soil. The best of them may be successfully preserved by cuttings under a hand-light, and then kept in a cold pit in winter. The shrubby greenhouse kinds are easily propagated by cuttings, and delight in a rich, sandy soil.

HARDY ANNUALS.

Matonia. (Named after the late *Dr. Maton*. Nat. ord., *Filices*.)

Stove fern. See **FERNS**.

- M. pectinata*. Yellow. May. Mount Ophir 1839.

Matricaria. (From *matrix*, a female. Formerly used in uterine diseases. Nat. ord., *Compositae*; Tribe, *Anthemideae*.)

Hardy annuals or perennials. For culture see **ANTHEMIS**.

- M. eximia grandiflora aurea*. Garden variety 1888.
 — *pyramidalis*. Garden variety with pyramidal habit. Rev. Hort. 1886, p. 557 fig. 181.

Matricaria inodora flore-pleno, is a very handsome double-flowered form of the common *May Weed*. It grows to about two feet high, and produces a profusion of white globose flower heads, resembling a pompon *Chrysanthemum*; it produces very little seed, but may easily be propagated by cuttings.

Maurandya. (Named after *Professor Maurandy*, of Carthage. Nat. ord., *Scrophulariaceae*; Tribe, *Antirrhineae*.)

Greenhouse evergreen twiners, from Mexico. Seeds sown in a slight hotbed, in spring; and cuttings of shoots in sandy soil, in spring or autumn; rich, sandy loam, with a little peat or leaf-mould; will flourish in a cool greenhouse and in summer on wires, and fences, and pillars in the open air.

Mauria. (Named after *A. Mauri*, an Italian botanist. Nat. ord., *Anacardiaceae*; Tribe, *Anacardiaceae*. Allied to *Duvaua*.)

Stove evergreen trees, with pinkish flowers, from Peru. Cuttings of ripe shoots in heat, under a hand-glass; common loam and a little peat; usual stove treatment.

- M. heterophylla*. 20. 1822.
 — *simplicifolia*. 20. 1822.

Mauritia. (Named after *Prince Maurice*, of Nassau. Nat. ord., *Palmeæ*; Tribe, *Lepidocaryeæ*.)

Stove palms. Seeds in a hotbed, in spring; rich, fibry, sandy loam. Winter temp., 55°; summer, 60° to 90°.

M. arnata. 40. Brazil. 1824.
— *jacuosa*. 40. White, green. Surinam. 1816.
— *vinifera*. 40. Maranhão. 1823.

Maxillaria. (From *maxilla*, the jaw of an insect; referring to a resemblance of the columns and labellum. Nat. ord., *Orchideæ*; Tribe, *Vandæ-Macillariæ*.)

Stove orchids. Divisions of the plant in spring; fastened on wood covered with sphagnum, or raised in baskets filled with sphagnum, old wood, turfy peat, and charcoal. Winter temp., 55° to 65°; summer, 60° to 90°. Dry in winter; moist when growing.

MEASURES.

CORN MEASURE.

4 Gills	1 Pint, containing	34 $\frac{3}{8}$ Cubic Inches.
2 Pints	1 Quart	69 $\frac{3}{8}$ " "
4 Quarts	1 Gallon	277 $\frac{1}{4}$ " "
2 Gallons	1 Peck	554 $\frac{1}{2}$ " "
4 Pecks	1 Bushel	2218 $\frac{1}{8}$ " "
4 Bushels	1 Sack	5 $\frac{1}{8}$ Cubic Feet.
8 Bushels	1 Quarter	10 $\frac{1}{4}$ " "
5 Quarters	1 Load	51 $\frac{1}{2}$ " "

TIMBER MEASURE.

A load of timber, unhewn, is 40 cub. ft.	A load of 2 $\frac{1}{2}$ inch plank 240 square feet.
squared, 50 "	3 " 200 "
1 inch plank 600 sq. ft.	3 $\frac{1}{2}$ " 170 "
1 $\frac{1}{2}$ " 400 "	4 " 150 "
2 " 300 "	

LAND MEASURE.

The *English* statute acre contains 4840 square yards; the *Scotch*, 6150; the *Irish*, 7840; the *Devonshire*, customary, 4000; the *Cornish*, 5760; the *Lancashire*, 7840; the *Cheshire* and *Staffordshire*, 10,240; the *Wiltshire* tenantry, 3630.

The *French* arpent is an English acre, and three-fourths of a rood. The *Strasbourg* acre is nearly half an English acre; the *Prussian* morgen is not quite three-fourths of an acre.

LONG MEASURE.

12 Inches	1 Foot.	40 Poles	1 Furlong.
3 Feet	1 Yard.	8 Furlongs	1 Mile.
6 Feet	1 Fathom.	3 Miles	1 League.
5 $\frac{1}{2}$ Yards	1 Pole.	69 $\frac{1}{2}$ Miles	1 Degree.

SQUARE MEASURE.

Inches.	Feet.	Yards.	Poles, Rods, or Perches.	Roods.	Acres.
144	1	1	1	1	1
1,296	9	1	1	1	1
39,204	272 $\frac{1}{4}$	30 $\frac{1}{4}$	1	1	1
1,568,160	10,890	1210	40	1	1
6,272,640	43,560	4840	160	4	1

30 Acres are 1 Yard of Land.

100 Acres are 1 Hide of Land.

640 Acres are 1 Square Mile.

CUBIC MEASURE.

1728	Cubic Inches	make	1	Cubic Foot.
27	„	Feet	1	„ Yard.
40	„	„	of Rough Timber	}	1 Load.
50	„	„	of Hewn do.		
108	„	„	1	Stack of Wood.
128	„	„	1	Cord.

HEAPED MEASURES.

Our market-gardeners, and retailers of fruit, potatoes, etc., generally vend their commodities as if the Act of Parliament, 5 and 6 Will. IV. c. 63, did not exist. By this statute selling by heaped measure is forbidden under a penalty of not more than 40s. for every such sale. Section 8 provides that, as some articles heretofore sold by heaped measure are incapable of being stricken, and may not inconveniently be sold by weight, it is enacted, that all such articles may henceforth be sold by a bushel-measure, corresponding in shape with the bushel prescribed by the 5 Geo. IV. c. 74, for

the sale of heaped measure, or by any multiple or aliquot part thereof, filled in all parts as nearly to the level of the brim as to the size and shape of the articles will admit; but nothing herein shall prevent the sale by weight of any article heretofore sold by heaped measure. The 5 Geo. IV. c. 74, thus referred to, enacts, by section 7, that for potatoes, fruit, etc., the bushel shall be made round, with a plain and even bottom, be nineteen inches and a half from outside to outside, and capable of containing 80 lb. weight of water.

WOOD FUEL.

English Measure.—Wood-fuel is assized into shids, billets, faggots, fall-wood, and cord-wood. A shid is of fall-wood and cord-wood.

A *shid* is to be four feet long, and according as they are marked and notched, their proportion must be in the girth—viz., if they have but one notch, they must be sixteen inches in the girth; if two notches, twenty-three inches; if three notches, twenty-eight inches; if four notches, thirty-three inches; and if five notches, thirty-eight inches about.

Billets are to be three feet long, of which there should be three sorts, namely, a single cask, and a cask of two. The first is seven inches, the

second ten inches, and the third fourteen inches about. They are sold by the hundred of five score.

Faggots are to be three feet long, and, at the band, of twenty-four inches about, besides the knot; of such faggots fifty go to the load.

Bavins and *Spray-wood* are sold by the hundred, which are accounted a load. *Cord-wood* is the bigger sort of firewood; and it is measured by a cord or line, whereof there are two measures—that of fourteen feet in length, three feet in breadth, and three feet in height; the other is eight feet in length, four feet in height, and four feet in breadth.

MEASURE OF WOOD.

1000	Billets of Wood	=	1	Cord.
10	Cwt. of Wood	=	1	Cord.
1	Cord of Wood	=	$\frac{1}{2}$	Chaldron of Coals.
100	lb. of Wood	=	1	Quintal of Wood.

Mecono'psis. (From *mekan*, the poppy, and *opsis*, like. Nat. ord., *Papaveraceæ*; Tribe, *Eupapaveræ*.)

Hardy herbaceous perennials. Divisions of the plant in spring, and seeds (which ripen freely), at the same time; rich, sandy soil.

Medico'sma. (From *medica*, and *osme*, smell; the flowers are scented like

those of *Citrus medica*. Nat. ord., *Rutaceæ*. Syn., *Acronychia*.)

A fine greenhouse evergreen tree, producing sweet-scented blossoms, not unlike those of the orange. Cuttings of small side-shoots in July, in sand, under a bell-glass; soil, sandy loam and peat. Winter temp., 40° to 45°.

M. Cunninghamsi. White. July. Moreton Bay. 1938. Syn., *Acronychia Cunninghamsi*. B. M. t. 3994.

Medinilla. (Named after *J. de Medinilla y Pineda*, governor of the *Marianne Islands*. Nat. ord., *Melastomaceæ*.)

Stove evergreen shrubs. Cuttings of stumpy side-shoots root the safest, though cuttings of the young shoots root freely, when damping is avoided, in sand, with a little peat, under a bell-glass, and in a bottom-heat; peat and loam, fibry and sandy. Winter temp., 48° to 55°; summer, 60° to 85°.

Medlar. *Me'spilus germanica*.

Varieties.—Blake's Large; Dutch, largest fruit; Nottingham, small, but best flavoured; Stoneless, inferior, but keeps longer than others.

Propagation: by Seed.—This is a tedious mode, the seed usually lying two years before it germinates. Sow, immediately the fruit containing the seed decays, in common, light soil. Water the seedlings frequently in dry weather, thin them to two feet apart; and when four or five years old they will be fit for final planting.

By Layers.—This may be done in February and March, making use of shoots of the previous year. They will have rooted by the autumn.

Grafting and Budding may be done on the White Thorn; but the Pear is a better stock for the Medlar.

Soil.—A well-drained, but retentive loam suits it best.

Planting, Pruning, etc.—See the directions given for the Pear.

Storing.—The fruit ought not to be gathered until November, for if the gathering is made before the fruit is fully matured, it shrivels without ripening in its decay. Spread them singly upon sand, the calyx, or open side down-

wards, and dipping the stalk end in a strong brine of common salt and water, which is said to check the occurrence of mouldiness.

Medlar, Japanese. *Photinia japonica*.

Medusa's-head. *Euphorbia caput Medusæ*.

Medu'sea major. A synonym of *Euphorbia caput Medusæ*.

Megaclonium. (From *megas*, large, and *kline*, a bed; referring to the axis, or rachis, on which the flowers are borne. Nat. ord., *Orchidææ*; Tribe, *Epidendrææ-Dendrobizææ*. Allied to *Cirrhoptetalum*.)

Stove orchids. Division of the plant in spring; shallow baskets in sphagnum, rotten wood, charcoal, and fibry peat. Winter temp., 60°; summer, 60° to 90°.

M. bufo. Brown, purple, with black hairs. Summer. Sierra Leone. 1839.

— *Clarkei*. Green, purple. W. Tropical Africa. 1891.

— *falcatum*. 1. Yellow, red. March. 1824. B. R. t. 989.

— *scaberulum*. Dull purple, whitish green. Pondoland. 1888.

— *velutinum*. Purple, yellow. Sierra Leone. 1845.

Megarhi'za. (From *megas*, large, and *rhiza*, a root; because of its large tuberous rootstock. Nat. ord., *Cucurbitaceææ*. Allied to *Elaterium*.)

Hardy tuberous perennial, producing an annual trailing stem. Seeds in a slight hotbed in spring. Good light soil.

M. californica. California. 1880. Garden, 1880, p. 147.

Mega'sea ciliata. A synonym of *Saxifraga ligulata*.

Meiracyllium. (From *meiracyllion*, a little boy; probably in reference to the small size of the plants. Nat. ord., *Orchidæææ*; Tribe, *Epidendræææ-Pleurothalleæææ*.)

Stove epiphytes; should be grown on blocks. For cultivation, see ORCHIDS.

M. gemma. Amethyst. Mexico. Rchb. Xen. iii. t. 208, fig. 1.

Melaleuca. (From *melas*, black, and *leukos*, white; referring to the colours of the old and young bark. Nat. ord., *Myrtaceæææ*; Tribe, *Leptospermeæææ*.)

Evergreen shrubs, from New South Wales, except where otherwise mentioned. Cuttings of

the shoots in May, as they are getting firm at their base, and not more than three inches in length, in sand, under a bell-glass; peat and loam, most of the latter, with a fair portion of sand, and nodules of charcoal. Winter temp., 38° to 45°. Many are about as hardy as a myrtle, and will stand against a conservatory wall with a little protection.

Melia'nthus. Honey Flower. (From *mel*, honey, and *anthos*, a flower; the tubes contain a copious supply of honey-like juice. Nat. ord., *Sapindaceæ*; Tribe, *Melianthææ*.)

The natives obtain honey for food by shaking the branches of *Melia'nthus major* when in blossom. Evergreens, from the Cape of Good Hope. Cuttings of young shoots in sandy soil, under a hand-light; rich, sandy soil; require the protection of a greenhouse, cold pit, or a conservatory wall in winter.

- M. com'o'sus*. 3. Yellow. 1820. B. R. t. 45.

Melissa Culture. This hardy herbaceous plant has a citron scent and aromatic flavour. It is cultivated now only for making a grateful drink for the sick, and sometimes for culinary purposes.

The Soil best suited to its growth is any good friable, but rather inclining to clayey than sandy.

Planting.—It is propagated by root division (of which the smallest piece will grow), and by slips of the young shoots. The first mode any time during the

spring and autumn, but by slips from June to August. If divisions of an old plant are employed, they may be planted at once where they are to remain, at twelve inches apart; but if by slips, they must be inserted in a shady border, to be thence removed, in August or September, to where they are to remain. At every removal water must be given, if dry weather, and until they are established. During the summer they require only to be kept clear of weeds. In October the old beds (which may stand for many years) require to be dressed, their decayed leaves and stalks cleared away, the soil loosened by the hoe or slight digging and manure given.

Old beds may be gathered from in July, for drying, but their green leaves, from May to September; and those planted in spring will even afford a gathering in the autumn of the same year. For drying, the stalks are cut, with their full clothing of leaves, to the very bottom, and the drying completed gradually in the shade. The variegated form has the additional advantage of being highly ornamental.

Meli'ttis. Bastard Balm. (The same derivation as *Melissa*. Nat. ord., *Labiatae*; Tribe, *Stachydeæ*.)

Same culture as *MELISSA*.

- M. melissophyllum*. 1. Creamy-white, blotched with pink or purple. May. England. Eng. Bot. ed. 3, tt. 1062-3.
 — *alpina*. 2. Flesh. May. Switzerland.
 — *grandiflora*. 1. White, yellow. May. England.

Mello'ca. See **Ullucus**.

Meloca'tus. Melon Thistle. (From *Melon*, a melon, and *kaktos*, the name given by Theophrastus to a spiny plant. Nat. ord., *Cactææ*.)

This genus differs from *Echinocactus* in having the flowers produced on a head covered with dense, woolly, and bristly hairs, called a tomentum, while those of *Echinocactus* issue from the bare ribs, or angles. Treatment similar to that for *MAMMILLARIA*. Suckers and offsets; loam, peat, and lime-rubbish.

- M. communis*. 1-1½. Rosy-red. W. Indies. 1788. B. M. t. 3090. Turk's Cap.

Melolo'ntha. Every one knows the common May-bug, or Cockchafer (*Melolontha vulgaris*); a drawing and a description of its grub are given at page 15, vol. v., of "The Cottage Gardener." This grub very closely resembles that of another species, *M. horticola*, Garden Beetle, or Brackenclock—*Phyllopertha* of some entomologists. The latter beetle (*Ibid.*, ii., 171) is found in June and July, among the petals of white roses. It is nearly half an inch long, and rather less than a quarter of an inch broad. Its wing-cases are reddish-brown, shining, and shorter than the body; the body and head are dark green, and the antennæ reddish, having at their ends a dark-green club. It also feeds on the leaves of apples, pears, and roses, gnawing them full of small holes, and even transferring its attacks to the young fruit of the apple. During the latter part of July the female retires into the earth for the purpose of there depositing her eggs, from which the grubs speedily are produced, and feed upon the roots of plants, especially of grass. The only mode of reducing the number of these beetles is by searching for them during the evening, when, if detected, they stiffen their outstretched legs, and feign death; but in the day they fly about swiftly, and are captured with great difficulty. It is said that when grass suffers from the grubs of either of these beetles, they may be extirpated by watering with the ammoniacal liquor from gas-works.

Mel'on. (*Cu'cumis me'lo*.)

Varieties.—These are so numerous, that we must be very severe in our selection, confining ourselves to such as are most generally useful in Britain; and these we must classify according to their habits.

Cantaloups, the Rocks, the Green-fleshed, the Valentia, or Winter, and the Persians, with their various hybrids. Amongst the *Cantaloups* we have both round and oblong, plain and netted, the Orange, the Montagnes, etc. In the *Rocks* we have the Small Scarlet-fleshed, the Black, the Large, and the Early, etc. In the *Green-flesh* class we may point to the Beech-wood, which may almost be considered the type of this section, the Small Green-fleshed Egyptian, of exquisite flavour, and thin rind;

these, with the various varieties known by the name of Snow's, Terry's, the Kew-green-flesh, etc. These are the most generally useful melons, being hardy, free-setters, and not liable to rot or canker.

Next we may advert to the *Winter Melons*, a class which will keep a long time after they are cut: and the *Valentia* may be placed amongst this division. Lastly, are the *Persians*, with their useful hybrids. The types of these Persian hybrids are, principally, the Isaphan, the Dampsha, the Gernek, and the Hoo-saine.

Propagation: by Seed.—Most practical men prefer old seed to new, as running less to bine. A bottom-heat of from 75° to 85° is essential; and when the seedlings are up, and just before the second set of leaves begin to appear, the young plants may be potted into five-inch pots, two in a pot, in a soil of three parts strong loam, enriched with manure. A temperature of 70° to 80° must be secured to them, and the pots should be plunged. As soon as the central shoot begins to sprout from between the seed-leaves it may be pinched off; and this, if other points be right, will cause the protrusion of a pair, or more, of shoots, more fruitful in character, and these are enough as "leaders." In about a fortnight afterwards they will be fit for the fruiting-bed.

By Cuttings.—This mode of culture has been recommended by some, as serving to restrict that excessive luxuriance which is frequently inimical to fertile blossoming. Under proper culture the plan answers; but, on the whole, the seedling plan is the better. It is, however, a certain mode of perpetuating choice kinds, and as such should not be lost sight of. Healthy, free-growing, yet short-jointed shoots, should be selected, and the usual bottom-heat and atmospheric temperature must be secured; in addition to this, there must be a liberal amount of atmospheric moisture, and the close treatment, with shading, incidental to the growth of cuttings. When established, the plants will need no "stopping;" and they require a more generous soil when finally planted.

Subsequent Culture.—The melon is fruited by a variety of modes, but in all a certain amount of bottom-heat, as well as atmospheric, is absolutely necessary. The bottom-heat should never descend below 70°, nor range above 90°, whilst an atmosphere not below 65°, nor above 80°, will be most suitable, permitting, however, a rise of eight or ten degrees

from sunshine. In no situation can the melon endure shade.

Culture in the Dung-bed. (For preparation of this see **Hotbed**.)—The earliest melons are generally sown about the middle of January, in a seed-bed specially prepared. Great caution is necessary; and when the plants are up, and the two seed-leaves fully developed, they may be planted out singly in five-inch pots, in rich soil. About this time the ridging-out bed must be got up for their reception, and this must be composed of materials perfectly sweet. Regular ventilation and frequent waterings will soon render the air within perfectly sweet; and then the hills of soil may be introduced; in doing which it is good practice to form hollows two-thirds the depth of the bed, and to fill them to the ordinary surface with brickbats or rubble, laying a turf with the grass downwards on the top, and on this the hillocks may be placed. The young plants will, by this time, have produced three or four shoots each, and it is advisable to retain two of the best on each. They may now be ridged out, and must afterwards be occasionally watered when dry; watering, according to the weather, also the sides of the frame and the uncovered dung almost daily. Henceforth, regular linings must be supplied, and those often turned and watered; maintaining steadily the temperatures, and taking care that the bottom-heat in no part of the interior exceeds 90°. As strong linings will be requisite at this early period, much water will be necessary twice or thrice a week, round the insides of the frames, and next to the linings, to prevent burning. As soon as the plants begin to spread, the remaining soil must be added; each light requiring, in the whole, from two to three barrowloads. The surface of the bed must be formed convex, the plants occupying the highest point. Two plants are enough for each light, and a shoot may be led to each angle of the light, and then the main shoots, taking the whole light, will form the letter X, the centre of the letter indicating the ridging-out point. As soon as each of these shoots reaches to within from six to nine inches of the frame side, it must be pinched, and the laterals forced out by this pinching will produce blossoms, some males, others females; the former generally preponderating.

The female blossoms must be carefully "set" or impregnated daily, choosing about two o'clock, p.m., for the operation, when the pollen will be dry.

As soon as from three to four fruits are secured on each plant, and these are as large as a pigeon's egg, all the blossoms must be kept cut away, male and female, as they appear. Each axillary shoot with a fruit must be pinched or stopped three or four eyes beyond the fruit; and frequent stopping practised with all the other portions, removing at all times coarse shoots which threaten to overpower the bearing portions. The chief object should be to expose as much healthy foliage as possible, and that connected with bearing portions, to the light, not suffering late-formed leaves to overshadow the older healthy leaves. Still, the sides of the frame must be occasionally watered; and when the fruit is as large as a hen's egg, a liberal watering of liquid manure may be given, avoiding, however, wetting the collars of the plants at all times. Ventilation must be daily had, but much caution is necessary; good linings must be maintained, in order to support the necessary temperature with ventilation. By these means, fine, ripe Cantaloups or Beechwoods may be cut by the middle of May. We may add that the root-watering may require to be repeated, but water must be entirely withheld a week or two before they commence ripening, and an extra amount of ventilation used during the ripening period.

The main features of their culture in *houses* or *pits*, or on *trellises*, are precisely the same, except that, having a greater depth of soil, and more room to ramble, a much greater length of main shoot may be allowed before stopping. In whatever situation, about 80° of bottom-heat, and an average of 75° atmospheric, will be found to suit them best, except that in proportion as the sun-light increases they will readily bear an increase of from 5° to 10° both to the roots and branches.

Bed.—Although a common hotbed is generally used for this plant, yet a pit is more economical of heat, and, by enabling a more regular temperature to be sustained, renders the fruit in greater perfection. The pit is a rectangular frame or bin, built of nine-inch brick-work, and inclosed by a glass case of the necessary dimensions. Mr. Smith, gardener to A. Keith, Esq., of Ravelstone, N.B., has suggested a mode of building a pit which renders the renewal of the heat in it easy; and, as the committee appointed to examine it report, is the means of considerable saving compared with the common mode of forming an open bed. But the facility with which linings may be applied is its best feature.

The accompanying sketch will at once show the form of the pit and Mr. Smith's mode of applying the linings. A is the pit, the side of which, *a a*, instead of being a continuous piece of brick-work, are merely rows of pillars six feet apart;

and the brick-work of the frame, *b b*, is supported, by bars of iron reaching from pillar to pillar. An outer wall *c c*, is constructed at two and a half feet distance from the pillars on each side; thus two bins are formed in which the linings are inserted, as is found necessary, and are kept close covered with thick boards; *d* represents the lights, which thus are formed without any wooden frames. For other modes of construction, see **Hot-bed Pits**, etc. If a common hotbed is employed, fifteen barrow-loads of dung is the usual allowance to each light, which make it about six inches higher than is allowed for the cucumber bed of largest dimensions.

If a *melon-house* be employed, the following is the form and mode adopted by Mr. Fleming:

“The house is twenty-eight feet long, and fifteen wide, and is heated by means of a saddle boiler, with four-inch pipes passing round the outside of the pit, which pipes are fitted with cast-iron troughs, for holding water to regulate the moisture of the atmosphere. Beneath the pit is an arched chamber, *a*, along the front of which runs the flue, *b*, imparting a slight degree of heat to the soil above, and also serving to heat a series of arches, *c*, which run along beneath the path, and are entered from a house in front, *d*, and which are used for forcing rhubarb, etc., in the winter.”—“Gardeners' Chronicle.”

Culture of the Persian kinds.—These are much more tender than the ordinary green-fleshed melons; they will not endure so low a temperature, and neither will they thrive in so moist an atmosphere. A high authority, speaking of the Persian melons, has thus observed:—“They are found to require a very high

temperature, a dry atmosphere, and an extremely humid soil, while they are at the same time impatient of an undue supply of moisture, which causes spottings and decay long before the fruit is ripe."

We are informed that in Persia, where the melon grows in the open fields, that the ground where they are cultivated is crossed in various ways by streams, between which the melons are placed on raised beds highly manured. It would seem, therefore, that in order to excel in their culture, the following may be taken as maxims:—1st. The brightest of glass is requisite, to admit every ray possible of the sunlight. 2nd. A very high atmospheric temperature must be sustained, and especially in order that the cultivator may be enabled to ventilate freely, to prevent the accumulation of damp. 3rd. A rich soil, dry in its upper surface, but rather moist beneath. It is urged by those who have been successful in their culture, that they should be trained on trellises; and there is no doubt the opinion is correct. They may, however, be trained against the back walls of stoves, or grown in large pots, to which in due time a dish of water may be affixed, and the shoots trained on portable trellises.

We will conclude with a few general remarks. The foliage of melons, of whatever kind, should never be ruffled or disturbed; training and stopping, therefore, must be attended to in due time. Melons should not be encouraged to become luxuriant until a crop of fruit commences swelling; after this it is almost impossible to encourage them too much. Again, they should never be watered indiscriminately overhead, after the manner of cucumbers, unless it be some of the ordinary green-flesh kinds, during periods of continued heat and a dry atmosphere.

Diseases.—These are few properly so called except the gum and canker, and those are mostly engendered by wounds or bruises on gross subjects, producing a sort of vegetable gangrene. When such occurs, it is a good plan to place a slate, tile, or piece of glass beneath the affected part, and to pile a mixture of quick-lime three parts, and charcoal-dust one part, in a hillock around and above the wound, changing the same when it becomes damp.

Insects.—See *Acarus*, *Aphis*, and *Thrips*.

Melon Pumpkin. *Curcubita melo-pepo*.

Melon Thistle. *Melocactus*.

Melon Turk's-Cap. *Melocactus communis*.

Melon, Water. *Citrullus vulgaris*.

Melo'thria punctata. A synonym of *Zehneria scabra*.

Melvillea speciosa. A synonym of *Cuphea Melvillea*. B. R. t. 852.

Meme'cyon. (Dioscorides' name for the fruit of the Arbutus. Nat. ord., *Melastomaceæ*; Tribe, *Memecycleeæ*. Allied to *Mouriria*.)

The berries of *M. edule* are eatable, but not very good. Stove evergreens. Cuttings of shoots in sand, under a glass, in heat; loam and peat, with a good portion of sand, and pieces of charcoal. Winter temp., 50° to 55°; summer, 60° to 85°.

M. angulatum. 3. Purple. May. Mauritius. 1826.

— *capitellatum*. 4. July. E. Ind. 1796.

— *edule*. 10. Purple. Ceylon. 1820.

 — *polifolia*. Eng. Bot. ed. 3, t. 885, and its numerous varieties. See *Dubœccia polifolia*.

Mercury. (*Chenopodium bonus Henricus*.) This perennial plant is known by the various names of Angular-leaved Goosefoot, English Mercury, or Allgood, Good Henry, Good King Henry, and Wild Spinach. In many parts of Lincolnshire, as about Boston, it is cultivated for use as spinach; the young shoots are also peeled, boiled, and eaten as asparagus. Sow the seed in March—but in October is better—in a well-manured bed, prepared as for asparagus; in the middle of September plant the seedlings, during rainy weather, in a similar bed, in rows a foot apart each way. Hoe frequently, and use the shoots or to pass required. Dress the beds with manure

the same as for asparagus; they will continue in production many years.

This must not be mistaken for *Mercurialis*, or Dog's Mercury, one of our common hedge-weeds; for this is poisonous. *Mercurialis* is a diœcious plant, and belongs to the Nat. ord., *Euphorbiaceæ*; but the *Chenopodium* belongs to the Nat. ord., *Chenopodiaceæ*.

Merende'ra. (From the Spanish name for Colchicum. Nat. ord., *Liliaceæ*; Tribe, *Colchiceæ*.)

Hardy bulbs. Culture the same as for COLCHICUM.

M. Aitchesonii. See *M. persica*.

— *Bulbocodium* des. Pale purple. October. Portugal. 1882.

— *Bulbocodium*. †. Rosy-lilac. Pyrenees and Spain. Syns., *Colchicum montanum* and *M. montana*.

— *Eichleri*. E. Caucasus. Gf. t. 952. Syn., *Bulbocodium Eichleri*.

— *ruthénica*. Bright carmine-purple. Transylvania. 1888. A synonym of *Bulbocodium vernum*, var. *versicolor*?

— *montana*. See *M. Bulbocodium*.

— *persica*. Pale lilac. November. India and Persia. 1872. Syns., *M. Aitchesonii*, B. M. t. 6012, *Bulbocodium Aitchesonii*, and *B. trigynum*.

Meriania. (In memory of a Dutch lady, *Sibylle de Merian*, authoress of a work on Surinam insects. Nat. ord., *Melastomaceæ*; Tribe, *Merianeæ*.)

Stove shrub. For cultivation, see MELASTOMA.

M. Karsténii. Crimson. Caraccas. 1852. Fl. Ser. t. 767.

Me'ron Narc'issi. Syns., *M. clavipes* and *M. equestris*. Narcissus Fly. The bulbs of the daffodil and of other species of the narcissus frequently refuse to vegetate; and the usual cause is, that their interiors have been eaten by the grub of this two-winged fly. This disappointment may be avoided if these bulbs are examined before being planted.

In the month of November, says Mr. Curtis, one or two large, roundish holes are sometimes found on the outside of the bulbs of the daffodil and narcissus. The bulbs are more or less decayed within, where a maggot will generally be found, which, by feeding in the heart during the summer and autumn months, has been the sole author of the mischief. This larva is somewhat like the flesh-maggot, and not unlike a bot, only that it is not jagged with spines, and instead of being whitish, its natural colour, is changed to brown by its living amongst the slimy matter which has been discharged from its own body, causing the gradual rotting of the bulb. Towards the end of November the maggot is transformed into a pupa, to accomplish

which it eats its way out of the bulb near the roots, and buries itself in the surrounding earth. The pupæ are dull brown, egg-shaped, rough, and strongly wrinkled. In this state they remain until the following spring, when the flies issue from them. Their eggs are then deposited, but upon what part of the plant they are laid has not been observed, but probably upon the bulb near the base of the leaves. April seems to be the month when most of the flies hatch; and they have been compared to small humblebees, from the disposition of the colours, which are, for the most part, yellow, orange, and black; but they certainly bear a greater resemblance to some of the bot-flies. From bees they are readily distinguished by having only two wings, the horns and proboscis are totally different, and they have no stings.

Merte'nsia. (Named in honour of Professor Francis Charles Mertens, a German botanist. Nat. ord., *Boraginaceæ*; Tribe, *Borageæ*. Allied to *Pulmonaria*.)

Hardy herbaceous perennials, with handsome purplish-blue flowers. Seeds, or divisions of the plants in spring. Ordinary garden-soil. This must not be confounded with MERTENSIA of Willdenow (Nat. ord., *Filices*), which is now included in GLEICHENIA.

M. alpina. Blue. May. Rocky Mountains. 1875. *M. alpina* of B. M. t. 6178 is *M. lanceolata*.

— *dahurica*. †-1. Azure blue. June. Dahuria. Syn., *Pulmonaria dahurica*. B. M. t. 1743.

— *lanceolata*. †-1. Blue. May. Rocky Mountains. 1874. Syn., *M. alpina* of B. M. t. 6178.

— *maritima*. Blue. July. Coasts of Britain. Syn., *Pulmonaria maritima*. Oyster plant.

— *paniculata*. 1-2. Blue-purple. July. N. America. Syn., *Pulmonaria paniculata*. B. M. t. 2680.

— *sibirica*. Blue and white. Siberia and N. America. 1801.

— *virginica*. 1-2. Blue-purple. Spring. Virginia. 1799. Syn., *Pulmonaria virginica*. B. M. t. 160. Virginian Cowslip.

Mery'ta. (Derivation unexplained; perhaps from *meruo*, to wind, or roll up, Nat. ord., *Araliaceæ*.)

Stove evergreen shrubs, or small trees. For cultivation, see ARALIA.

M. latifolia. Yellow. Norfolk Island. 1835. Syn., *Botryodendron latifolium*.

— *sonchifolia*. New Caledonia. 1879.

Mesembry'anthemum. Fig-Marigold. (From *mesembria*, mid-day, and *antheum*, a flower; referring to the flowers opening better on sunny days. Nat. ord., *Ficoideæ*; Tribe, *Mesembryaceæ*.)

Greenhouse succulent plants, from South Africa, except when otherwise mentioned. All by seeds, and most of them by cuttings, dried at

the base, before inserting them in sandy soil, peat, loam, lime-rubbish, and old cow-dung, well-drained. Winter temp., 38° to 45°. Well suited for window-plants and rough rock-work, out of doors, in summer. Seeds should be sown in a hotbed, and plants gradually hardened off before planting out.

Messerschmi'dia. A synonym of *Tournefortia*.

Me'sua. (Named after *Mesue*, an Arabian botanist. Nat. ord., *Guttiferææ*; Tribe, *Calophyllææ*. Allied to *Calophyllum*.)

The sweet-scented flowers of *Me'sua ferrea* are sold in all the Indian bazaars, by the name of Nagksur, and are as much esteemed as orange flowers are with us. Stove evergreen tree. Seeds in a hotbed, in March; cuttings of half-ripened shoots in sand, under a bell-glass, in May, and with a little bottom-heat; loam and peat. Winter temp., 50° to 60°; summer, 60° to 85°.

M. ferrea. 40. White. July. E. Ind. 1837.

Metala'sia. (From *meta*, a change, and *lasios*, hairy; referring to the older leaves losing their downy covering. Nat. ord., *Compositææ*; Tribe, *Inuloideææ*. Allied to *Gnaphalium*.)

Greenhouse evergreens, from South Africa, with white flowers, except where otherwise stated. Cuttings in spring, in sandy peat; sandy peat, loam, and charcoal nodules, to keep the soil open. Winter temp., 40° to 48°.

- M. ai'rea*. Yellow. June. 1816.
 — *dive'rgens*. 2. July. 1816.

Metaste'lma. (From *mene*, the moon, and *stelma*, a crown; referring to the shape of the heads of flowers. Nat. ord., *Asclepiadaceææ*; Tribe, *Cynancheææ*.)

Stove evergreen twiner. Cuttings of the young shoots when three inches long, taken off close to the stem, in sand, under a glass, and in bottom-heat; peat and loam. Winter temp., 55° to 60°; summer, 60° to 80°.

M. parvifo'rum. 6. Green, white. W. Ind.

Metho'nica grandiflo'ra. B. M. t. 5216. See *Gloriosa superba*, var. *grandiflora*.

Metrodo'rea. (In memory of *Metrodorus Sabinus*, said to have been the

first draughtsman of plants. Nat. ord., *Rutaceæ*.)

Stove shrub. Cuttings under a bell-glass in heat. Light loam and peat. Summer temp., 60° to 85°; winter, 50° to 60°.

M. atropurpurea. 5. Purple. Mexico. 1851. Fl. Ser. t. 337.

Metroside'ros. (From *metra*, heart-wood, and *sideros*, iron; referring to the hardness of the wood. Nat. ord., *Myrtaceæ*; Tribe, *Leptospermeæ*. Allied to *Callistemon*.)

Greenhouse evergreens. Cuttings of small young side-shoots in April, in sand, under a bell-glass, in a close pit or frame, but without heat; peat and loam, equal proportions, with a little white sand and sifted, broken crocks. Winter temp., 35° to 45°. Most of them should be tried on a conservatory wall.

M. angustifolia. 20. Yellow. Cape of Good Hope. 1787.

— *anómala*. See *Angophora cordifolia*.

— *ve'ra*. 20. Yellow, green. April. E. Ind. 1819.

— *viridifolia*. B. M. t. 2602. See *Callistemon satignus*, var. *viridiflorus*.

Metro'xylon. (From *metra*, the heart of a tree, and *xylon*, wood. Nat. ord., *Palmææ*; Tribe, *Lepidocaryeæ*.)

Stove palms.

M. Ru'mphii. 50. Green. E. Indies. 1800.

Syns., *M. Sagus* and *Sagus Rumphii*.

— *vitie'nse*. Fiji Islands.

Metterni'chia. (In honour of the Austrian Prince Metternich-Winneburg. Nat. ord., *Solanaceæ*; Tribe, *Cestrineæ*.)

An evergreen stove shrub. For culture, see that of the evergreen species of *LISIANTHUS*.

M. prin'ceps. 3. White. August. Brazil. 1854. B. M. t. 4747. Syn., *M. princeps*.

Me'um. (From *meon*, a name used by Dioscorides. Nat. ord., *Umbelliferaæ*; Tribe, *Seselineæ*.)

Hardy perennial, propagated by divisions.

M. athama'nticum. 1-2. White. Britain. Eng. Bot. ed. 3, t. 606.

Mexican Lily. *Hippea'strum Regi'næ*.

Mexican Poppy. *Argemone*.

Mexican Tea. *Chenopo'dium ambrosioi'des*.

Mexican Thistle. *Cnicus consp'icuos*.

Mexican Tiger-flower. *Tigri'dia pavonia*.

Meye'nia. (In honour of M. Meyen, Nat. ord., *Acanthaceæ*; Tribe, *Thunbergieæ*.) See **Thunbergia**.

M. erecta. B. M. t. 5013. See *Thunbergia erecta*.

— *Hawtayne'na*. Maund Bot. t. 188. See *Thunbergia Hawtayneana*.

— *Vogelia'na*. B. M. t. 5389. See *Thunbergia Vogeliana*.

Meze'reon. *Da'phne Meze'reum*.

Mice. Various plans have been suggested to preserve peas and beans when sown from the ravages of mice. Dipping the seeds in oil, and then rolling them in powdered resin; putting small pieces of furze in the drills and over the rows after the seed has been sown, but before covering with the earth—were both partially successful; but the mode attended with the most complete safety has always been that of covering the surface of the soil over the rows, to the depth of full an inch, and six inches wide, with finely-sifted coal-ashes. The mice will not scratch through this; and it has the additional advantage, by its black colour absorbing the solar heat, of promoting the early vegetation of the crop.

Michaelmas Daisy. *A'ster*.

Michau'xia. (Named after A. Michaux, a French botanist. Nat. ord., *Campanulaceæ*; Tribe, *Campanuleæ*. Allied to *Campanula*.)

Hardy biennials. Seeds in the open border; in damp situations they are apt to fog off in winter; a dry, elevated situation is the best remedy; even there, in very severe weather, an evergreen branch stuck beside them will be an advantage.

M. campanuloi'des. 4. Pale red. July. Levant. 1787. B. M. t. 219.

— *deca'ndra*. 3. Light blue. July. Persia. 1829.

— *lævigata*. 3. White. July. Persia. 1827. B. M. t. 3123.

Miche'lia. (Named after P. A. Micheli, an Italian botanist. Nat. ord., *Magnoliaceæ*; Tribe, *Magnolieæ*.)

Stove evergreen tree. Cuttings of half-ripened shoots in summer, in sand, under a glass, and in heat; sandy loam and leaf-mould. Winter temp., 48° to 60°; summer, 60° to 85°.

M. champa'ca. 20. Yellow. E. Ind. 1779.

— *fusca'ta*. See *Magnolia fuscata*.

— *lanuginosa*. 12. Pale yellow. Himalayas. 1865. B. M. t. 6179.

Mico'nia. (Named after D. Micon, a Spanish botanist. Nat. ord., *Melast-*

tomaceæ; Tribe, *Miconiææ*. Allied to *Blakea*.)

Stove evergreens, with white flowers, unless otherwise specified. Cuttings of half-ripened shoots in sandy soil, under a bell-glass, and in heat; sandy peat and loam, with a few bits of cow-dung and charcoal. Winter temp., 48° to 60°; summer, 60° to 85°.

Micranthella. (From *mikros*, small, and *anthos*, a flower. Nat. ord., *Melastomaceæ*.) Now united with **Pleroma**.

Greenhouse shrub. For cultivation, see CHETOGASTRA.

M. Candolesi. Purple. Quito. 1864. A synonym of *Pleroma exappendiculata*.

Micranthemum. (From *mikros*, small, and *anthos*, a flower. Nat. ord., *Scrophulariaceæ*; Tribe, *Gratiolææ*.)

Evergreen perennial. Cuttings under a hand-light; division of the plant in spring; sandy peat, and a little loam; requires a pit or a dry, sheltered place in winter.

M. orbiculatum. $\frac{1}{2}$. White. May. Carolina. 1826.

Micranthus. (From *mikros*, small, and *anthos*, a flower. Nat. ord., *Iridææ*; Tribe, *Ixiææ*.) Sometimes regarded as a section of **Watsonia**.

For culture, see IXIA.

- M. cepa'ceus*. See *Watsonia spicata*.
 — *istulosus*. See *Watsonia istulosa*.
 — *plantagineus*. See *Watsonia plantaginea*.

Microca'chrys. (From *mikros*, small, and *kachrys*, a pine cone; the cones being very small. Nat. ord., *Conifereæ*; Tribe, *Podocarpeæ*.)

Greenhouse evergreen, allied to ARTHROTAXIS.
M. tetragona. 20. Tasmania. 1857. B. M. t. 5576.

Microcy'cas. (From *mikros*, small,

and *Cycas*, *Cycad.* Nat. ord., *Cycadaceæ*; Tribe, *Encephalarteeæ*.)

For culture, see MACROZAMIA.

M. calocoma. 2. Cuba. Syns., *Macrozamia calocoma* and *Zamia calocoma*.

Microga'ster. See **Ichneumon Flies**.

Microglo'ssa. (From *mikros*, small, and *glossa*, a tongue. Nat. ord., *Compositæ*; Tribe, *Asteroideæ*.)

Hardy shrub.

M. albescens. 2-4. Pale blue, yellow. Himalayas. 1842. B. M. t. 6672. Syn., *Aster cabulicus*.

Microle'pia. (From *mikros*, small, and *lepis*, a scale; the appearance of the spore, or seed-cases. Nat. ord., *Filices*.)

Now united with **Davallia**.

Stove ferns, with brown spores. See FERNS.

- M. ala'ta*. April. Jamaica.

Microl'icia. (From *mikros*, small, and *alkia*, stature; dwarf plants. Nat. ord., *Melastomaceæ*; Tribe, *Microlicieæ*. Allied to *Rhexia*.)

Stove plants, with purple flowers, in June. Seeds, divisions in spring, and cuttings of small young shoots of *recu'eva*, under a bell-glass, in heat; sandy peat, with pieces of charcoal and a few lumps of loam. Winter temp., 55° to 60°; summer, 60° to 85°.

- M. biva'vis*. $\frac{1}{2}$. Trinidad. 1822. Annual.
 — *brevifolia*. 1. Guiana. 1825. Annual.
 — *recu'eva*. 1. Trinidad. 1820. Herbaceous.

Microlo'ma. (From *mikros*, small, and *loma*, a fringe; flowers fringed. Nat. ord., *Asclepiadaceæ*; Tribe, *Cynancheæ*. Allied to *Asclepias*.)

Greenhouse evergreen twiner, from the Cape of Good Hope. Stiff little shoots, but young, as cuttings, in sand, under a bell-glass, in a close pit, in May; sandy loam, a little fibry peat, and dried leaf-mould. Winter temp., 40° to 50°.

- M. lineare*. 3. White. July. 1823. Syn., *Ceropegia sinuata*.
 — *sagittatum*. Green, purple. July. 1755. Syn., *Ceropegia sagittata*. Jacq. H. Schoenb. t. 38.

Microme'lum. (From *mikros*, small, and *melon*, apple. Nat. ord., *Rutaceæ*.)

Stove evergreen shrub. Sandy loam. Layers and cuttings.

M. pubescens. 4. White. June. W. Indies. 1823. Syn., *Bergera integerrima*.

Microme'ria. (From *mikros*, small, and *meris*, a part; referring to the flowers. Nat. ord., *Labiatae*; Tribe, *Satureineæ*. Allied to *Melissa*.)

Evergreen shrubs, with purple blossoms, except where otherwise specified. Cuttings under hand-lights in sandy soil, in a shady place, in May; common garden, light soil; a high, sheltered position, or the protection of a cold pit, in winter.

- M. approximata*. June. Mediterranean. 1822.

 — *varia*. July. Canaries. 1806.

Micromyrtus. (From *mikros*, small, and *Myrtus*; small Myrtles. Nat. ord., *Myrtaceæ*; Tribe, *Chamælauciceæ*.)

Small heath-like greenhouse shrub. Seeds in a hotbed in spring; cuttings of young shoots in May, in sand, in heat and under a bell-glass. Sandy loam and fibrous peat, well drained. Summer temp., 58° to 80°; winter, 40° to 55°.

M. microphylla. White. Australia. 1870.

Micropera. (From *mikros*, small, and *pera*, a pouch; the pouch-like labelum, or lip. Nat. ord., *Orchidææ*; Tribe, *Vandææ-Sarcantheæ*. Allied to *Saccolabium*.) United with **Sarcophilus** in the Genera Plantarum.

Stove orchids. The terrestrial species require to be grown in loose, open soil, in a pot; the others in a shallow basket, or on a moss-covered block of wood. Winter temp., 55°; summer, 60° to 85°.

TERRESTRIAL, OR GROUND.

- M. Ba'nksii*. New Zealand.
 — *meadia*. 2. Pale green, white. King George's Sound. 1823.

Mignonette. *Reseda odorata*.

Soil.—Light loam, well drained, and manured with leaf mould.

Sowing in the open ground, from the end of April to the beginning of July, will produce a sure succession of blooms through the year. If allowed to seed, and the soil suits it, mignonette will continue to propagate itself. If not allowed to ripen its seed, the same plants will bloom for two or more seasons, being a perennial in its native country.

For *Pot-Culture* and the production of flowers to succeed those of the open-ground plants, and to bloom in winter, sow once in August, and again in September. The soil as above, well drained, and pressed into 5-inch pots; cover the seed a fourth of an inch. Thin the seedlings to three in a pot. Water sparingly. When mignonette is deficient of perfume, it is because the temperature is too low.

Tree-Mignonette.—About the end of April is the best time to sow seeds for this purpose; and as the little tree of mignonette will be expected to last in good health for half a dozen years at least, lay a good foundation to begin with.

A rich compost of mellow loam, and one-third very rotten cow-dung, with a little sand ; and to keep this from getting too close, a handful of dry lime-mortar added to each pot of 6-inch diameter, and so in proportion for larger or smaller pots ; the mortar to be in lumps of the size of peas. Bones, charcoal, or even powdered crocks would answer the same purpose, only the mignonette is so much sweeter from the lime-rubbish or dry mortar. Cow-dung being very liable to turn sour, the mortar is a better corrector of this than even the charcoal. Take as many 3-inch pots as you want plants ; drain them with pieces of mortar, and over that a little of the roughest of your compost ; fill up nearly level with the top of the pot, and place three seeds in the very middle of each pot, and nine or ten seeds all over the surface ; if you just cover them with earth it is enough, and press them down very tight. Water them, and put them up in the window, or greenhouse, and if the seeds are good they will be up in less than ten days ; give them abundance of air, and no forcing. When the day is at all fine, put them outside the window from ten to three in the afternoon. They will not stand much water ; a gentle shower with a rose would suit them very well, and the best time to give it them is in the morning, when you turn them outside, as they will have time to drain and dry properly before you take them in for the night. If the three seeds in the centre come up, the weakest of the three must be pulled out as soon as you can get hold of it ; the rest to be thinned one-half. The reason for sowing so many seeds in one pot, and for thus thinning them out afterwards, is to make sure of one good plant ; if the middle one turns out to be so, that must be selected ; but if not, you must choose the strongest and most promising from among the rest ; yet be in no great hurry to pull them all out but one ; so long as three or four have room, leave them. When you have fixed on the one that is to form the future tree, place a neat little stick down by the side of it, a foot long, and pushed down to the bottom of the pot. When the plant is two inches long, tie it loosely to this stick with a piece of worsted thread. Keep tying it as regularly as it grows, and when it reaches the top of the stick give it a longer one, that is, if you wish a long stem. Some people grow them up to three, or even four, feet and more. Suppose we say only a foot high for a couple of them, as they must all go in pairs ; eighteen inches for the next couple, and two feet for a third lot ; you

would then be better able to judge which size would suit your window best ; and as soon and as often as side-branches issue forth from the stem of your tree, you must stop them at the second joint. Some people, who do not know the value of leaves, cut off the side-shoots close to the stem at once ; but the substance of the stems and trunks of all trees, and mignonette-trees among the rest, is first formed by the leaves. In the second year you will cut off more than the half of these side-spurs, beginning at the bottom, and only taking off a pair at a time, and in ten days or a fortnight another couple, and so on progressively.

There must be no flowers the first season, at least as long as there are some out in the borders. After the middle of October you may let your trees bloom all the winter, but before that nip them off as fast as they appear. When the first little pots are full of roots, say about Midsummer, shift the plants into 5-inch pots, which is the next largest size ; and if they have done well they may want another shift by the end of July, but never shift them after the middle of August, because, if we should have a cold autumn, they would not fill the pots with strong, healthy roots.

Mika'nia. (Named after *J. Mikan*, professor of botany at Prague. Nat. ord., *Compositæ* ; Tribe, *Eupatoriaceæ*. Allied to *Eupatorium*.)

Stove evergreen twiners, with white flowers, blooming in August, except where otherwise mentioned. Cuttings of half-ripened shoots in sand, under a bell-glass, and in heat ; rich, sandy loam. Winter temp., 48° to 55° ; summer, 60° to 80°.

Mildew, whether on the stems of the wheat, or on the leaves of the chrysanthemum, pea, rose, or peach, appears in the form of minute fungi, the filaments or hyphæ of which penetrate the pores of the epidermis, rob the plant of its juices, and interrupt its respiration. Every specimen of these fungi emits annually myriads of minute spores, and these are wafted over the soil by every wind, vegetating and reproducing the fungi, if they have happened to be deposited in a favourable place, or remaining until the following spring without germinating. These fungi have the power of spreading also by stooling, or throwing out offsets. They are rarely absent from a soil, and at some period

of its growth are annually to be found upon the plants liable to their inroads. They are more observed in cold, damp, muggy seasons, because such seasons are peculiarly favourable to the growth of all fungi. The best of all cures is afforded by the application of flowers of sulphur in some form, either by dusting the sulphur over the parts affected, or a sulphur paint, for which a recipe is given at page 238; merely clay, water, and flowers of sulphur, however, are sufficient, and not so injurious to leaves. *Uredo rosæ*, *Puccinia rosæ*, and *Cladosporium herbarum* are the mildew fungi of the rose-tree; *Oidium erysiphoides*, of the peach-tree; *Oidium Tuckeri*, of the vine; *Glaeosporium concentricum*, of the cabbage; and *Erysiphe communis*, of the pea. Of course there are many others.

The most important point for subduing the mildew fungus is to apply the sulphur immediately it appears. To prevent its occurrence, nothing is so effectual as keeping the roots and the leaves equally active by a due amount of warmth and moisture.

Milfoil. *Achille'a*.

Milk-Vetch. *Astragalus*.

Milk-Wood. *Brosimum spurium*.

Milkwort. *Polygala*.

Milla. (Named after *J. Milla*, a gardener to the Spanish court. Nat. ord., *Liliaceæ*; Tribe, *Alliaceæ*. Allied to *Caloscordium*.)

Half-bardy little bulbs with white flowers, which succeed in a deep, front border of light soil; offsets when in a dormant state.

M. biflora. 1½. May. Mexico. 1826. B. R. t. 1555.

Mime'tes. (From *mimos*, a mimic; referring to its resemblance to allied genera. Nat. ord., *Proteaceæ*. Allied to *Leucospermum*.)

Greenhouse evergreen shrubs, from South Africa. Cuttings of the ripened shoots towards autumn, or in the spring, before fresh growth commences, in sand, under a glass, but without bottom-heat, at least until a swelling takes place at their base; peat and a little loam. Winter temp., 38° to 45°.

- M. capitulata*. Red. June. 1822.

Mimo'sa. (From *mimos*, a mimic; referring to the irritability of the leaves, as if imitating animal sensibility. Nat. ord., *Leguminosæ*; Tribe, *Eumimosæ*.)

Stove evergreens, except *pubiflora*, commonly called the Sensitive Plant, which is an annual, and *vi'va*, which is herbaceous. Seeds sown in a hotbed, in the spring; cuttings also of young shoots, getting rather firm at the base, in sandy soil, and in heat; sandy loam, leaf-mould, and a little peat. Winter temp., 60° to 65°; summer, 60° to 85°. The foliage of most is beautifully leafleted, and many species more or less sensitive to the touch; most of them furnish fine examples of what is termed *sleep* in plants, as the leaflets fold together at night.

Mischa'nthus. (From *miskos*, a stem, and *anthos*, a flower; referring to the tall stems. Nat. ord., *Gramineæ*.)

A tall graceful grass.

M. sine'nsis. E. Asia. Syn., *Eulalia japonica*.

Mistletoe. (*Viscum album*.) Name derived from the Saxon for the same plant, *Miselta*. The best months for sowing it are February and March. Make two cuts in the shape of the letter V, on the under-side of the branch of an apple-tree. Make the cuts quite down to the wood of the branch; raise the tongue of the bark made by the cuts, but not so as to break it, and put underneath one or two seeds freshly squeezed from the Mistletoe berry. Let the tongue back into its place, and the process is completed. If the seed is good, the seedlings, not unlike cucumber plants, soon appear. They remain attached to the branch, and do not seem to injure the tree.

Open the bark underneath the branch to receive the seed, because it is thus preserved from an accumulation of rain water, and is shaded from the sun.

The Mistletoe may also be propagated by grafts; and it is said that it will succeed upon any tree. It is certainly found upon the pine in Germany; but we question very much whether it would live upon the walnut. It will grow, yet with difficulty, upon the oak; but it readily takes upon the apple, pear, poplar, and willow. Mr. Beaton says ("Gard. Mag." iii. 207, N.S.), the first weeks of May are best for grafting the Mistletoe, and it should never be inserted less than five nor more than ten feet from the ground. Make an incision in the bark of the tree, and insert into it a thin slice of Mistletoe, having a bud and one leaf at the end. Grafts larger than half an inch in diameter require a notch to be cut out of the branch, the incision to receive the

scion being made below this notch, and a shoulder left on the scion to rest on the notch, as in crown-grafting. Budding the Mistletoe may also be practised in the middle of May. Mr. Beaton says it is only a modification of grafting, a heel of wood being retained below the bud for insertion.

Mitche'lla. (Named after *Dr. Mitchell*, of Virginia. Nat. ord., *Rubiaceæ*; Tribe, *Anthospermeæ*.)

Hardy herbaceous creeper. Division, cuttings under a hand-light, and layering the running stems; sandy, fibry peat, either in a sheltered American border, or in a pot protected like the generality of alpine plants.

M. repens. †. White. June. N. Amer. 1731. B. C. t. 979.

Mite. See **Acarus**.

Mite'la. (The diminutive of *mitra*, a mitre; referring to the shape of the seed-pods. Nat. ord., *Saxifragaceæ*; Tribe, *Saxifrageæ*. Allied to *Heuchera*.)

Hardy, white-flowered, herbaceous perennials, from North America. Division of the roots in spring; common garden-soil. Pretty for border or rock-work.

M. cordifolia. †. May. 1812.
— *diphylla*. †. April. 1731.
— *nuda*. †. July. 1758. Syn., *M. reniformis*.
— *pentandra*. †. Yellow. June. 1827. B. M. t. 2933. Syn., *Drummondia nitelloides*.
— *prostrata*. †. May. 1818.
— *reniformis*. See *M. nuda*.
— *trifida*. †. May. 1827.

Mitraca'rpum. (From *mitra*, a mitre, and *karpos*, a fruit. Nat. ord., *Rubiaceæ*; Tribe, *Spermacoceæ*. Allied to *Richardsonia*.)

Stove annuals, with white flowers. Seeds in a hotbed, in March, potted and hardened off to bloom in the stove and greenhouse during the summer.

M. Fischeri. 1. July. Jamaica. 1821.
— *hirtum*. †. July. Jamaica. 1818. Syn., *Spermacoce hirta*. Jacq. Ic. t. 308.
— *stylosum*. 1. August. Manilla. 1819.
— *villosum*. †. July. Jamaica. 1816.

Mitra'ria. (From *mitra*, a mitre; referring to the seed-pod. Nat. ord., *Gesneraceæ*; Tribe, *Cyrtandreeæ*. Allied to *Columnea*.)

Evergreen shrub. Cuttings of the half-ripened shoots in sand, under a bell-glass, in summer; better-ripened shoots under a hand-light, in a shady place. A beautiful spring plant for the greenhouse, and supposed to be hardy enough for all sheltered places out of doors; sandy peat and fibry loam.

M. coccinea. 4. Scarlet. July. San Carlo de Chiloe. 1848. B. M. t. 4462.

Mitriosti'gma. (From *mitra*, a mitre, and *stigma*; referring to the shape of the stigma. Nat. ord., *Rubiaceæ*; Tribe, *Gardenieæ*.)

Stove shrub. For culture, see **GARDENIA**.

M. axillare. 5. White; fragrant. Spring. Natal. Syn., *Gardenia citriodora*. B. M. t. 4937.

Mixture of Soils is one of the most ready and cheapest modes of improving their staple, and thus rendering them more fertile; and upon this subject we have nothing to add to the following excellent remarks of Mr. Cuthbert Johnson:

"I have witnessed, even in soils to all appearance similar in composition, some very extraordinary results from their mere mixture. Thus, in the gravelly soils of Spring Park, near Croydon, the ground is often excavated to a depth of many feet, through strata of barren gravel and red sand, for the purpose of obtaining the white or silver sand which exists beneath them. When this fine sand is removed, the gravel and red sand are thrown back into the pit, the ground merely levelled, and then either let to cottagers for gardens, or planted with forest trees. In either case the effect is remarkable, all kinds of either fir or deciduous trees will now vegetate with increased luxuriance; and in the cottage-gardens thus formed, several species of vegetables, such as beans and potatoes, will produce very excellent crops, in the very soils in which they would have perished previous to their mixture. The permanent advantage of mixing soils, too, is not confined to merely those entirely of an earthy composition: earths which contain inert organic matter, such as peat or moss earth, are highly valuable additions to some soils. Thus, peat earth was successfully added to the sandy soils of Merionethshire by Sir Robert Vaughan. The Cheshire farmers add a mixture of moss and calcareous earth to their tight-bound earths, the effect of which they describe as having 'a loosening operation;' that is, it renders the soil of their strong clays less tenacious, and, consequently, promotes the ready access to the moisture and gases of the atmosphere to the roots. The cultivator sometimes deludes himself with the conclusion that applying sand, or marl, or clay, to a poor soil, merely serves to freshen it for a time, and that the effects of such applications are apparent for only a limited period. Some comparative experiments, however, which were made sixteen years since, on some poor, hungry heath-land, in Norfolk, have up to this time served to demonstrate the error of such a conclusion. In these experiments the ground was marled with twenty cubic yards only per acre, and the same compost; it was then planted with a proper mixture of forest trees, and by the side of it a portion of the heath, in a state of nature,

was also planted with the same mixture of deciduous and fir-trees.

"Sixteen years have annually served to demonstrate, by the luxuriance of the marled wood, the permanent effect produced by a mixture of soils. The growth of the trees has been there rapid and permanent; but on the adjoining soil the trees have been stunted in their growth, miserable in appearance, and profitless to their owner.

"Another, but the least commonly practised mode of improving the staple of a soil by earthy addition, is claying; a system of fertilizing, the good effects of which are much less immediately apparent than chalking, and hence one of the chief causes of its disuse. It requires some little time to elapse, and some stirring of the soil, before the clay is so well mixed with a sandy soil as to produce that general increased attraction and retentive power for the atmospheric moisture, which ever constitutes the chief good result of claying poor soils. Clay must be, moreover, applied in rather larger proportions to the soil than chalk; for not only is its application rarely required as a direct food for plants for the mere alumina which it contains, since this earth enters into the composition of plants in very small proportion, but there is also another reason for a more liberal addition of clay being required, which is the impure state in which the alumina exists in what are commonly called clay soils."—*Farm Encyc.*

Mode'cca. (The Indian name. Nat. ord., *Passifloræ*; Tribe, *Modeceæ*. Allied to *Carica*.)

Stove evergreen climbing plants, resembling Passion-flowers. Cuttings of young shoots in May, in sandy soil, under a bell-glass, and in heat; peat and loam. Winter temp., 48° to 55°; summer, 60° to 75°.

M. lobata. B. R. t. 433. Yellowish-green. Sierra Leone.

— *trilobata*. 10. August. E. Indies. 1818.

— *tuberosa*. 10. August. E. Indies. 1822.

Modi'ola. (From *modiolus*, the nave of a wheel; referring to the formation of the seed-vessel. Nat. ord., *Malvaceæ*; Tribe, *Malveæ*. Allied to the Mallow.)

Seeds in spring; division of the two herbaceous kinds at the same time, and by cuttings of the young shoots under a hand-light; common, sandy loam. The herbaceous require a dry, sheltered place, or the protection of a cold pit during the winter.

M. caroliniana. Red. June. N. Amer. 1723. Hardy annual. Syn., *Sphæralcea caroliniana*.

— *decumbens*. Red. June. S. Amer. 1815. Half-hardy herbaceous. Syn., *Sphæralcea decumbens*.

— *geranioides*. Rosy-lilac. Garden, Jan. 28, 1822.

M. prostrata. Scarlet. May. Brazil. 1806. Half-hardy herbaceous. Syn., *Sphæralcea prostrata*.

Moerhingia. (Named after P. Moerhing, a German botanist. Nat. ord., *Caryophyllaceæ*.) United with **Arenaria** in the Genera Plantarum.

Hardy herbaceous perennials, from the south of Europe. Division of the plant in spring; common, sandy soil, and dry, elevated positions; suited for steep rock-works.

M. muscosa. †. Purple. June. 1775.

— *sedifolia*. †. White, red. June. 1823.

Mogi'phanes. (From *mogis*, scarcely, and *phainein*, to show; the flowers are small. Nat. ord., *Amaranthaceæ*; Tribe, *Gomphreneæ*.)

Stove plant.

M. straminea. Syn., *Gomphrena brasiliensis*. Jacq. Ic. t. 346.

Moh'ria. (Named after M. Mohr, a German botanist. Nat. ord., *Filices*.)

Greenhouse fern. See FERNS.

M. thurifraga. Brown, yellow. June. Cape of Good Hope. 1842.

Moist Stove. A stove with a moist atmosphere. See **Stove**.

Moldavian Palm. *Dracoc'phalum moldavicum*.

Moldenhau'era. (Named after I. J. Moldenhauer, a German botanist. Nat. ord., *Leguminosæ*; Tribe, *Eucæsalpineæ*. Allied to *Swartzia*.)

Stove evergreen shrub. Cuttings of ripened shoots in sand, under a glass, in heat; rich sandy loam. Winter temp., 50° to 55°; summer, 60° to 75°.

M. floribunda. Yellow. May. Brazil. 1828.

Mole Cricket. One of the most curious, and often most destructive to our kitchen-garden crops of all the subterranean vermin, is the Mole-cricket, known, in different parts of England, by the various names of Earth-crab, Jarr-worm, Churr-worm, and Eve-churr. It is the *Gryllotalpa vulgaris* and *europæa* of some naturalists, and in the *Gryllus gryllotalpa* of others. It rarely appears upon the surface of the soil, but makes burrows, like the mole, and destroys all roots which interrupt him in forming these passages. When full-grown, it is nearly two inches long, and four lines broad; colour, dark brown; antennæ, bristle-shaped, and in front of its black eyes; thorax, hairy; wings, broad, large, and triangular when fully opened; abdomen, nine or ten jointed, furnished at the end with two hairy, awl-shaped filaments. The two fore-feet are broad, like those of the mole, and similarly intended for digging. The female hollows out a place, about half a foot from the surface, in the month of June, and lays her eggs

in a heap, from two to three hundred. They are shining yellowish-brown, and like grains of millet. The young, which are hatched in July or August, greatly resemble black ants, and feed, like the old ones, on the tender roots of grass, corn, and various culinary vegetables. They betray their presence under the earth by the withered decay of culinary vegetables in the garden. In October and November they bury themselves deeper in the earth, as a protection from cold, and come again to the surface in the warmer days in March. Their presence is discovered by their throwing up the earth like moles. The surest of remedies is destroying the brood in June or July. Gardeners know, from experience, where the nest of the Mole-cricket is situated; they dig it out with their spades, and destroy hundreds in the egg state with little trouble.—*Kollar.*

Molinia. (After *J. Molini*, a writer on Chilian plants. Nat. ord., *Gramineæ*.)

Hardy, perennial grass.

- M. Bertini.* A seedling variegated variety of *M. cœrulea*. 1890.
— *cœrulea*. 1-3. Purple or green. July. Britain. Eng. Bot. ed. 3, t. 1747.
— — *variegata*. Variegated variety.

Molopospermum. (From *molops*, a stripe, and *sperma*, a seed; the fruit is striped. Nat. ord., *Umbelliferae*.)

Hardy fern-like perennial. Divisions, seeds. *M. cicutarium*. 3-5. Yellowish. May. Mountains of S. and Central Europe. 1596.

Moltkia. (Named after *Count Moltke*, a Danish noble. Nat. ord., *Boraginæ*; Tribe, *Boragææ*. Allied to *Echium*.)

Hardy herbaceous perennial. Division of the plant in spring; rich, sandy loam.

- M. cœrulea*. 1. Blue. April. Persia. 1829.
— *petraea*. †. Blue. June. S. Europe. 1843. Syns., *Echium petraeum* and *Lithospermum petraeum*. B. M. t. 5942.

Molucella. *Molucca Balm.* (From *Molucca*, where the plants were supposed to be natives. Nat. ord., *Labiatae*; Tribe, *Stachydeæ*. Allied to *Phlomis*.)

Hardy plants, with purple flowers, flowering in July. *Tuberosa*, by dividing the tubers in spring and autumn. This, and also the others, which are annuals, by seed in a hotbed, in spring; potted, barded off, and transferred to the flower-border in the middle of May; sandy loam. *M. laevis*. 1‡. Syria. 1570. B. M. t. 1852.
— *Marrubium strum*. 1. Syria. 1820.
— *tuberosa*. 2. Tartary. 1796.

Moly. *Allium moly*.

Momo'dica. (From *mordeo*, to bite; alluding to the jagged seeds. Nat. ord., *Cucurbitaceæ*; Tribe, *Cucumérineæ*.)

Stove climbers, raised annually from seed, like the MELON, which see for raising young plants.

- M. balsamea*. Yellow. July. E. Indies. 1568. Balsam apple.
— *Charantia*. Yellow. July. E. Indies. 1710.
— *Elaterium*. See *Ecbalium Elaterium*.

— *Russelliana*. 2. White. September. 1823. B. M. t. 2513.

Monarde'lla. (A diminutive of *Monarda*. Nat. ord., *Labiatae*; Tribe, *Satureineæ*. Allied to *Origanum*.)

Hardy herbaceous perennial. Division of the plant in spring; common, sandy soil, with a little peat or leaf-mould.

- M. caudicans*. 1. White. California. 1853.
— *macrantha*. Scarlet. Autumn. California. 1877. B. M. t. 6270.
— *undulata*. †. Violet. June. California. 1843.

Mone'ses. (From *monos*, single, and *esis*, delight; the flowers are solitary. Nat. ord., *Ericaceæ*.)

Hardy perennial herb.

- M. uniflora*. White or pink. June. Britain to Japan. Syn., *Pyrola uniflora*. Eng. Bot. ed. 3, t. 900.

Monetia. (Named after *Monet de la Marek*, a French botanist. Nat. ord., *Ilicineæ*. Allied to *Prinos*.)

Stove evergreen shrub. Cuttings of half-ripened shoots in sand, under a bell-glass, and in a mild bottom-heat; sandy loam, and a little fibry peat. Winter temp., 48° to 55°; summer, 60° to 80°.

M. barlerioi des. 3. Green. July. E. Ind. 1758.

Moneywort. *Lysimachia nummularia*.

Monizia. (In honour of *J. M. Moniz*, a botanist in Madeira. Nat. ord., *Umbelliferae*.)

Greenhouse evergreen shrub.

M. edu'lis. 4. May. Madeira. 1857. The roots are eaten in Madeira.

Monkey-Bread. *Adansonia*.

Monkey-Flower. *Mimulus*.

Monkey-Nut. *A'rachis hypogæa*.

Monk's Hood. *Aconitum*.

Monnina. (Named after *Monnino*, Count de Flora Blanca, a Spanish patron of botany. Nat. ord., *Polygalaceæ*. Allied to *Muraltia*.)

The bark of the root is used in Peru for soap, and the Peruvian ladies ascribe the beauty of their hair to the use of it. Greenhouse evergreen shrubs. Seeds in March, in a gentle hotbed; cuttings of young side-shoots in April, under a bell-glass, and kept close, but damp prevented; sandy peat and fibry loam. Winter temp., 40° to 45°.

M. rotarioides. 2. Purple. August. 1840.

— *obtusifolia*. 12. Violet and white. June. Peru. 1830. B. M. t. 3122.

— *zalapeensis*. Blue, yellow. Mexico. 1879.

Mono'cera grandiflora, B. M. t. 4680, and *M. lanceolata* are synonyms of **Elæocarpus grandiflorus**.

Monochæ'tum. (From *monos*, one, and *chaite*, a bristle. Nat. ord., *Melastomaceæ*; Tribe, *Rhexiææ*.)

Stove evergreen shrubs. Cuttings in sandy peat. Sandy peat and loam. Summer temp., 60° to 80°; winter, 45° to 60°.

M. alpe'stre. Bright red. Mexico.

— *dicranantherum*. See *M. Hartwegianum*.

— *ensiferum*. Purple. Mexico.

— *Hartwegianum*. Rose. Winter. Peru. 1865.

Syn., *M. dicranantherum*. B. M. t. 5506.

— *Humboldtianum*. Purplish rose. November. Caracas. 1863. B. M. t. 5367.

— *Lemoinia*'num. Deep violet-rose. Winter.

— *nitidum*. Pink. New Grenada.

— *sericeum*. Pink. New Grenada. 1859. There is a variety called *multiflorum*.

— *tene'vum*. 1½. Purple. Guatemala.

Monochi'lus. (From *monos*, one, and *cheilos*, a lip; the formation of the flower. Nat. ord., *Verbenaceæ*; Tribe, *Verbeneæ*. Allied to *Verbena*.)

Stove tuber. Division of the tubers when in a dormant state; sandy loam, a little fibry peat, and leaf-mould. Temp. when growing, 55° to 75°.

M. glazini'folius. White. Brazil. 1838.

Monocho'ria. (From *monos*, one, and *chorizo*, to separate; one stamen, does not resemble the rest. Nat. ord., *Pontederiaceæ*.)

Stove aquatic herbs. For culture, see **PONTEDERIA**.

M. cya'nea. Blue. 1833.

— *hastata*. 2. Blue. July. E. Indies. 1806. Syn., *Pontederia dilatata*. Andr. Rep. t. 490.

— *vagina*'tis. 2. Blue. Summer. E. Asia.

— *Korsakovii*. 1. Violet. Summer. 1862.

Monocotyledons, or **Endogens**, form one of the great classes into which flowering plants are divided. Their characteristics are:—vascular bundles isolated, the stem increasing in thickness by new bundles being developed between the older ones, and thus the wood does not form concentric rings; veins of the leaves more or less parallel; parts of the flower in threes, or some multiple of that number; embryo with one seed leaf. This class furnishes a very large proportion of the handsome plants now in cultivation, e.g., those belonging to the orders *Orchidææ* (*Orchids*), *Irideææ* (*Iris*, *Crocus*), *Amaryllidæææ* (*Narcissus*, *Crinum*), *Liliaceæææ* (*Lilies*, *Tulips*, *Hyacinths*), *Gramineæææ* (*Grasses*), etc.

Monogra'mma. (From *monos*, one, and *gramma*, writing; referring to the spore, or seed-cases. Nat. ord., *Filices*.)

Stove ferns, from the West Indies, with brownish-yellow spores. See **FERNS**.

M. furcata. June. 1825.

— *graminea*. June. 1830.

— *trichodea*. June.

Monole'na. (From *monos*, one, and *olene*, the arm; alluding to the arm or process from the base of the anther. Nat. ord., *Melastomaceæ*; Tribe, *Sone'riteææ*.)

Stove perennials. Sandy loam and peat, or leaf-mould. Moist atmosphere. Summer temp., 75° to 85°; winter, 60° to 65°.

M. primulaeflora. ½. Bright pink. November. Columbia. 1869. Syn., *Bertonia primulaeflora*.

Monolo'phus. (From *monos*, one, and *lophos*, a crest. Nat. ord., *Scitamineæææ*; Tribe, *Zingiberæææ*.) A synonym of **Kæmpferia**.

M. secun'da. See *Kæmpferia secunda*. B. M. t. 6999.

Monolo'pia. (From *monolopus*, one covering; referring to the flower-covering. Nat. ord., *Compositæææ*; Tribe, *Hel'enioidæææ*. Allied to *Lasthenia*.)

A pretty, hardy annual, once called *Hel'nium Douglasii*. Seeds in mellow soil, in April.

M. ma'jor. 3. Yellow. July. California. 1834. B. M. t. 3839.

Monomeria. (From *monos*, one, and *meris*, a part. Nat. ord., *Orchideæ*; Tribe, *Epidendreae-Dendrobiceæ*. Allied to *Bulbophyllum*.)

Stove orchids. Division in spring or autumn; fibry peat, broken pots, and sphagnum. Winter temp., 55° to 60°; summer, 60° to 90°.

M. barbatata. Spotted. India. 1841.

— *nivida*. Mexico. 1841.

Monopanax. (A name compounded of *monos*, one, and *Panax*; from the ovary being one-celled, and the plant resembling a *Panax*. Nat. ord., *Araliaceæ*.)

Stove evergreen tree. For cultivation, see ARALIA.

M. Gheisbreghtii. Greenish-white. Mexico. 1869. Syn., *Aratia Gheisbreghtii*.

Monopsis. (From *monos*, one, and *opsis*, a face; the flowers being more regular than is usual in the Nat. ord., *Campanulaceæ*; Tribe, *Lobeliaceæ*.) Regarded as a section of *Lobelia* in the *Genera Plantarum*.

A pretty little annual. Seeds in a hotbed, in March; plants pricked off, hardened off, and transferred to the open border at the end of May.

M. conspicua. $\frac{1}{2}$. Blue. July. Cape of Good Hope. 1812. Syn., *Lobelia speculum*.

Monopyle. (From *monos*, one, and *pyle*, a door; because the capsule opens by one dorsal slit. Nat. ord., *Gesneraceæ*; Tribe, *Gesneraceæ*. Allied to *Gloxinia*.)

M. racemosa. White. July. Columbia. 1875.

Monotoca. (From *monos*, one, and *tokos*, a birth; the fruit, which is eatable, having only one seed. Nat. ord., *Epacridaceæ*; Tribe, *Stypheliaceæ*. Allied to *Leucopogon*.)

Greenhouse white-flowered evergreens, from New South Wales. Cuttings of the points of young shoots in sand, over sandy soil, and covered with a bell-glass, in May; sandy peat, and a little fibry loam. Winter temp., 40° to 48°.

M. alba. 6. June. 1824.

— *elliptica*. 8. June. 1802.

— *lineata*. 6. June. 1804.

— *scoparia*. 5. June. 1825.

Monsonia. (Named after *Lady A. Monson*. Nat. ord., *Geraniaceæ*; Tribe, *Geraniaceæ*. Allied to *Geranium*.)

Greenhouse herbaceous perennials, except *ovata*, which is biennial. All from South Africa. Seeds in a slight hotbed, in spring, and transplanted; cuttings in spring and autumn, under a hand-light; division and cuttings of the roots in summer and autumn; sandy loam, and a little peat and leaf-mould; a cold pit or greenhouse in winter.

M. biflora. 1. Lilac-blue. S. Africa. 1869.

— *Heritieri*. 1. Purple. May. 1790. Syn., *Sarcocaulon Heritieri*.

— *lobata*. 1. Purple. May. 1774. B. M. t. 385.

— *ovata*. 1. White. August. 1774.

M. Patersonii. $\frac{1}{2}$. Purple. May. 1827. Syn., *Sarcocaulon Patersonii*.

— *pilosula*. 1. White. July. 1778. B. M. t. 35.

— *CoUea*. 1. Pale red. July. 1820.

— *speciosa*. 1. Red. May. 1774. B. M. t. 73.

— *paUida*. 1. Pale red. May.

Monstera. (Derivation unexplained. Nat. ord., *Aroidæ*; Tribe, *Calleeæ*. Allied to *Raphidophora*.)

Stove evergreen climbers. For cultivation, see PHILODENDRON.

M. Adamsonia. Yellow. May. W. Indies.

1752. B. M. t. 5086.

— *cannaeifolia*. See *Spathiphyllum*.

— *deltoidea*. Mexico. Syn., *Tornelia fragrans*.

— *lingulata*. W. Indies. 1793.

— *peruviana*. Yellow. S. America. 1752. Syn.,

Calla pertusa and *Dracontium pertusum*.

Montagnea. See **Montanoa**.

Montanoa. (After *Montano*, a Mexican politician. Nat. ord., *Compositæ*; Tribe, *Helianthoideæ*. Syn., *Eriocarpha*, *Eriocoma*, and *Montagnea*.)

Cool greenhouse shrubs. By seeds, in spring, in a gentle bottom-heat; by cuttings in autumn.

M. bipinnatifida. 6-8. Yellow. Mexico. Syn.,

M. heracleifolia, *Polymnia grandis*, and *P. heracleifolia*.

— *heracleifolia*. See *M. bipinnatifida*.

— *mollissima*. Yellow, white. Autumn.

Mexico.

— *tomentosa*. 3. White. September. Mexico.

1828. Syn., *Eriocoma fragrans*, Swt. Fl. Gard. ser. 2, t. 44.

Montbretia. (In honour of *M. Montbret*. Nat. ord., *Iridæ*; Tribe, *Ixieæ*.) Sometimes united with **Tritonia**.

Little *Ixia*-looking bulbs, with yellow flowers, from the Cape of Good Hope. Offsets; sandy loam, with a little peat or leaf-mould; if not protected on a warm border, should be kept during winter in a cold pit.

M. crocosmæiflora. Hybrid between *M. Pottsii* and *Crocosma aurea*.

— *flexuosa*. May. 1803.

— *Pottsii*. 3-4. Orange-scarlet. 1877. Hardy.

— *virgata*. May. 1825.

Montezuma. (Named after a king of Mexico. Nat. ord., *Malvaceæ*; Tribe, *Bombacææ*. Allied to *Cheirostemon*.)

Stove evergreen tree. Cuttings of shoots, getting firm, in sand, under a glass, and in bottom-heat; sandy loam and lumpy peat. Winter temp., 48° to 55°; summer, 60° to 80°.

M. speciosissima. 30. Red. Mexico. 1827.

Montrichardia. (In honour of *Gabriel Montrichard* of Trinidad. Nat. ord., *Aroidæ*; Tribe, *Philodendreae*.)

Stove aquatic or marsh plants, with trunk-like stems and large sagittate leaves, very remarkable. Seeds; division of rootstock. Rich loam under water. Moist atmosphere. Summer temp., 80° to 90°; winter, 60° to 65°.

M. linnæana. 6-12. Green, cream colour. Bahia. 1860.

Moon-Creeper. *Ipomæa bonoi*

noxa.

Moon-Seed. *Menispermum*.

Moon-Trefoil. *Medicago arborescens*.

Moonwort. *Botrychium*.

Moo'rea. (After *F. W. Moore*, Curator of the Glasnevin Botanic Garden. Nat. ord., *Orchidææ*; Tribe, *Vandææ-Stanhopeææ*.)

Stove orchid. For culture, see HOULETIA.

M. irrorata. 1½. Reddish-brown, G. C. 1890, viii. p. 7. B. M. t. 7262.

Moræ'a. (Named after *R. Moore*, an English botanist. Nat. ord., *Iridææ*; Tribe, *Moræææ*. Allied to *Iris*.)

These pretty bulbs, all from South Africa, except where otherwise mentioned, require the same treatment as *IXIA*, which see.

M. angustata. ¾. Lilac. May. 1790. B. M. t. 1276.

— *barbifera*. ¼. Purple. May. 1587.

Mo'rna. (Named after *Morna*, one of Ossian's heroines. Nat. ord., *Compositæ*. Allied to *Podolopsis*.) United in the Genera *Plantarum* with **Waitzia**.

Greenhouse plants, with yellow flowers, from Swan River. *Nitida*, an evergreen, may be propagated by cuttings under a bell-glass; and both are easily raised from seed, sown either in September or March; but in both cases the plants must be kept in light soil, and well drained, or they will damp off. The autumn-sown ones will bloom in the greenhouse early in spring and summer; the spring-sown ones late in summer, and the beginning of autumn. If it is desirable to try them out of doors, they should

not be planted out beyond the north of London until the middle of June.

M. nitida. 2. February. 1835. B. R. t. 1941.

— *nitida*. 1½. July. 1836. B. R. 1838, t. 9.

Morning Glory. *Ipomœa*.

Morono'bea. Hog Gum Tree. (From *moronobo*, the native name. Nat. ord., *Guttiferae*; Tribe, *Morono-beæ*.)

Stove evergreen tree. Cuttings of the ripened shoots, with all the leaves except those at the lower joint, in sand, in heat, and under a bell-glass; sandy loam, and lumpy, dried leaf-mould. Winter temp., 50° to 55°; summer, 60° to 85°.

M. coccinea. 40. Scarlet. Guiana. 1825.

Morphi'xia. A synonym of *Ixia*.

Mo'rus. Mulberry. (From *mor*, the Celtic for black; referring to the colour of the fruit. Nat. ord., *Urticaceæ*; Tribe, *Moreæ*.)

Seeds, layers, cuttings, and truncheons; in fact, you can scarcely fail to propagate the Mulberry, as pieces of the roots, branches, and even the stem, if stuck into the ground in a deciduous state, will grow more easily than a gooseberry-cutting; deep, sandy, or calcareous loam. Of the hardy kinds, *nitida* is the hardest, grown chiefly for its fruit. *Alba* is more tender, grown chiefly for its leaves for feeding the silkworm. See MULBERRY.

Moscha'ria. (From *moschos*, musk; a musk-smelling plant. Nat. ord., *Compositæ*; Tribe, *Mutisiaceæ*.)

Hardy annual. Seeds in a slight hotbed, in April; seedlings barden off, and transplant in open borders, in May.

M. pinnatifida. ½. July. Chili. 1823. B. R. t. 1564. Syn., *Gastrocarpha runcinata*, Swt. Fl. Gard. t. 229.

Moscho'sma. (From *moschos*, musk, and *osme*, smell. Nat. ord., *Labiatae*; Tribe, *Ocimoideæ*. Allied to *Ocimum*.)

Tender annual. Seeds in a hotbed, in beginning of April; seedlings potted and grown in

greenhouse in summer, or placed in the open border in June, in a sheltered situation; light, rich, sandy soil.

M. ocyroides. 1½. White. August. 1823.

Mosses are flowerless plants, ranking next below the Filicineæ. The central part of their stems consists of elongated cells, but they possess no true vascular bundles. Each plant consists of a simple or branched stem, bearing leaves, and reproductive organs. Of the latter, the males are termed *antheridia*, the females *archegonia*, and are generally seated in bud-like structures at the apex or on the side of the stem. After fertilization the fruit is produced, which consists of a capsule or *theca*, on a longer or shorter stalk (*seta*), containing numerous minute seeds or *spores*. When the spores are ripe the capsule opens by the falling off of a regular lid (*operculum*), which has been previously held on by an elastic band, the *annulus*. Inside the mouth of the capsule are a number of teeth (collectively known as the *peristome*) arranged in one or two rows; the number of these teeth is constant in each species, and is some multiple of four; they are hygroscopic, expanding when dry, and closing over the mouth of the capsule when moist, and thus allowing the spores to escape in such weather as is favourable for their dispersion. On the germination of the spores a green filamentous *protonema* is formed, from which a plant similar to the parent is produced. Some mosses are also reproduced by buds. Besides the true mosses, or *Bryaceæ*, there are the Alpine mosses or *Andreaeaceæ*, whose capsule bursts by longitudinal slits, and the Bog or Peat Mosses, or *Sphagnaceæ*, whose leaves and stems are furnished with cells with open pores, which are capable of retaining moisture for a considerable time, and thus are useful for wrapping round the roots of orchids and other plants, which require constant moisture. The Earth Mosses, or *Phascaceæ*, whose capsule is indehiscent, are now regarded as imperfectly developed members of various orders of the true mosses.

Moss is useful to the gardener for packing round the roots of plants, as mentioned above, and even some bulbous roots and orchids are cultivated in it. The chief kind used for this purpose is *Sphagnum*. A very pretty effect is produced on plants intended for exhibition by packing fresh *Decranum* (a very common moss) erect between the stem of the plant and the edge of the pot, as is done by some continental horticulturalists,

the plant appearing to rise from a miniature lawn.

Mossy lawns are on a soil which is unable to support a green sward of grass. When soil is exhausted, grasses begin to die off, and their place is taken by moss. The obvious mode, then, of proceeding, is to give the lawn a good top-dressing in winter, either of malt-dust, or nitrate of soda, or soot, or any manure containing an abundance of alkali. The gardener finds the growth of moss arrested by frequent raking in wet weather, or by the application of pounded oyster-shells; but these are mere palliatives, and not remedies. Make your grass healthy, and it will soon smother the moss.

The most effectual, most salutary, and least disagreeable remedy for moss on trees is of trivial expense, and which a gardener need but try upon one individual to insure its adoption. It is with a hard scrubbing-brush, dipped in a strong brine of common salt as often as necessary, to insure each portion of the bark being moistened with it, to scrub the trunks and branches of his trees at least every second year. It most effectually destroys insects of all kinds, and moss; and the stimulating influence of the application, and the friction, are productive of the most beneficial effects. The expense is not so much as that of dressing the trunks with a solution of lime, which, however efficient in the destruction of moss, is not so in the removal of insects, and is highly injurious to the trees, by filling up the respiratory pores of the epidermis, and is decidedly a promoter of canker.

On gravel walks, a strong solution of sulphate of copper (blue vitriol) has been found the most effectual destroyer of moss.

Moth. *Verba'scum blatta'ria.*

Mother of Thousands. *Lina'ria Cymbala'ria, Bellis pere'nnis, var. proli'fera, and Saxi'fraga sarmento'sa.*

Motherwort. *Leono'tis.*

Moths of most kinds are the parents of caterpillars preying upon some plant under the gardener's care, and should be destroyed whenever discovered. They generally fly at night, and are distinguished from butterflies by having pointed or plumose, not club-shaped antennæ or feelers.

Mottled Umbre-Moth. *Geome'tra.*

Mouldiness is the common term applied to that crop of fungi which ap-

pears on moist, putrescent vegetable matters. These fungi belong to various genera, and are generally destroyed when common salt or sulphur can be applied.

Mountain Ash. *Py'rus aucupa'ria.*

Mountain Ebony. *Bauhi'nia.*

Mountain Tobacco. *A'rnicamonta'na.*

Mouse-ear. *Hiera'cium stolonif'erum.*

Mouse-Thorn. *Centau'rea myca'ca'ntha.*

Moussou'nia. This genus has been formed of some species of *Gesnera*, but which we have not separated from that genus.

Mowing is, next to digging, the most laborious of the gardener's employments, and requires much practice, as well as an extremely sharp scythe, before he can attain to the art of shaving the lawn or grass-plot smoothly and equally. A mowing machine has been invented, which cuts, collects, and rolls the grass at the same time, and is better than the scythe for mossy lawns. It has now almost superseded the scythe for level lawns.

Mowing is most easily performed whilst the blades of grass are wet, as they then cling to the scythe, and are consequently erect against its cutting edge. The operation, therefore, should be performed early in the morning, before the dew has evaporated, or whilst the grass is wet from rain or artificial watering. See **Scythe**.

Mucu'na. Cow-itch. (The Brazilian name. Nat. ord., *Leguminosæ*; Tribe, *Phaseoleæ*. Allied to *Erythrina*. Syn., *Macranthus*.)

The hairs on the seed-pods of *M. pruriens* form the Cow-itch. Stove climbers, with purple flowers, which open in July. Cuttings of half-ripened shoots in sandy soil, under glass, in heat; rich, sandy loam. Winter temp., 55°; summer, 60° to 85°.

— *pruriens.* 12. E. Ind. 1680.

— *pruri'ta* of B. M. t. 4945. See *M. imbricata*.

— *sempervi'rens.* China. 1816, reintroduced 1889.

Mudar Plant. *Calotro'pis giga'ntea.*

Mudding, or **Puddling**, is dipping the roots of trees, shrubs, and seedlings in a thin mud or puddle, and retaining them there until again planted, when-

ever they are removed. It is one of the best aids to success, and should be universally adopted; for it is a rule without exception, that the less the roots of a plant are injured, and the moister they are kept during its removal, the less does it suffer by the transplanting. The best of all mnds for the purpose is formed of three pounds of garden-soil, one ounce of salt, eight ounces of soot, and one gallon of water.

Muehlenbe'ckia. (Named after Dr. G. Muehlenbeck. Nat. ord., *Polygonaceae*; Tribe, *Coccolobae*.)

Greenhouse half-shrubby perennials, mostly climbers. *M. compl'ea* is hardy. For cultivation, see COCCOLOBA.

M. adpre'ssa] Pink. Australia. 1822. Syns., *M. depressa* and *Polygonum adpressum*. B. M. t. 3145.

— *compl'ea*. Green, August. New Zealand. 1870.

Mue'llera. (Named after O. F. Muller, a Danish botanist. Nat. ord., *Leguminosae*; Tribe, *Dalbergieae*. Allied to *Dalbergia*.)

Stove evergreen shrub. Cuttings of half-ripened shoots in sand, under a glass, in heat; peat and land. Winter temp., 50° to 55°; summer, 60° to 85°.

M. monilif'ormis. 6. Yellow. Guiana. 1792.

Mulberry. *Mo'rus*.

Mulberry Culture. (*M. ni'gra*)—

Propagation: by Cuttings.—In former days this operation was much circumscribed, being limited to the cuttings of the young shoots, as in currants. Truncheons of considerable size may, and, indeed, ought to be used. These strike with facility by ordinary means, especially in the deciduous state, and put in the soil in the autumn, leaving only a bud or two exposed.

If *Truncheons* of some size are used, let them be taken from the tree in the beginning of February; and being inserted a foot deep, in a situation where neither direct sunshine nor wind can freely penetrate, envelope their stems above the ground-level with moss, all but the upper pair of buds, in order to prevent evaporation.

By Layers.—The shoots of the previous year are generally selected for this purpose, and may be either slit or ringed, although they will root without. This being performed in November, or in February, the young plants will be ready to be removed from the parent plant in twelve months, when they may

be placed in the nursery for two years, by which time they will be fit for their permanent situations, care being taken to train them to stems, as ordinary standard fruit-trees.

By Grafting.—Ordinary grafting, as in the apple, is not a very safe mode; but inarching, or grafting by approach, is quite eligible. This is performed exactly as in other trees, and will produce strong plants in a short time.

By Seeds.—This practice is seldom resorted to, but may prove interesting to some. The seed being washed from the pulp as soon as ripe, and dried, may be preserved through the winter in dry sand, and sowed in the succeeding February. A slight bottom-heat will facilitate the progress of the seedlings; but they may be safely reared without, by affording a regular but not excessive supply of moisture, with a partial deprivation of light for a while. They will need the ordinary routine of transplanting, etc., afterwards.

Culture during the Growing Period.—In the standard state little or nothing can be done; but those trained on walls or fences must have some assistance. It must be kept in view, that the mulberry produces fruit both on short-jointed young wood and on spurs, and that fruit must not be looked for from luxuriant shoots. The summer's dressing must consist in thinning-out and stopping the grosser shoots in crowded situations, observing a regularity in their distances for the admission of sunlight. We would advise much stopping in preference to much disbudding, as such parts may form a nucleus for future spurs; and if they turn out barren, it will be easy to remove them totally in the succeeding year. The mulberry, when trained, will extend a great way; and regular training, as the shoots extend, must be practised.

Culture during the Rest Period.—Some pruning is occasionally of benefit, even to standard trees, but it can be merely thinning out cross-shoots on those parts of the tree which are too crowded. The shady side of the tree, too, may be kept thinner than the sunny side; and watery spray springing from the branches in the interior may be removed. Those trained must have superfluous shoots and barren snags or spurs removed; but no shortening back is necessary.

Soil.—Any ordinary garden or field-soil will do for them, if not too clayey; for they rather prefer an upland or mel-low soil, which should be of a generous

character, but not enriched with manures until they get rather old and cease producing luxuriant wood, when a rich, mellow compost, as top-dressing occasionally, will much benefit them.

Forcing.—The mulberry bears forcing excellently, and will ripen its fruit early in June. It will bear a very high temperature. It may also be grown of a dwarf size in pots, and be thus forced.

Mulching is placing mulch, or long, moist stable-litter, upon the surface of the soil over the roots of newly-planted trees and shrubs. The best mode is to form a trench about six inches deep, to put in the mulch, and cover it with the earth. This prevents the mulch being dried or scattered by the winds, and is more neat than exposing it on the surface. Mulching keeps the moisture from evaporating, and prevents frost penetrating to the roots, straw being one of the worst conductors of heat. When rapid growth is desirable, the mulch should be kept on the surface, and removed at times in bright sunshine, that the soil may be heated; for, if deeply mulched, the leaves may be enjoying the climate of India, and the roots be nearly as cold as if in Siberia.

Mule, or Hybrid, is a plant raised from seed generated by parents of distinct species, and frequently unfer- tile. See **Hybridizing**.

Mulgedium. (Derivation not known. Nat. ord., *Compositæ*; Tribe, *Cichoraceæ*. Allied to *Hieracium*.) Referred to **Lactuca** in the Genera Plan- tarum.

A hardy herbaceous and a good rock-plant. Seeds and divisions in spring; dry, sandy soil.
M. acuminatum. See *Lactuca villosa*.
— *alpinum.* See *Lactuca alpina*.
— *giganteum.* 6 to 8. Blue-violet. 1889.
— *macrorrhizon.* See *Lactuca macrorrhiza*.

Mullein. *Verbascum*.

Mu'ndtia. (After *Henreich Mundt*, a seventeenth century botanist. Nat. ord., *Polygalaceæ*. Allied to *Muraltia*.)

The fruit is eatable. Greenhouse evergreen shrubs, from the Cape of Good Hope. Cuttings of stiff young side-shoots in May, in sand, under a bell-glass, and in a close, cold pit or frame; sandy peat. Winter temp., 40° to 45°.

M. spinosa. 3. White. March. 1780.
— *angustifolia.* 3. Purple. March. 1800.
— *latifolia.* 3. Lilac. February. 1800.

Munt'ngia. (Named after *A. Munting*, a German botanist. Nat. ord., *Tiliaceæ*; Tribe, *Tiliææ*. Allied to *Tilia*.)

Stove evergreen shrub, known as the *Calaburra* in South America. Cuttings of half-ripened

shoots in sand, under a glass, in heat; sandy, fibry loam and leaf-mould. Winter temp., 48° to 58°; summer, 60° to 85°.

M. calaburra. 3. White. June. Jamaica. 1690.

Muraltia. (Named after *J. V. Muralt*, a Swiss botanist. Nat. ord., *Polygalaceæ*. Allied to *Polygala*.)

Greenhouse evergreens, all but one purple-flowered, and all from the Cape of Good Hope. Cuttings of short young shoots in sandy peat, under a glass; chiefly peat earth, with a good portion of sand. Winter temp., 40° to 48°.

M. alopecuroides. 3. June. 1800.
— *clivaria.* 3. May. 1824.

Musa Culture. — *Propagation.* — Sir J. Paxton has suggested, that immediately the fruit is cut from the old plants, these be taken out of their tubs, partially disrooted, and placed in pots to produce suckers, which they will do readily, especially if plunged in a bottom-heat of about 85°. These suckers are removed into smaller pots, and cultivated from pot to pot, and thence to the tub, in which they are fruited.

Soil. — The soil must be exceedingly rich, and by no means adhesive; rather of a light character, and well-drained, in order that copious supplies of water may be given.

Culture. — A lively heat is the great essential, with a liberal amount of atmospheric moisture. A temperature ranging from 70° to 90° during the bright part of the year, and from 60° to 70° during the duller portion, will be requisite.

Suckers will produce fruit within the year; and if one be approaching too close on the heels of another in ripening, the whole spadix of fruit of the one may be cut off, with a portion of the stem, just where the upper tier of fruit is ripening, and suspended in a dry and airy room, after the manner of late grapes. Sir J. Paxton observes, that "he has had capital fruit from a spadix two months after it was cut." The produce of one plant will weigh from 15 to 30 pounds.

Musca lineata. (Syn., *Chlorops lineata*) is a fly, whose grub attacks the

young stems of wheat, but this damage is often repaired by the subsequent development of side shoots. This is one of the insects attacked by Ichneumon flies. The flies appear in May or the beginning of June.

Musca'ri. Grape Hyacinth. (From *moschos*, musk; the smell of the flowers. Nat. ord., *Liliaceae*; Tribe, *Scilleae*. Allied to *Hyacinthus*.)

Mushroom. *Agaricus campestris*. *Mushroom-beds*, for winter production, should be formed in August, and once in two months after, of dry materials, such as four or five barrow-loads of horse-droppings, which have been saved for the purpose, four or five barrow-loads of

road-sweepings, and four or five barrow-loads of dry, husky dung from the stable dung-heap. Let these be all well turned over three or four times to sweeten in some dry place. If the mixture should be found too dry to ferment sufficiently, then sprinkle it with a little water at the time of its being turned over. Shake it and mix it well together. The quantity of materials depends on the size of the beds required. The place where the beds are to be made should be dry at bottom. The materials being in good condition, proceed to make up your bed as solid and firm as it can be by beating it together with the fork, whether in ridges or half ridges, or whatever shape may be thought most convenient. Let the outside be beaten smooth and well with a shovel or spade. Then insert a stick to prove the temperature of the bed by. In about ten days after the bed has been made it will be fit for *spawning*, if all has gone on well, and the heat be found about that of cows' milk; but if the heat be too great, defer it for another week, and shake open the bed a little to let off the rank heat. If too cold, add a little fresh material, and work it up well together. Before putting in the spawn make the beds firm, smooth, and even; then open holes with the hand about an inch below the surface, and eight inches apart every way. Place in each hole a moderate-sized lump or handful of bits of spawn, and cover it over again with the same dry materials of the bed. If there is no fear of the bed being too hot, it may be covered over at the same time, about an inch and a half thick, with good turfy loam, rather dry, and run through a sieve first. When all is regularly covered over, sprinkle the whole with water from a fine rose water-pot, and pat the whole surface down level, leaving it as smooth as a fresh-plastered wall. Let it remain to dry off, giving plenty of air to dry it off the quicker. After this, the bed should have a covering of anything like mouldy hay, such as tops and bottoms from the hay-rick, or haybands untwisted, or the like. Cover up according to the heat of the beds. If you have any doubt whether it is too hot, let the covering be light; and at all times, when gathering the mushrooms, the short mulch should be cleared off from the bed's surface, or it will exhaust the bed by the encouragement it gives to the spawn to run out. A little additional litter may be added as required, so as to keep the beds in regular and uniform bearing, and gentle appli-

cations of tepid liquid-manure will be found of great benefit to those beds that have been much gathered from. Where the convenience of hot-water pipes, or other artificial means, can be commanded for mushroom culture, so that the right temperature can be at all times maintained, no kind of litter-covering need be applied. Mushroom-beds are always best made under cover, and even a cart-shed can be very easily converted into an excellent mushroom-house. Warm and gentle moisture has much to do with the growth of the mushrooms; therefore, if the shed is covered in with slate or tiles, the space between the rafters inside should be well stuffed with straw of any kind, which can be fastened up by nailing cross strips of boards from rafter to rafter. Then, after the bed is made, spawned, and finished, the front of the shed may be stopped up with thick and well-thatched hurdles, which would be warmer and better than any other thin permanent inclosure. These hurdles can be readily opened whenever light is wanting, either to examine the beds, or to cover, or to uncover, or to collect, the mushrooms. It is also convenient to be able to open the house opposite where you wish, either to get in fresh materials to make a new bed with, or to take out an old one. If the length of the shed be from 21 to 30 feet, it should give a large supply of mushrooms during the winter and spring months. The beds should be made along the back of the house.

Previously to making up the beds, a board about nine inches high should be placed as a frontage-board, from three to four feet distant from the wall, which is a good width for the bottom of the bed. This front board may be supported upright by driving three or four short stakes into the floor. The bed may be from two to three feet high at the back, sloping down to nine inches in front, which will give a very convenient width to reach over for all necessary purposes. Have the materials ready to make the first bed about the last week in August. Let this occupy one-third of the length of the shed. Make up another of the same size about the last week in October, and the remaining third about the 1st of January.

In four or five weeks after spawning, in spring and autumn, the bed should begin to produce, but not until much later in summer and winter; and if kept dry and warm, it will continue to do so for several months.

A gathering may take place two or three times a week, according to the productiveness of the bed. It sometimes happens that beds will not come into production for five or six months; they should not, therefore, be impatiently destroyed.

Watering.—In autumn, the bed will not require water until the first crop is gathered, but it is then to be repeated after every gathering; a sprinkling only is necessary. In spring and summer, during dry weather, the same course is to be pursued. As excessive or unequal moisture is studiously to be avoided, the best mode of applying the water is to pour it through a rose-pan on to a thin layer of hay, which has previously been spread over the bed, and thus allow it to percolate by degrees. In winter, waterings are not allowable; to keep the mould moist, hot fermenting mulch may be put on outside the covering. If the bed is in the open ground, on a warm day succeeding to wet weather, it may be left uncovered for not more than two or three hours. During excessive rains, the additional covering of mats, etc., must be afforded; and, on the other hand, if a moderate, warm shower occurs during summer, after excessive droughts, it may be fully admitted, by taking off the covering.

Mode of Gathering.—In gathering, the covering being carefully turned off, only such are to be taken as are half an inch or more in diameter before they become flat, but are compact and firm. Old mushrooms, especially, should be rejected for the table, as it is found that some which are innocuous when young become dangerous when tending to decay; they also then lose much of their flavour.

Each mushroom is detached by a gentle twist completely to the root; a knife must never be employed, for the stumps left in the ground decay, and become the nursery of maggots, which are liable to infect the succeeding crop.

Other Modes of Cultivation.—Some gardeners merely vary from the preceding by building entirely of dung, without any layers of earth. Many gardeners grow mushrooms in the same bed with their melons and cucumbers. The spawn is inserted in the mould, and on the hills of the beds, as soon as the burning heat is passed. In September or October, when the bines of the plants decay, the bed is carefully cleaned, the glasses put on and kept close, and when the earth becomes dry, water is frequently but moderately given, as well as every

gentle shower admitted when necessary. A gentle heat is thus caused, and the produce is often extraordinarily abundant, frequently two bushels, from a frame ten feet by six, and mushrooms have been produced two pounds in weight.

Hampers or boxes containing about four inches depth of fresh, dry stable-dung, or, in preference, of a mixture of three barrow-loads of horse-dung, and one of perfectly dry cow-dung, well pressed in, may be set in some situation where neither damp nor frost can enter. After two or three days, or as soon as heat is generated, the spawn may be inserted; a mushroom brick is to be broken into three equal parts, and each fragment to be laid four inches asunder on the surface of the dung; after six days, an inch and a half depth of fresh dung to be beaten down as before. In the course of a fortnight, or as soon as it is found that the spawn has run nearly through the whole of the dung, fine earth must be applied two inches and a half thick, and the surface made level. In five or six weeks the mushrooms will begin to come up, and if the mould appear dry, may then be gently watered, the water being slightly heated. Each box will continue in production six or eight weeks.

Mr. J. Oldaker, late gardener to the Emperor of Russia, introduced a house

purposely constructed for the growth of the mushroom. The house is found of great use in storing brocoli during the winter. It is usually built against the back wall of a forcing-house, as in the annexed plan; but if built unconnected with another building, the only necessary alteration is to have a hipped instead of a lean-to roof. The outside

wall, *G H*, should be eight feet and a half high for four heights, the width ten feet within the walls, which is most convenient, as it admits shelves three feet and a half wide on each side, and a space up the middle three feet wide, for a double flue, and wall upon it.

When the outside of the house is finished, a floor or ceiling is made over it, as high as the top of the outside walls, of boards one inch thick, and plastered on the upper side, *e e*, with road-sand, well wrought together, an inch thick; square trunks, *f*, being left in the ceiling, nine inches in diameter, up the middle of the house, at six feet apart, with slides, *s*, to ventilate with when necessary.

Two single brick walls, *v v*, each five bricks high, are then to be erected at three feet and a half from the outside walls, to hold up the sides of the floor-beds, *a a*, and form at the same time one side of the air flues. Upon these walls, *v v*, are to be laid planks four inches and a half wide, and three inches thick, in which are to be mortised the standards, *k k*, which support the shelves. These standards to be three inches and a half square, and four feet and a half asunder, fastened at the top, *k k*, into the ceiling. The cross bearers, *i i*, *i i*, which support the shelves, *o o*, must be mortised into the bearers and into the walls; the first set of bearers being two feet from the floor, and each succeeding one to be at the same distance from the one below it. The shelves, *o o*, are to be of boards one inch and a half thick, each shelf having a ledge in front, of boards one inch thick and eight inches deep, to support the front of the beds, fastened outside the standards. The flue to commence at the end of the house next the door, and running the whole length, to return back parallel, and communicate with the chimney; the walls of the insides to be the height of four bricks laid flat, and six inches wide; this will allow a cavity, *t*, on each side betwixt the flues, two inches wide, to admit the heat from their sides into the house. The middle cavity, *x y*, should be covered with tiles, leaving a space of one inch betwixt each. The top of the flue, including the covering, should not be higher than the walls that form the fronts of the floor-beds. The wall itself is covered with three rows of tiles, the centre one covering the cavity, *x y*, as before mentioned; the outside cavities, *t t*, are left uncovered.

As the compost, the formation of the beds, etc., are very different from the common practice, we will give Mr. Old-

aker's directions. The compost employed is fresh horse-dung, which has been subject neither to wet nor fermentation, cleared of the long straw, but one-fourth of the short litter allowed to remain, with one-fourth of dry turf-mould, or other fresh earth.

The beds are to be made by placing a layer of the above compost, three inches thick, on the shelves and floor, which must be beaten as close as possible with a flat mallet, fresh layers being added and consolidated until the bed is seven inches thick, and its surface as level as possible. If the beds are thicker, the fermentation caused will be too powerful; or if much less, the heat will be insufficient for the nourishment of the spawn. As soon as the beds indicate a warmth of 80° or 90°, they are to be beaten a second time, to render them still more solid, and holes made with a dibble, three inches in diameter and nine apart, through the compost, in every part of the beds; these prevent too great a degree of heat arising and causing rotteness.

If the beds do not attain a proper heat in four or five days after being put together, another layer, two inches thick, must be added. If this does not increase the heat, part of the beds must be removed, and fresh horse-droppings mixed with the remainder. The spawn is to be inserted in three or four days after making the holes, when the thermometer indicates the desired degree of heat, the insides of the holes are dry; and while the heat is on the decline, every hole is to be filled, either with lumps or fragments of spawn, well beaten in, and the surface made level.

In a fortnight, if the spawn is vegetating freely, and the beds are required for immediate production, they may be earthed over; but those for succession left unearched, three or four weeks in summer, and four or five in winter. If the spawn is introduced in hot weather, air must be admitted as freely as possible until the spawn has spread itself through the beds.

The soil employed should be maiden earth, with turf well reduced; neither too dry nor too wet, otherwise it will not be capable of being beaten solid. It must be laid regularly over the beds two inches thick. From the time of earthing, the room is to be kept at a temperature of 50° or 55°. If higher, it will weaken or destroy the spawn; if lower, it will vegetate slowly; and if watered in that state, numbers of mushrooms will be prevented attaining perfection. Water must be

applied with extreme caution, being nearly as warm as new milk, and sprinkled over the beds with a syringe or small watering pot. Cold water destroys both the crop and the beds. If suffered to become dry, it is better to give several light than one heavy watering.

Beds thus managed will bear for several months; and a constant supply of mushrooms kept up by earthing but one bed or more every two or three months.

If, when in full production, the mushrooms become long-stemmed and weak, the temperature is certainly too high, and air must be proportionately admitted. As the beds decline, to renovate them the earth must be taken off clean, and if the dung is decayed they must be reformed, any good spawn being preserved that may appear; but if the beds are dry, solid, and full of good spawn, a fresh layer of compost, three or four inches thick, must be added, mixed a little with the old, and beaten solid as before.

Mushrooms may be grown in a cellar, or other vaulted place, with equal success, and not unfrequently with a greater advantage, the same rules being adopted; but no fire is necessary and less water.

Spawn: where to be found.—Spawn is constituted of masses of white fibres, arising from the spores of mushrooms that have fallen into situations suitable for their germination, from which it is to be obtained: such places are stable dung-hills, dungy horse-rides in stable-yards, horse mill-tracks, dry spongy composts: the droppings of hard-fed horses also produce it in greater abundance than the dung of any other animal, and more sparingly under sheds, where horses, oxen, or sheep have been kept. The dung of the two latter affords it in greater perfection than that of grass-fed horses. It has also been found in pigeons' dung: but the most certain mode of obtaining it is to open the ground about mushrooms growing in pastures, though it is said not to be so productive.

Time of Collecting.—July, August, and September, it being reckoned in the greatest perfection in this last month. It may be found, however, and should be collected, when it appears in the spring. It generally occurs spread through the texture of cakes, or lumps of dry, rotted dung. Put it in a heap under a dry shed; and a current of air, passing through the shed, is of great utility. If

kept dry, spawn may be preserved three or four years; if damp, it will either vegetate before being planted or putrefy.

Spawn must not be so far advanced in vegetation as to appear in threads or fibres; for, when in this state, it is no longer applicable to a mushroom-bed; it may produce a mushroom if left to itself, but otherwise is useless. Spawn proper for inserting in a bed should have the appearance of indistinct white mould.

May be raised.—Spawn is capable of being raised artificially. The following is the manner:—Two barrow-loads of cow-dung, not grass-fed, one load of sheep's-dung, and one of horses', well-dried and broken so small as to pass through a coarse sieve, are well mixed, and laid in a conical heap during March, in a dry shed, being well trod as it is formed, to check its heating excessively. This heap is covered with hot dung, four inches thick, or only with mats if the shed is warm; for here, as in all the stages of growth, the heat should only range between 55° and 60°. In about a month the heap is examined; and if the spawn has not begun to run, which is shown by indistinct white fibres pervading its texture, another covering, of equal thickness to the first, is applied over the old one; in another month it will indubitably make its appearance. The time varies from three to ten weeks.

May be increased.—If a small quantity of spawn only can be collected, it may be increased in the following methods, the first of which is chiefly recommendable on account of its simplicity and facility of adoption:

Small pieces of the spawn may be planted a foot asunder, just beneath the surface of the mould of a cucumber-bed constructed in the spring. In about two months the surface of the spawn will assume a mouldy appearance; it may then be taken up, with the earth adhering to it, and when dried stored as before directed.

The second mode is variously practised. In the course of May a heap of the droppings of cows, sheep, and horses, or any one or two of them, without the admixture of any undecomposed straw, is to be collected, and one-fifth of road-scraping with one-twentieth of coal-ashes added, the whole being mixed together with as much of the drainings from a dunghill as will make it of the consistency of mortar. Being well incorporated, it is then to be spread in a dry sheltered, airy place, on a smooth surface, and beaten flat with a spade.

When become of the consistency of clay, it is to be cut into slabs about eight inches square, a hole punched half through the middle of each, and piled to dry, an opening being left between every two bricks. When perfectly dry, a fragment of the spawn is to be buried in the hole previously made: it will shortly spread through the whole texture of the slabs, if kept in a warm, dry place, when each may be broken into four pieces, and when quite dry laid on shelves—separate, and not in heaps, otherwise a bed will be formed for the spawn to run in. Mr. Wales recommends the composition to consist of three parts horse-dung without litter, two of rotten tree-leaves, two of cow-dung, one of rotten tanner's bark, and one of sheep's dung, mixed to the consistency of mortar, and moulded in small frames like those used by brick-makers, six inches long, four broad, and three deep. Three holes to be made half through the bricks, an inch apart, with a blunt dibble, for the reception of the spawn. They should be put on boards for the convenience of moving about during fine days, as they must be made perfectly dry, which they often appear to be on the outside when they are far otherwise internally. Before they are perfectly dry they require great care in handling and turning, from their aptitude to break; but in about three weeks, if dry weather, when perfectly dried, they become quite firm. To pervade them with the spawn, a layer of fresh horse-litter, which has laid in a heap to sweeten, as for a hotbed, must be formed, six inches thick, in a dry shed. On this a course of the bricks is to be laid, and their holes completely filled with spawn; and, as the bricks are laid in rows upon each other, the upper side of each is to be scattered over with some of the same. The bricks are not placed so as to touch, so that the heat and steam of the dung may circulate equally and freely. The heap is to terminate with a single brick, and when completed covered with a layer, six inches thick, of hot dung, to be reinforced with an additional three inches after a lapse of two weeks. The spawn will generally have thoroughly run through the bricks after another fortnight. If, however, upon examination, this is not found to be the case, they must remain for ten days longer. The bricks being allowed to dry for a few days before they are stored, will then keep for many years.

Mr. Oldaker recommends the bricks to be made of fresh horse-droppings,

mixed with short litter, to which must be added one-third of cow-dung, and a small portion of earth, to cement them together. The spawn to be inserted when they are half dry.

Quantity required.—One bushel of spawn is required for a bed five feet by ten; two bushels for one double that length; and so on in proportion.

Musk-akro. *Hibi'scus abelmo'schus*.

Musk-flower. *Mi'mulus moschatulus*.

Mussæ'nda. (The Cingalese name of *M. frondosa*. Nat. ord., *Eubiaceæ*; Tribe, *Mussændææ*. Allied to *Gardenia*.)

Stove evergreens. Cuttings in sandy soil, in heat, under a glass, in May; loam and peat. Winter temp., 50°; summer, 60° to 85°.

M. cocci'nea. 20. Red. August. Trinidad. 1825.

Mu'sschia. (In honour of *J. M. Mussche*, botanist. Nat. ord., *Campanulaceæ*; Tribe, *Campanuleæ*.)

Greenhouse plants. For cultivation, see CAMPANULA.

M. aurea. 1-2. Golden-yellow. Summer. Madeira. 1777. B. M. t. 6556. Syn., *Campanula aurea*.

— *Wollasto'ni*. 6. Purple. Madeira. 1857.

Mussel scale. See *Aspidiotus conchiformis*.

Mustard (*Sinapis alba*) succeeds best in a fine, rich, mouldy loam. In early spring, and late in autumn, the situation should be sheltered, and, during the height of summer, shaded from the mid-day sun.

Sowing, for salading, may be made throughout the year. From the beginning of November to the same period of March, in a gentle hotbed, or in the corner of a stove. From the close of February to the close of April it may be sown in the open ground, on a warm, sheltered border, and from thence to the middle of September in a shady one. For salading, sow in flat-bottomed drills, about a quarter of an inch deep, and six inches apart. The seed cannot well be sown too thick. The earth which covers the seed should be very fine. Water must be given in dry weather, as a due supply of moisture

is the chief inducement to a quick vegetation. The sowings are to be performed once or twice in a fortnight, according to the demand. Cress (*Lepidium sativum*) is the most constant accompaniment of this salad-herb; and as the mode of cultivation for each is the same, it is only necessary to remark that, as cress is rather slower in vegetating than mustard, it must, for the obtaining them in perfection at the same time, be sown five or six days earlier. Cut for use whilst young, and before the rough leaves appear.

To obtain Seed, sow thin. When the seedlings have attained four leaves, thin them to eight or nine inches apart. If dry weather occurs at the time of flowering, water may be applied with great advantage to their roots. The plants flower in June, and are fit for cutting when their pods are brown. They must be thoroughly dried before threshing and storing.

Forcing.—For forcing, sow in boxes or pans, even if a hotbed is appropriated to the purpose. Pans of rotten tan are to be preferred to pots or boxes of mould; but whichever is employed, the seed must be sown thick, and other directions attended to, as for the open-ground crops. The hotbed need only be moderate.

Mustard Beetle. *Phædon beetle*.

Muti'sia. (Named after *C. Mutis*, a South American botanist. Nat. ord., *Compositæ*; Tribe, *Mutisiaceæ*. Allied to *Barnadesia*.)

Stove climbers. Cuttings of half-ripened shoots in May, in sand, under a bell-glass, and in a gentle bottom-heat. Common stove temp. *M. latifolia* should be tried against a wall.

M. arachnoidea. 6. Red. July. Brazil. 1823. Syn., *M. speciosa*.

- *breviflora*. Chili. Gf. t. 1163, fig. 1.
- *Clematis*. Scarlet. New Grenada. 1859.
- *decurrens*. Orange. Chilian Andes. Hardy.

- *versicolor*. Chili. Gf. t. 1163, fig. 2.
- *virgata*. Bright orange. Peru, Bolivia and Chili. 1837. Rev. Hort. 1891, p. 228.

My'agrum. (From *myia*, a fly, and *agra*, capture; referring to the clamminess of the plant. Nat. ord., *Cruciferae*; Tribe, *Isatideæ*. Allied to *Isatis*.)

Hardy annual. Seeds in open border, in April.

M. perfoliatum. †. Pale yellow. June. France. 1648.

Myan'thus. Flywort. (From *myia*, a fly, and *anthos*, a flower; its appearance when dried. Nat. ord., *Orchideæ*; Tribe, *Vandææ-Stanhopeæ*.) See *Catasetum*.

Flowers of *M. barbatus* and *Monachanthus viridis* has been produced on a spike of *Catasetum*, showing the uncertainty of the laws on which genera and species were founded in Orchids. The differences in this case are now known to be due to the difference in structure between the male and female flowers. *Catasetum* being the older name, *Monachanthus* and *Myanthus* have been united to it.

Mycara'nthes. (Same derivation as *Myanthus*. Nat. ord., *Orchideæ*; Tribe, *Epidendreae-Eriaceæ*.) A synonym of *Eria*.

M. obliqua. White. Singapore. 1840.

Myg'inda. (Named after *C. Mygind*, a German botanist. Nat. ord., *Celastreae*; Tribe, *Celastreae*. Allied to *Elæodendron*.)

Evergreen shrubs, all white-flowered but one. They require stove-treatment, and are propagated by ripe shoots in sand, under a bell-glass, in heat; loam and peat, sandy and fibry.

M. integrifolia. 4. Martinique. 1826.

— *latifolia*. 4. April. W. Ind. 1795.

Myloca'ryum. Buckwheat-tree. (From *myla*, a mill, and *karyon*, a nut; having four-winged seeds. Nat. ord., *Cyrtillaceæ*.) See *Cliftonia*.

M. ligustrinum. B. M. t. 1625. See *Cliftonia ligustrina*.

Myopo'rum. (From *myo*, to shut, and *poros*, a pore, or opening; referring to the transparent spots on the leaves. Nat. ord., *Myoporineæ*.)

Greenhouse, white-flowered, evergreen shrubs, from New South Wales. Cutting of the points of shoots, getting firm at their base, in sand, under a bell-glass, in April; loam and peat, fibry and sandy, with pieces of charcoal intermixed. Winter temp., 38° to 48°. *M. parvifolium* and others would, no doubt, succeed against a wall, where protection could be given in winter.

M. acuminatum. 3. 1812.

— *crassifolium*. 1½. New Zealand. 1822.

— *debile*. 1½. Pink. June. 1799. B. M. t. 1830.

Myosoti'dium. (From *Myosotis*, and *eidos*, resembling; the flowers being like those of the Forget-me-not. Nat. ord., *Boraginæ*; Tribe, *Borageæ*.)

Hardy herbaceous perennial.

M. noble. 1½. Blue, white. April. Chatham Islands. 1858. B. M. t. 5137.

Myoso'tis. Forget-me-not. (From *mus*, a mouse, and *otis*, an ear; resemblance of the leaves. Nat. ord., *Boraginæ*; Tribe, *Borageæ*.)

Seed for annuals, and also for the perennial herbaceous species; most of the latter freely, by dividing the root in spring; the scarcer ones by cuttings in a shady place; in summer, under a hand-light; moist places, by the side of ditches and ponds, suit most of them. *M. palustris* is the true Forget-me-not. It, as well as others, may be treated like alpine plants in winter, and have a saucer of water below the pot in summer, when they will bloom long and well.

Myria'ctis. (From *myrios*, a myriad, and *atkin*, a sunbeam; referring to the

florets. Nat. ord., *Compositæ*; Tribe, *Asteroidææ*. Allied to *Bellis*.)

Half-hardy herbaceous. Seeds in spring, in a gentle heat; division of the plant as growth commences; sandy loam; the protection of a cold pit will generally be necessary in winter.

M. Gmelini. White. June. Persia. 1836.

Myriade'nus. (From *myrios*, a myriad, and *aden*, a gland; the leaves are thickly beset with glands. Nat. ord., *Leguminosææ*; Tribe, *Hedysarææ*.) See *Zornia*.

M. tetraphyllus. See *Zornia tetraphylla*.

Myri'ca. Candleberry Myrtle. (From *myrio*, to flow; inhabiting the banks of rivers. Nat. ord., *Myrtaceæ*.)

The berries of *M. cerifera* yield a large proportion of wax, of which candles are made; hence the name. Greenhouse kinds, by cuttings under glass, in a shady place, in autumn and spring, but without bottom-heat; peat, moist and sandy. Hardy kinds, by seeds sown as soon as ripe, by layers, by cuttings, and by suckers and division. The *M. ga'le* is one of our hardest plants, and is used for many purposes, such as placing its leafy, dried twigs among clothes to give them an agreeable scent, and keep away moths, and to banish vermin from beds. The berries put into beer render it as intoxicating as those of the *Cocculus Indicus*, and, when distilled while they are fresh, they yield an essential oil. All like rather moist, sandy peat.

HARDY SHRUBS.

- M. asplenifolia*. 4. Brown. April. N. Amer. 1714. Syn., *Comptonia asplenifolia*.
 — *californica*. 4. Green. July. California. 1848.

 — *rubra*. Greenish; fruit red, purple. China, Japan. 1868. Syn., *M. Nagi*. B. M. t. 5727. The *Yang-mae*; fruit eatable.

Myrica'ria. (From *myrike*, the Greek name of the Tamarisk. Nat. ord., *Tamariscinææ*; Tribe, *Tamariscinææ*.)

Hardy, pink-flowered, evergreen shrubs. Cuttings of young shoots in spring or autumn, in sandy soil, under a bell-glass; or, if under a hand-light, all the better; sandy loam and leaf-mould, and all the better for a little peat.

- M. dahurica*. 6. Dahuria. 1816.
 — *germanica*. 8. July. Germany. 1582.

Myrioca'ropa. (From *myrios*, a myriad, and *karpos*, a fruit. Nat. ord., *Urticaceæ*.)

Stove shrub of bold habit.

- M. colibensis*. Flowers small, in pendulous spikes two feet long. Mexico. Syn., *M. stipitata*.

Myriophyllum. Water-Milfoil. (From *myrios*, a myriad, and *phyllon*, a leaf. Nat. ord., *Haloragacæ*.) Allied to *Hippuris*.)

Hardy perennial, British water-plants, except *M. proserpinacoides*, suitable for the margins of lakes, ponds, etc. Chiefly by division; ponds and ditches; interesting little aquatics.

- M. alterniflorum*. 1. July.
— *pectinatum*. Rose. July.
— *proserpinacoides*. Brazil, Chili, 1878. Syn., *Herpestes reflexa*.
— *spicatum*. 1. Red. July.

Myro'balan plum. *Pru'nus cerasi'fera*.

Myro'dia. (From *myron*, fragrant balsam, and *osme*, smell. Nat. ord., *Sterculiaceæ*; Tribe, *Helicteræ*. Allied to *Helicteres*.)

Stove evergreen. Cuttings of half-ripened shoots insand, under a bell-glass, and in heat; rich, sandy loam. Winter temp., 55°; summer, 60° to 85°.

- M. turbinata*. 6. White. W. Ind. 1793.

Myro'sma. (From *myron*, fragrant balsam, and *osme*, smell. Nat. ord., *Scitamineæ*; Tribe, *Marantææ*.)

- M. cannaefolia*. A synonym of *Calathea Myrosma*.

Myrospe'rmum. (From *myron*, myrrh, or aromatic balsam, and *sperma*, a seed; the seeds yield a strong-smelling resin. Nat. ord., *Leguminosæ*; Tribe, *Sophorææ*. Allied to *Sophora*.)

Stove evergreen trees. Cuttings of half-ripened shoots insand, in summer, under a bell-glass, and in bottom-heat; loam and peat, with an addition of silver sand and leaf-mould. Winter temp., 55°; summer, 60° to 85°.

- M. frutescens*. 10. Rose. May. Caraccas 1824.

M. peruvianum. See *Myrozyllon peruvianum*.

— *pubescens*. See *Myrozyllon pubescens*.

— *Toluiferum*. See *Myrozyllon Toluiferum*.

Myro'xylon. (From *myron*, fragrant balsam, and *xylon*, wood; the wood contains a sweet-scented balsam. Nat. ord., *Leguminosæ*; Tribe, *Sophorææ*. Syn., *Toluifera*.)

This is the genus which produces the Balsam of Tolu and Balsam of Peru, used in perfumery and in the preparation of lozenges. For culture, see MYROSPERMUM, in which the species were formerly included.

- M. peruvianum*. 40. White. Peru. 1824. Peru Balsam Tree.
— *pubescens*. 40. White. Carthage. 1820.
— *Toluiferum*. 40. Cream. S. Amer. 1733. Syn., *Toluifera balsamum*. Tolu Balsam Tree.

My'rrihis. Myrrh. (From *myrrah*, myrrh, or perfumed balsam. Nat. ord., *Umbellifereæ*; Tribe, *Ammineæ*. Allied to *Scandix*.)

This is the British Myrrh, formerly used in various ways. Hardy herbaceous. Seeds, dividing at the root, and slips inserted early in spring in a shady place; common garden-soil.

- M. odorata*. 2½. White. May. Britain.

Myrsi'ne. (The ancient name of myrrh. Nat. ord., *Myrsineæ*; Tribe, *Eumyrsineæ*. Allied to *Ardisia*.)

Greenhouse evergreens. Cuttings of stubby shoots before they are quite ripe, in sand, under a glass, in heat; fibry loam and sandy peat, Winter temp., 38° to 48°.

- M. africana*. 4. Brown. May. Cape of Good Hope. 1691.

Myrsiphyllum. (From *myrsine*, myrrh, and *phyllon*, a leaf; aromatic leaves. Nat. ord., *Liliaceæ*; Tribe, *Asparagææ*.) Now united to *Asparagus*.

Greenhouse deciduous twiners, with greenish-white flowers, from Cape of Good Hope. Division of the root in spring; sandy loam and dried leaf-mould. Winter temp., 40° to 48°.

- M. angustifolium*. 6. July. 1752. A synonym of *Asparagus medeloides*, var. *angustifolium*.

- M. asparagoides*. 6. June. 1702. B. M. t. 5584. A synonym of *Asparagus medeloides*.
 — *falciformis*. See *Asparagus medeloides*, var. *falciformis*.

Myrtus. The Myrtle. (From *myron*, signifying perfume. Nat. ord., *Myrtaceæ*; Tribe, *Myrteæ*.)

The French perfume called *Eau d'Ange* is obtained from the distilled water of myrtle-flowers; and myrtle-berries and flower-buds are eaten in Italy for pepper. Evergreens, and all white-flowered but two. Cuttings of half-ripened shoots in sandy soil, under a glass; sandy loam and a little peat or leaf-mould, or very old, rather dry cow-dung. Winter temp., 35° to 45°. The stove kinds merely require a higher temperature. The varieties of *communis* are propagated by cuttings, or by grafting and budding on the commoner kinds. In the south of England the myrtle flourishes against a wall; but north of London, in such a position, it requires protection in winter.

STOVE EVERGREENS.

GREENHOUSE EVERGREENS.

- M. affinis*. 6. Purple. June. China. 1823.
 — *bullata*. 18. White. July. New Zealand. Ic. Pl. t. 557.
 — *Cheken*. White. Chili. 1867. Syn., *Luma Cheken*. B. M. t. 5044. Half-hardy.
 — *apiculata*. 3. White. Chili. 1877.
 — *communis*. 6. June. South Europe. 1597. Sibth. Fl. Gr. t. 475.
 — *baetica*. 6. July. South Europe. 1597.
 — *belgica*. 6. July. South Europe. 1597.
 — *fore-pleno*. 6. July. South Europe. 1597.
 — *italica*. 6. July. South Europe. 1597.
 — *lusitana*. 6. July. South Europe. 1597.
 — *maculata*. 6. July. South Europe. 1597.
 — *mucronata*. 2. July. South Europe. 1597.
 — *romana*. 6. July. South Europe. 1597.
 — *tarentina*. 6. July. South Europe. 1597.
 — *variegata*. 6. July. South Europe. 1597.
 — *Luma*. 3. White. Chili. Syn., *Eugenia Luma*. B. M. t. 5040.
 — *apiculata*. 3. White. Chili. Syns., *Eugenia apiculata* and *E. Luma*, var. *apiculata*. Gf. t. 390.
 — *melastomoides*. 15. Moreton Bay.
 — *tenuifolia*. 5. N. Holland. 1824.
 — *tomentosa*. 6. Purple. June. China. 1776. B. M. t. 250.
 — *trinervis*. 5. N. Holland. 1824.
 — *Ugni*. 3. Pink. July. South Chili. 1861. Syn., *Eugenia Ugni*. B. M. t. 4626.

Mystacidium. (From *mustax*, a moustache; the column is furnished with a line of hairs at the top. Nat. ord., *Orchidææ*; Tribe, *Vandææ*—*Sarcandtheæ*.)

- Culture same as for *ANGRÆCUM*, which see.
M. distichum. †. Green, white. September. Sierra Leone. 1835. Syn., *Angræcum distichum*. B. R. t. 1781.
 — *filiciforme*. White. Natal. G. C. 1837. ii. p. 123, fig. 33.

N.

Nægelia. (Named in honour of Dr. *Nägeli*, an eminent German botanist. Nat. ord., *Gesneraceæ*; Tribe, *Gesneræ*. Allied to *Achimenes*.)

Stove herbaceous perennials. For cultivation, see *GESNERA*, under which genus the species were formerly included.

- N. achimenesoides*. Yellow, rose. Hybrid. 1836.
 — *ambilis*. A synonym of *N. multiflora*.
 — *cinnabarinæ*. 2. Scarlet. Mexico. 1856. Syn., *Gesnera cinnabarinæ*. B. M. t. 5036.
 — *fulgida*. Scarlet, white. Vera Cruz. 1867.
 — *bicolor*. Vermilion, white. Garden variety. Fl. Ser. t. 1755.
 — *Geroltiana*. 2. Orange-scarlet. Mexico. 1844. Syn., *Gesnera Geroltiana*.
 — *multiflora*. 2. White. August. Mexico. Syns., *Achimenes multiflora*, *A. ambilis*, *Gesnera amabilis*, B. M. t. 5083, and *G. multiflora*.
 — *zebrina*. 2. Scarlet, yellow. September. Brazil. 1840. Syn., *Gesnera zebrina*. B. M. t. 3940.

Nage'lia. (Named after *Nageli*, a German botanist. Nat. ord., *Rosaceæ*; Tribe, *Pomeæ*.) See **Cotoneaster**.

N. denticulata. See **Cotoneaster denticulatus**.

Nails for training wall-trees are best made of cast iron, being the cheapest, stoutest, and most enduring. Before using they should be heated almost to redness, and then be thrown into cold linseed oil. When dry, they have a varnish upon them which preserves them from rusting, and prevents the mortar of the wall sticking to them so corrosively as it does if they are oil-less. In drawing old nails from walls, the mortar is not so much disturbed if the nails are driven in a little further before they are extracted. Old nails may be renovated by being heated to redness, and then thrown into water: this removes from them the mortar, and then they may be again heated and put into oil as before directed. The cast-iron nails used by gardeners are known to the ironmonger as wall-nails, and are described as 2½, 3, 4, and 5 lb. wall-nails, accordingly as 1,000 of them are of those weights. Nails, in most cases, require to be driven only a very little way into the mortar, and walls then do not become defaced by them for many years. In all summer nailing of peach-trees, roses, etc., the point only requires to be driven in, so that the nail may be easily withdrawn by the fingers.

Na'ma. (From *nama*, a stream of water; the natural place of growth. Nat. ord., *Hydrophyllaceæ*; Tribe, *Malvaceæ*. Allied to *Wigandia*.)

Seeds sown in a hotbed, in March and April, and bloomed in the greenhouse, after being hardened; divisions and cuttings of the plant in spring; sandy loam and fibrous peat, with sand and charcoal to keep it open. Common stove and greenhouse temperature.

N. jamaicensis. White, blue. June. Jamaica. 1812. Stove annual.

— *Parryi*. 4-5. Lilac-purple. California. 1881. Half-hardy herbaceous perennial.

— *undulata*. 1. Violet. June. Mexico. 1828. Greenhouse herbaceous.

Nandi'na. (From *nandin*, the Japanese name. Nat. ord., *Berberidææ*; Tribe, *Berberacæ*. Allied to *Leontice*.)

Greenhouse evergreen shrubs. Cuttings of ripened shoots in sand, under a hand-light, and not hurried; loam and sandy peat; a sheltered place, a cold pit, or a greenhouse in winter. An interesting plant, with white petals, yellow anthers, and red fruit.

N. demuda'ta. 6. 1879.

— *domestica*. 6. White. July. China. 1804. B. M. t. 1109.

Na'nnorhops. (From *nannos*, dwarf, and *rhops*, a bush; referring to the habit of this plant. Nat. ord., *Palmææ*.)

Small stove palm. Sandy loam, leaf-soil, and a little charcoal, with thorough drainage. Seeds and offsets. Fans, baskets, etc., are made from the leaves.

N. Ritchea'na. 3-20. India.

Nano'des. (From *nanodes*, a pigmy. Nat. ord., *Orchidææ*; Tribe, *Epidendrea-Laeliææ*.) United with *Epidendrum* by Bentham and Hooker.

Stove orchid. See ORCHIDS.

N. di'scolor. †. Purple. August. Rio Janeiro. B. R. t. 1541.

— *Medu'sæ*. 1. Purple, green. Andes. B. M. t. 5723.

Napa'a. (From *ne*, not, and *paos*, shining. Nat. ord., *Malvaceæ*.)

Hardy, herbaceous perennial. Division. Seeds. *N. dio'ica*. 6. United States.

Napoleo'na. (Named after *Napoleon Bonaparte*. Nat. ord., *Myrtaceæ*; Tribe, *Lecythidææ*.)

Stove evergreen shrubs. Cuttings of half-ripened shoots, two to four inches long, in sand, under a bell-glass, and in a mild bottom-heat, giving air at night, to prevent damping; sandy peat and fibry loam. Winter temp., 55° to 60°; summer, 60° to 90°, and moist.

N. cuspidata. Cream, crimson. 1886.

— *imperialis*. 6. Apricot, crimson. May. Sierra Leone. 1844. B. M. t. 4387.

— *Miersii*. B. M. t. 7199. Syn., *N. Whitfieldii*.

Napoleon's Weeping Willow. *Salix Napoleo'na*.

Narave'lia. (From *narawæl*, its Cingalese name. Nat. ord., *Ranunculaceæ*; Tribe, *Clematidææ*. Allied to *Clematis*.)

Stove evergreen climber. Cuttings of half-ripened shoots in sand, under a glass, in heat; sandy peat and fibry loam. Winter temp., 50° to 60°; summer, 60° to 85°.

N. zeyla'nica. 12. Yellow. Ceylon. 1796.

Narci'ssus. (Name of a youth, said to have been changed into this flower. Nat. ord., *Amaryllidææ*; Tribe, *Amaryllææ*. Syn., *Chione*, *Corbularia*, *Ganymedes*, *Helena*, *Hermione*, *Illus*, *Jonguilla*, *Philogyne*, *Plateana*, *Prasiteles*, *Queltia* and *Tityrus*.)

This genus of hardy bulbs, like the *Rhododendron*, has so multiplied, that it is utterly impossible to make out what are, and what are not, true species. Of recent years names have been given to the slightest forms, one grower distinguishing about two hundred named forms of *N. Pseudo-narcissus*. To have included all such forms would have occupied too much space in a work of this kind; only the more distinct or widely known ones will, therefore, be found in the subjoined list. Salisbury and Haworth gave generic names, as above, to the different groups; but their definitions have broken down. For all practical purposes, the whole may be included under the old name *Narcissus*. Seeds, but chiefly by offsets from the bulbs, which, in most kinds, are freely produced; rich, sandy loam, with a little leaf-mould. Those to be forced early should be removed out of the ground as soon as the leaves decay, and be kept dry and cool until potting-time, in autumn.

N. absci'ssus. A form of *N. Pseudo-narcissus*.

— *albicans*. See *N. Pseudo-narcissus*, var. *moschatus*.

— *albus*. See *N. biflorus*.

— *anyustifolius*. See *N. poeticus*, var. *radiiflorus*.

— *aperticorona*. Yellow, orange. April. N. Africa. A *Tazetta* form.

— *aurantius*. See *N. incomparabilis*, var. *aurantius*.

— *Backhou'sei*. Sulphur and lemon-yellow. Garden hybrid.

— *Ba'ria*. See *N. Tazetta*, var. *Luna*.

— *Ba'rrii*. Varying from sulphur to orange-yellow. Garden hybrid.

— *bicolor*. See *N. Pseudo-narcissus*, var. *bicolor*.

— *bicrenatus*. See *N. intermedium*.

— *biflorus*. 1. White. Pale yellow. May.

— *bi'frons*. 1. Yellow. March. S. Europe. A form of *N. intermedium*.

— *bre'vistos*. B. M. t. 1187. See *N. Pseudo-narcissus*, var. *bicolor*.

— *Broussonetii*. 1½-2. Pure white. Morocco. 1888. Corona absent, or very rudimentary.

— *Bulbocodium*. †. Bright yellow. April. S. Europe and N. Africa. 1629. B. M. t. 88. Hoop peticocat *Narcissus*.

— *citrinus*. Sulphur-yellow. Flowers larger.

— *conspicuus*. †. Yellow. May. Syn., *N. conspicuus*.

— *Græ'vii*. †. Sulphur-yellow, green. Spring. Spain. 1879. Syn., *N. Grællvii*.

— *monophyllus*. White. January. Algeria. 1870. Syn., *N. monophyllus*. B. M. t. 5831.

— *nivalis*. White. Dwarf.

— *tenusifolius*. Swt. Fl. Gard. t. 114.

— *Burbi'dgei*. 1. White, yellow, red. Garden hybrid.

— *calathinus*. B. M. t. 934. See *N. odorus*.

— *ca'mbricus*. A form of *N. Pseudo-narcissus*.

— *canadensis*. Red. Lil. t. 188. See *N. Pseudo-narcissus*, var. *moschatus*.

— *ca'pax*. †. Pale yellow. May.

- N. cerinus*. 1. White. April.
 — *cernuus* of Swt. Fl. Gard. ser. 2, t. 101, is a form of *N. Pseudo-narcissus*, var. *moschatius*; of Salisbury, B. M. t. 48, is a form of *N. triandrus*.
 — *citrius*. 1. White, yellow. April. A form of *N. Bulbocodium*.
 — *compressus*. 1. Yellow. March. Spain. A form of *N. intermedius*.
 — *concolor*. A form of *N. incomparabilis*.
 — *conspicuosus*. $\frac{1}{2}$. Yellow. May. Swt. Fl. Gard. ser. 2, t. 326. A form of *N. Bulbocodium*.
 — *crenula*. 1. White. April. Spain.
 — *Curtisii*, B. M. t. 78. See *N. odoratus*, var. *trilobus*.
 — *cyclamineus*. B. M. t. 6950. See *Narcissus Pseudo-narcissus*, var. *cyclamineus*.
 — *Cypri*. 1. White, yellow. March. Cyprus. A *Tazetta* form.
 — — *corona plena*. 1. White, yellow. March.
 — *deficiens*. See *N. serotinus*, var. *deficiens*.
 — *du'bus*. White. April. France. A *Tazetta* form.
 — *Egystette'nsis*. Lemon-yellow. Double-flowered form of *N. Pseudo-narcissus*. For the history of this very old form, see G. C. 1883, xix. p. 412.
 — *Fenzli*. Garden hybrid. 1891.
 — *festuosus*. 2. White, yellow. April. A *Tazetta* form.
 — *floribundus*. $1\frac{1}{2}$. White, yellow. March. Spain. A *Tazetta* form.
 — *galanthifolius*. $\frac{1}{2}$. White. May.
 — *Gouani*. See *N. incomparabilis*.
 — *grandifolius*. $1\frac{1}{2}$. Yellow. April. B. R. t. 816.
 — *grandiflorus*. 1. White, yellow. April.
 — *Haworthii*. 1. Yellow. April. 1790.
 — — *plenus sulphureus*. Sulphur. April. 1829.
 — *heminalis*. 1. Yellow. March. A form of *N. odoratus*, var. *trilobus*.
 — *Horsfieldii*. See *N. Pseudo-narcissus*, var. *bicolor*.
 — *Hu'mei*. Sulphur and lemon-yellow. Hybrid.
 — — *albidus*. White, lemon-yellow.
 — *incomparabilis*. 1. Yellow. April. Portugal. 1829. B. M. t. 121. Syn., *N. Gouani*, Red. Lil. t. 220, and *Queltia fetida*.
 — — *alba*. White. Lemon-yellow.
 — *aurantiaca*. Pale yellow. The double form is known as Butter and Eggs.
 — — *Leedsii*. Rim of corona orange-red.
 — *concolor*. Pale lemon-yellow.
 — *nevada*. White, lemon-yellow.
 — *inflatus*. $\frac{1}{2}$. Yellow. March.
 — — *minor*. $\frac{1}{2}$. Pale sulphur. March. Spain. 1696.
 — *infundibularis*. $\frac{1}{2}$. Yellow. March.
 — *interjectus*. 1. Yellow. April. 1810. A form of *N. odoratus*.
 — *intermedius*. $1\frac{1}{2}$. Pale yellow. March. Pyrenees. Red. Lil. t. 427. Forms of this are:—*N. compressus*, *N. bifrons*, *N. primulina*, and *N. radiatus*.
 — *italicus*. 1. Pale yellow. March. South Europe. B. M. t. 1188. A *Tazetta* form.
 — — *plenus*. 1. Cream. March. Italy.
 — — *semiplenus*. 1. Cream. Italy.
 — *Jongqu'illa*. $\frac{1}{2}$. Pale yellow. April. Spain. 1596. B. M. t. 15.
 — — *stovrepleno*. 1. Yellow. April. Spain. 1596.
 — *juncifolius-murticus*. Lemon-yellow. Pyrenees. G. C. 1889, vi. p. 161, fig. 22. Natural hybrid.
 — *juncifolius*. Yellow. South Europe.
 — — *rupicola*. Yellow. April. South of France. B. M. t. 6478C. Syn., *N. apodanthus*.
 — *latifolius*. 1. Yellow. April.
 — *Leedsii*. White, sulphur. Garden hybrid. See also *N. incomparabilis*, var. *Leedsii*.
N. lobularis. A form of *N. Pseudo-narcissus*.
 — *longiflorus*. B. M. t. 924. See *N. Pseudo-narcissus*, var. *moschatius*.
 — *lorifolius*. 1. Yellow. March. B. M. t. 1187. A form of *N. Pseudo-narcissus*, var. *major*.
 — — *anceps*. 1. Yellow. March. 1800.
 — — *bre'viflorus*. 1. Yellow. April.
 — *lu'na*. 1. White. April. A *Tazetta* form.
 — *Macleri*. $\frac{1}{2}$. Cream. March. Smyrna. 1815. B. R. t. 987. A hybrid.
 — *maja'lis*. B. M. t. 193. See *N. poeticus*, var. *radiiflorus*.
 — *ma'jor*. 1. Yellow. March. Spain. 1692.
 — *Margaritae*. Garden hybrid. 1891.
 — *Mastersiana*. Creamy-white, pale primrose. 1882. Garden hybrid.
 — *maximus*. 1. Yellow. April.
 — *medio-luteus*. See *N. biflorus*.
 — *minimus*. A form of *N. Pseudo-narcissus*, var. *minor*.
 — *minor*. $\frac{1}{2}$. Yellow. March. Spain. 1629.
 — *monophyllus*. See *N. Bulbocodium*, var. *monophyllus*. B. M. t. 5831. A hybrid between this and *N. calathinus* was raised in 1890.
 — *montanus*. B. R. t. 123. See *N. poculiflorus*.
 — *moschatius*. B. M. t. 1300. See *N. Pseudo-narcissus*, var. *moschatius*.
 — *multiflorus*. 1. Yellow. April.
 — — *auratus*. 1. Yellow. April.
 — *na'nus*. A form of *N. Pseudo-narcissus*, var. *minor*.
 — *neglectus*. White, yellow. April. Naples. 1830.
 — *Nelsoni*. Lemon-yellow. Garden form.
 — *nevus*. 1. White. May. South Europe.
 — *no'bilis*. 1. Yellow. April. Syn., *Ajax nobilis*, Red. Lil. t. 158. A form of *N. Pseudo-narcissus*.
 — *notans*. 1. Yellow. April. South Europe. 1789.
 — *obsoletus*. A form of *M. serotinus*, var. *elegans*.
 — *obvallaris*. A form of *N. Pseudo-narcissus*, var. *major*.
 — *odoratus*. 1. Yellow. May. South Europe. 1629. Red. Lil. t. 157. Syn., *N. calathinus*. B. M. t. 934.
 — — *luteus*. A small form. Syn., *N. odoratus* of B. M. t. 78.
 — — *minor*. Yellow. Syn., *N. pseudo-juncifolius*.
 — — *rugulosus*. Yellow.
 — — *trilobus*. Yellow.
 — *pachybotrys*. See *N. Tazetta*, var. *vachybotrys*.
 — *pallidus*. B. M. t. 6473A. See *N. triandrus*.
 — *pallidus pro'cox*. A form of *N. Pseudo-narcissus*, var. *major*.
 — *papyraceus*. 1. White. March. B. M. 947. A *Tazetta* form.
 — — *jasmineus*. 1. White. April.
 — *patella'ris*. 1. White. May. A form of *N. poeticus*.
 — — *esse'rtus*. 1. White. May.
 — — *plenus*. 1. White. May.
 — *patulus*. 1. White. March. Spain.
 — — *albus*. 1. White. March. Spain.
 — *poculiflorus*. 1. Snow-white. April. Probably a hybrid. Syn., *N. montanus*. B. R. t. 123.
 — *poeticus*. 1. White. May. South Europe. Red. Lil. t. 160.
 — — *maja'lis*. White, edge of corona saffron.
 — — *patella'ris*. White, edge of corona saffron.
 — — *poetarum*. Corona yellowish. April.
 — *radiiflorus*. 1. White. March. South Europe. Syns., *N. angustifolius*, B. M. t. 193, and *N. majalis*.
 — — *recurvus*. 1. White. May. South Europe. Syn., *N. recurvus*. Swt. Fl. Gard. ser. 2, t. 188.

- N. poeticus stella'ris*. May. Syn., *N. stellaris*. Swt. Fl. Gard. ser. 2, t. 132.
- *verbane'nsis*. White, yellowish.
- *primuli'nus*. B. M. t. 1299. See *N. intermedium*.
- *pri'nceps*. A form of *N. Pseudo-narcissus*.
- *propi'nquus*. A variety of *N. Pseudo-narcissus*.
- *peu'do-junci'folius*. See *N. odorus*, var. *minor*.
- *Pseu'do-narci'ssus*. 1. Pale yellow. March. England. The Daffodil. Of this numerous varieties have been raised in gardens, the following being the chief.
- *bi'color*. Pure white; corona lemon yellow. *N. breviflorus*, B. M. t. 1187, and *N. Horsfieldii* are forms.
- *cyclami'neus*. Lemon and orange-yellow. Portugal. Syn., *N. cyclamineus*. B. M. t. 6950.
- *Johanni'ni*. Palesulphur. Portugal, 1887.
- *ma'jor*. Lemon-yellow. B. M. t. 51.
- *mi'nor*. Sulphur yellow; corona darker. Red. Lil. t. 480. Forms of this are *N. minimus*, *N. nanus* and *N. pumilus*.
- *moscha'tus*. 1. White. April. Western Europe. Syn., *N. moschatus*, B. M. t. 1300, and *N. candidissimus*, Red. Lil. t. 188. Forms of this are:—*N. albicans*, *N. cernuus*, Swt. Fl. Gard. ser. 2, t. 101, *N. longiflorus*, B. M. t. 924 and *N. tortuosus*.
- *pleni'ssimus*. 1. Yellow. March.
- *ple'nus*. 1. Yellow. March.
- *scoti'cus*. 1. Yellow. May. Scotland.
- *pulche'rillus*. 1. Yellow. April. Spain.
- *pu'milus*. A form of *N. Pseudo-narcissus*, var. *minor*.
- *radia'tus*. A form of *N. Tazetta*, var. *intermedium*.
- *recur'vus*. Swt. Fl. Gard. ser. 2, t. 188. See *N. poeticus*, var. *recurvus*.
- *rugilo'bus*. A form of *N. Pseudo-narcissus*, var. *intermedium*.
- *Sabi'ni*. 1. Yellow. April. B. R. t. 762. A hybrid.
- *scabe'rulus*. †. Yellow. Portugal. 1888.
- *semiparti'tus*. 1. Sulphur. March. A form of *N. incomparabilis*.
- *sero'tinus*. 1. Pure white; corona lemon-yellow. September. South Europe.
- *defici'ens*. Corona rudimentary. Syn., *N. deficiens*. B. R. 1847, t. 22, fig. 1.
- *e'legans*. 1. White, yellowish. September. Italy.
- *serra'tus*. †. Pale yellow. March. South Europe.
- *sua'vis*. Pale yellow. March. South Europe.
- *si'milis*. †. Yellow. April.
- *spu'rius*. A form of *N. Pseudo-narcissus*, var. *major*.
- *stella'ris*. Swt. Fl. Gard. ser. 2, t. 132. See *N. poeticus*, var. *stellaris*.
- *stria'tulus*. †. Yellow. April.
- *syri'acus*. White, yellow. Wien. Gart. Zeit. 1890, p. 362, fig. 80. A *Tazetta* form.
- *Taze'tta*. 1. March. Spain. 1759. Sibth. Fl. Gr. t. 358. The forms of this species are extremely numerous, and can be arranged in three groups thus:
- I. Perianth white; corona yellow.
- N. Cypri*, Swt. Fl. Gard. ser. 2, t. 92, *N. citrinus*, *N. floribundus*, *N. Trevianus*, B. M. t. 940, *N. ochroleucus*, B. M. t. 1298, *N. teretifolius*, Swt. Fl. Gard. ser. 2, t. 177.
- II. Perianth white; corona white.
- N. papyraceus*, B. M. t. 947, *N. dubius*, *N. canariensis*, *N. pachybolbos*, B. M. t. 6825.
- III. Perianth yellow; corona yellow.
- N. italicus*, B. M. t. 1188, *N. aureus*, *N. cupularis*, B. M. t. 925.
- N. Telamo'nus*. 1. Yellow. April. A form of *N. Pseudo-narcissus*.
- *grandiple'nus*. 1. Yellow. April.
- *ple'nus*. 1. Yellow. April.
- *te'nuior*. 1. White. May. 1789. B. M. t. 379. A form of *N. gracilis*.
- *Trewia'nus*. B. M. t. 940. A form of *N. Tazetta*.
- *tria'ndrus*. †. White. April. Portugal, 1629. Syns., *Ganymedes albus* and *Illus triandrus*.
- *calathi'nus*. Sulphur-yellow. Brittany. Red. Lil. t. 177.
- *cer'nuus*. Yellow. Syn., *N. triandrus* of B. M. t. 48.
- *co'ncolor*. Pale yellow. Syn., *Ganymedes concolor*. Swt. Fl. Gard. ser. 2, t. 113.
- *nu'tans*. Deep yellow. Syn., *N. trilobus*. B. M. t. 945.
- *pulche'rillus*. White, yellow. Syns., *N. triandrus*, var. *luteus*, B. M. t. 1262 and *Ganymedes pulchellus*, Swt. Fl. Gard. ser. 2, t. 99.
- *trilo'bus*. See *N. triandrus*, var. *nutans*.
- *tubiflo'rus*. 1. White, yellow. March.
- *variifo'rnis*. A form of *N. Pseudo-narcissus*.
- *Victo'rice*. Garden hybrid. 1891.
- *viridiflo'rus*. †. Greenish. September. Barbary. 1629. B. M. t. 1687.

Narcissus Fly. See Merodon.

Nardosta'chys. (From *nardos*, a sweet-scented shrub, and *stachys*, a spike. Nat. ord., *Valerianaceae*.)

Hardy perennial herb, said to be the spikenard of the ancients.

N. Jatama'nsi. 2. Pink. September. Himalayas. 1878. B. M. t. 6564.

Narthe'cium. (From *narthez*, a rod; referring to the flower-stems. Nat. ord., *Liliaceae*; Tribe, *Narthecieae*.)

Hardy herbaceous, Iris-like rushes, adapted for mixed borders of herbaceous plants. Divisions of the plant in spring; a cool border, and supplied with sandy peat, or sand and leaf-mould.

N. america'num. †. Yellow. July. N. Amer. 1811.

— *ossi'fragum*. †. Yellow. July. Britain.

Na'rthex. (From *narthez*, the Greek name of an umbelliferous plant. Nat. ord., *Umbelliferae*.) Now united with **Ferula**.

N. Assafoe'tida. B. M. t. 5168. See *Ferula Assafoetida*. This plant is one of those from which the well-known medicinal gum is obtained.

— *Polla'ki*. See *Dorema ammoniacum*.

Naso'nia. (From *naso*, a nose; the column and anther, together, somewhat resemble a nose. Nat. ord., *Orchideae*.) See **Centropetalum**.

N. cinnabari'na, B. M. t. 5718, and *N. puncta'ta*. See **Centropetalum punctatum**.

Nastu'rtium. (From *nasus*, the nose, and *tortus*, tormented; referring to the hot, acrid smell. Nat. ord., *Cruciferae*; Tribe, *Arabideae*. Allied to the Wallflower.)

Simple-looking plants, of no great beauty. We introduce the genus to correct the common error of calling the Indian Cress (*Tropaeolum*) Nasturtium. Hardy aquatics, with yellow

flowers, except *N. officinale*; seeds and division of the plant in common soil; but none are worth growing for their beauty. See WATER CRESS.

N. ainceps. 1. July. Britain.

— *erectum*. June. Siberia. 1837.

— *na'tans*. 4. July. Siberia. 1827.

— *officinale*. White. June. Britain. Water Cress.

Native oak. *Casuarina*.

Nau'clea. (From *naus*, a ship, and *kleio*, to inclose; the half-capsule, or seed-pod, in the form of a ship's hull. Nat. ord., *Rubiaceæ*; Tribe, *Naucleæ*. Allied to *Cinchona*.)

Stove evergreens, from the East Indies; cuttings of half-ripe shoots in sandy loam, under a glass, in heat; loam, sand, and peat. Usual stove temperatures.

N. Adina. See *Adina globiflora*.

— *Cada'mba*. 20. Orange. Bedd. Fl. Syl. t. 35.

— *cordiflora*. 40. Yellow. Bedd. Fl. Syl. t. 33.

Now included in *Adina*.

— *macrophylla*. Yellow. 1829.

— *orientalis*. 30. Yellow.

— *purpurea*. 10. Purple.

— *undulata*. 20. Yellow. 1820.

Naumbergia thyrsiflora. A synonym of **Lysimachia thyrsiflora**.

Nautilocalyx. (Nat. ord., *Gesneraceæ*; Tribe, *Cyrtandreeæ*.) See **Episcia**.

N. hastatus. A synonym of *Episcia bractescens*.

Navarre'ttia. (Named after a Spaniard. Nat. ord., *Polemoniaceæ*.) See **Gilia**.

N. cotulæfolia. See *Gilia cotulæfolia*.

— *eryngioides*. See *Gilia eryngioides*.

— *intertexta*. See *Gilia intertexta*.

— *pubescens*. See *Gilia pubescens*.

— *pungens*. See *Gilia pungens*.

— *squarrosa*. See *Gilia squarrosa*.

Navelwort. *Cotyledon*.

Navet, or Navew. (*Bra'ssica na'pus*.) The Colesat, or Rape.

Neapolitan Violet. *Viola odorata pallida plena*.

Nectarine. (*Persica la'vis*.) The following are the best varieties, and all require a south-aspect wall. We add the months in which the fruit ripens. *Hardwick Seedling*, August; *Ebruge*, August; *Violet hâtive*, August, September; *Late Newington*, September, October; *Pitmaston Orange*, September; *Humboldt*, August; *Rivers's white*, August, etc. For culture, see **Peach**.

Nectarosco'rdum. Honey Garlic. (From *nectar*, honey, and *skorodon*, garlic; referring to honey pores in the flower of this onion-like flower. Nat. ord., *Liliaceæ*; Tribe, *Alliææ*.) See **Allium**.

N. sc'culum. B. R. t. 1913. See **Allium Dioscorides**.

Nectou'xia. (Named after *M. Nectoux*, a German author. Nat. ord., *Solanaceæ*; Tribe, *Solanææ*. Allied to *Nicotiana*.)

Hardy herbaceous perennial. Division in spring; cuttings of shoots under a hand-light, in summer; rich, sandy loam.

N. formosa. 3. Yellow. July. Mexico. 1826.

Ne'ctria. A genus of minute Fungi, the best known species of which, *N. cinabari'na*, is of frequent occurrence on the branches of the Currant. It appears in the form of small knobs of a vermilion colour. On close examination these knobs will be found to be of two kinds, viz.: 1, Pale vermilion and smooth, which upon examination beneath a microscope will be found to consist of numerous slender filaments, at or near the tips of which are minute oblong bodies (*conidia*), which drop off and are capable of reproducing the plant. 2. Darker vermilion and rough. These also consist of numerous slender filaments, woven together and surrounding a cavity in each lobe, which communicates with the exterior by a minute pore. At the base of each cavity are numerous club-shaped cells, each containing eight spores, which escape on becoming mature, and also serve to reproduce the plant.

Ne'ctris pelta'ta. A synonym of **Cabomba aquatica**.

Needle furze. *Geni'sta anglica*.

Negro Fly. *Athalia*.

Negu'ndium americana'rum. A synonym of **Negundo aceroides**.

Negu'ndo. Box Elder. (Derivation is not known. Nat. ord., *Sapindaceæ*; Tribe, *Acerineæ*. Allied to the Maple.)

Hardy deciduous trees, with green flowers. Layers and seeds, which should be sown in autumn as soon as gathered; deep, moist, sandy loam. A short-lived tree, suitable for shrubberies and lawns.

N. aceroides. 40. May. North America. 1688.

Syns., *N. frazinifolium*, and *Negundium americanum*.

— *crispum*. 30. May. 1688.

— *laciniatum*. Leaves deeply cut.

— *variegatum*. Leaves variegated.

— *viola'ceum*. 30. May.

— *cissifolium*. 5-10. Japan. Syn., *Acer cissifolium*.

— *frazinifolium*. See *N. aceroides*.

— *niko'næe*. Japan. 1831.

Nei'llia. (After *Patrick Neill*, of Edinburgh. Nat. ord., *Rosaceæ*; Tribe, *Spirææ*. Syn., *Adenilenia*.)

Hardy shrubs, propagated by cuttings in sand under a bell-glass, or by seeds.

N. amurensis. 5. White. Summer. Amurland. Syn., *Spiræa amurensis*. Gfl. t. 489.

— *opulifolia*. 5. White. June. North America. 1690. Syn., *Spiræa opulifolia*.

- N. opulifolia aurea*. Leaves golden-yellow.
 — *rubifolia*. 6. White. Nepal.
 — *thyrsiflora*. 6. White. Nepal.
 — *Torre'sii*. 3. Rocky Mountains. G. and F.
 1889, ii. p. 4, fig. 84.

Ne'ja. (Probably the Mexican name. Nat. ord., *Compositæ*; Tribe, *Asteroidæc.*) United with *Hysterionica* in the Genera Plantarum.

A half-hardy herbaceous Composite, flowering in a bed or border from May to October. Seeds, divisions; common soil; protection in a pit in winter.

- N. gracilis*. 1. Yellow. Uruguay, not Mexico. 1828. Swt. Fl. Gard. ser. 2, t. 78. Syn., *Diplopappus stenophyllus*.

Neli'tris. (From *ne*, not, and *elytron*, a seed-case; referring to the berry having no partitions. Nat. ord., *Myrtacæ*; Tribe, *Myrtacæ*. Allied to the Pomegranate.)

Stove white-flowered, evergreen shrubs. Cuttings of half-ripened short shoots in sand, under a bell-glass, and in a gentle heat, in April or May; fibry loam, leaf-mould, peat, and sand, and a little charcoal to keep all open. Winter temp., 45° to 50°; summer, 60° to 85°.

- N. Jambosella*. 10. Society I. 1810.
 — *paniculata*. May. Moluccas. 1820.

Nelu'mbium. Water Bean. From *nelumbo*, the Indian name. Nat. ord., *Nymphaeacæ*; Tribe, *Nelumboneæc.*)

These handsome plants are natives of still waters. The nuts of all the species are eatable and wholesome; and the North American Indians eat the root-stocks of *lutium*, which are not unlike the sweet potato. Division of the root, either just before, but better still after, growth has commenced, and better still by seeds; fresh warm water must often be supplied when the plants are growing, removing some out of the tub, and placing more in; when at rest, the soil, rich loam, may be allowed to get quite dry. Temp., when at rest, 45° to 55°; when growing and approaching flowering, 70° to 95°.

- N. caespitum*. Pink. Caspian Sea. 1822. B. R. 1844, t. 14.
 — *flavescens*. Yellowish. June. Egypt. 1847.

 — *lutium*. Yellow. Carolina. 1810. B. M. t. 2753.
 — *speciosum*. Pink. July. India. 1787. B. M. t. 903.
 — — *roseum*. 3. Rose. June. India.
 — *Tamara*. Pink. Malabar. 1818.

Nema'stylis. (From *nema*, a thread, and *stylos*, a column; because of the slender style. Nat. ord., *Iridacæ*; Tribe, *Sisyrinchiacæ*.)

Half-hardy bulbs from N. America. For cultivation, see GLADIOLUS.

- N. acuta*. 3. Blue, yellow, black. California. 1875. B. M. t. 6666. Syn., *N. geminiflora*.
 — *caelestina*. 2. Bright blue. Florida and Carolina. Gf. t. 1081, fig. 1.

Nemata'nthus. (From *nema*, a thread, and *anthos*, a flower; the flowers of *longipes* hanging down from long, threadlike foot-stalks. Nat. ord., *Gesneracæ*; Tribe, *Cyrtandracæ*. Allied to *Columnæc.*)

Stove evergreen climber, of considerable beauty, easily managed, still easier to increase, and offering strong inducements to the cross-breeder. Cuttings in sandy soil, kept rather dry; leaves, also, will strike; sandy peat and turfy loam, with charcoal and dried cow-dung. Winter temp., 45° to 55°; summer, 60° to 85°.

- N. chloronema*. 1½. Scarlet. July. Organ Mountains. 1841. B. M. t. 4080.
 — *corticola*. Deep crimson. Tropical America. 1848. Syn., *N. ionema*. B. M. t. 4060.
 — *Guilleminia*. See *N. longipes*.
 — *ionema*. See *N. corticola*.
 — *longipes*. 2. Scarlet. December. Brazil. 1841. B. M. t. 4018. Syn., *N. Guilleminia*, *Columnæa grandiflora*, *C. longipedunculata* and *C. splendens*.

Nematoid Worms (*Anguillulidæc.*) A group of minute, thread-like worms, which attack the internal parts of many plants. Plants ascertained to be thus attacked should be burnt.

Nema'tus ribes'ii. The Gooseberry Saw-fly. See *Ribes*.

Neme'sia. (Name of a plant mentioned by Dioscorides. Nat. ord., *Scrophulariacæ*; Tribe, *Hemimeridæc.* Allied to *Hemimeris*.)

Natives of South Africa. Seeds sown in a slight holed in spring, and transplanted in May or June, or sown in May; the perennials, also, by divisions in spring, and by cuttings under a hand-light in summer; sandy loam; a cold pit, and dry in winter.

- ANNUALS.
N. bicornis. 2. Purple. July. 1774.
 — *floribunda*. 1. White, yellow. July. B. R. 1838, t. 39.
 — *linearis*. 1. Rose. April. 1822.

- HERBACEOUS.
N. chamaerifolia. 2. Purple. June. 1787.
 — *cynanchifolia*. 1. Blue, yellow. Natal. 1879.
 — *caetens*. 2. Purple. June. 1798.
 — *frutescens*. 2. Yellow. May. 1816. Evergreen.

Nemopa'nthes. (From *nemos*, a grove, and *anthos*, a flower; it being generally found in groves. Nat. ord., *Ulicinacæ*. Allied to *Prinos*.)

An ornamental, hardy, deciduous, upright-growing shrub, very little known in England, but very desirable. It was called *Ulex canadensis* and *Prinos integrifolius*. The flowers are small and white; but the berries are large, beautiful crimson, and very ornamental. Layers in autumn; seeds then, and in spring; common shrubby soil, but it will do better with an addition of sandy peat or leaf-mould.

- N. canadensis*. 3. May. N. Amer. 1812. Syn., *N. fascicularis*.

Nemo'phila. (From *nemos*, a grove, and *phileo*, to love; from their place of growth. Nat. ord., *Hydrophyllacæ*; Tribe, *Hydrophyllacæ*. Allied to *Hydrophyllum*.)

Like all the Californian annuals, well-adapted to be sown in September; the seedlings to stand over the winter, and be protected at times with evergreen houghs, to flower where sown, or to be raised in patches, and thus transplanted in

spring; sown thickly in March, on a rough, rich soil, consisting of leaf-mould, rotten dung, and coarse loam, laid on a hard bottom, protected by glass or mats, and transferred to the flower-garden in April and May. Sown in April and May, in the open border, they will flower most of the summer. A few grown in pots will ornament a house or window in winter and spring. A rich, light soil suits them best, and a moist, shady situation. In watering, avoid wetting the collar of the plant.

ANNUALS.

Nepe'nthes. Pitcher Plant. (From *nepenthes*, grief-assuaging; its supposed medicinal quality. Nat. ord., *Nepenthaceæ*.)

Stove evergreen climbers. Seeds, when they can be obtained, which require a strong, moist heat to vegetate in: but chiefly by little offsets, which come from near the base of the shoots; very fibry peat, old sphagnum, charcoal, and broken potsherds, particularly well-drained; the pot to be then plunged in moss, and at all times supplied, less or more, with bottom-heat and abundance of moisture. Where there are tanks or beds heated by hot water, one chief element to successful culture is obtained. Even in winter the bottom-heat should not be lower than 75°. Winter temp., 60° to 65°; summer, 60° to 90°.

- *Williamsii*. Pitchers green, with blood-red spots. Hybrid between *N. Sedeni* and *N. Hookeriana*. G. C. 1880, xiv. p. 40.
- *Wrightiana*. Pitchers pale green, with crimson spots. Hybrid. G. C. 1882, xvii. p. 143, fig. 23.

Nepeta. Cat Mint. (Named from *Nepet*, a town in Tuscany. Nat. ord., *Labiata*; Tribe, *Nepeteæ*. Allied to *Dracocephalum*.)

A genus of hardy herbaceous plants, comprehending a few ornamental, with a large number of weeds; the latter we have omitted. The Ground Ivy, *Nepeta glechoma*, is still held in high estimation as a pectoral medicine in some parts of the country, and also several others of this order. Seeds, sown in spring, but chiefly by dividing the plants in the spring as growth commences; also, in rare kinds, by cuttings in summer, under a hand-light; light, sandy soil; some of the more trailing kinds do well for rock-work.

Nephrospe'rma. (From *nephros*, a kidney, and *sperma*, a seed. Nat. ord., *Palmeæ*; Tribe, *Areceæ*.)

An elegant stove palm. Rich loamy soil. Seeds. *N. Va'n Houttea'na*. 25. Seychelles. 1868. Syns., *Areca nobilis* and *Oncosperma Van Houtteana*.

Nephty'tis. (After *Nephtys*, the wife of Typhon. Nat. ord., *Aroideæ*. Allied to *Richardia*.)

Stove aroids, requiring a hot, moist atmosphere, and light, rich soil.

- N. libe'rica*. Liberia. 1881.
 — *pictura'ta*. 2. Congo. 1887.

Neptu'nia. (After *Neptune*, the mythological deity of the sea; a water-plant. Nat. ord., *Leguminosæ*; Tribe, *Adenanthereæ*. Allied to *Desmanthus*.)

Stove water-plant, with pinnate, sensitive leaves like a *Mimosa*; seeds in strong heat; cuttings and divisions. Winter temp., 50° to 60°; summer, 60° to 90°.

- N. ple'na*. White, yellow. August. Mexico. 1733. B. M. t. 4695. Syn., *N. polyphylla*.

Nerine. (The daughter of *Nerius*, Nat. ord., *Amaryllidææ*; Tribe, *Amaryllææ*. Allied to *Brunsvigia*.)

Greenhouse bulbs, from South Africa, except when otherwise mentioned. The Guernsey lily is a *Nerine*, and, like it, all the species flower in the autumn—some before the growth of the leaves, and others with the leaves coming up. Like the *Amaryllis*, they grow from September to May, and delight in strong, yellow loam; a vigorous growth of the leaves is requisite to cause them to flower the following autumn. Many attempts have been made to cross them with *Amaryllis* and other allied genera without success; but they produce fine crosses among themselves. Seeds sown in heat, in spring, or as soon as ripe, but chiefly by offsets from the bulbs; rich, sandy loam, with a little peat; deeply planted, and a dry situation in winter; or protected in a cold pit or greenhouse, and kept dry until vegetation commences.

— *venu'sta*. See *N. sarniensis*, var. *venusta*.

Ne'rium. Oleander. (From *neros*, moist; referring to their native places of growth. Nat. ord., *Apocynaceæ*; Tribe, *Echitidææ*.)

Notwithstanding the beauty of the Oleander, it is one of the most virulent of vegetable poisons. Beautiful greenhouse plants, but which require a higher temperature to start them in the spring. Cuttings of shoots, getting firm, in sand, under a bell-glass, and kept warm; cuttings a little older do well in phials of water, also kept warm; peat and loam, enriched with cow-dung and leaf-mould. Winter temp., 35° to 48°; summer, 60° to 75°. The shoots made this season should bloom the next, if well ripened.

Ne'rtera. (From *nerteros*, lowly; in reference to the habit of the species. Nat. ord., *Rubiaceæ*; Tribe, *Anthospermeæ*. Allied to *Coprosma*.)

Hardy alpine perennial herb. The flowers are very insignificant, but when in fruit, and the berries are produced very freely, it is a very charming and attractive plant. Seeds; divisions. Light sandy loam.

- N. depr'essa*. One-twelfth. Green; berries orange. Antarctic Mountains. 1868. A charming rockwork plant. B. M. t. 5799.

Nesæ'a. (The name of a sea-nymph. Nat. ord., *Lythraceæ*; Tribe, *Lythreæ*. Syn., *Heimia*.)

Half-hardy evergreen shrubs, except *N. triflora*, which is an annual. Divisions in spring, as fresh growth commences; cuttings of young shoots in sandy soil, under a bell-glass; sandy loam and fibry peat. Winter temp., 45° to 55°; summer, 60° to 80°.

- N. myrtifo'ra*. 5. Yellow. South America. 1826. Syn., *Heimia myrtifolia*.

- *trifo'ra*. 2. Blue. August. Mauritius. 1802.

Nesopa'nax. (From *nesos*, an island, and *Panax*. Nat. ord., *Araliaceæ*.)

Small stove tree, with large digitate leaves on long stalks.

- N. vitie'nsis*. Green. Fiji Islands. 1887.

Netting is employed to prevent the radiation of heat from walls, and the

rude access of wind to trees grown upon them, as well as to prevent the ravages of birds.

Netting is a very effectual preventive of cooling, for reasons which will be stated when considering *Screens* generally; and in connection with that, it may be observed, that it is not altogether immaterial of what substance netting is formed. Worsted is to be preferred, not only because it is the most durable, but because it is the best preventive of a wall's cooling. We have found the thermometer under a hemp net sink, during the night, from 2° to 4° lower than that under a net of worsted, the meshes being small and of equal size in both nets. This can only be because worsted is known to be a worse conductor of heat than hemp; and, not absorbing moisture so easily, is not so liable to the cold always produced by its drying. Netting will also exclude flies and other winged insects from the fruit against walls, although the meshes are more than large enough to permit their passage. Why this is the case is not very apparent; but the netting is equally efficient in keeping similar insects from intruding into rooms if there are no cross lights. If there are windows on different sides of the room, and it is to be presumed, therefore, also in a green- or hot-house, nets would not be so efficient.

One hundred square yards of netting, according to some merchants' mode of measuring, will not cover more than fifty square yards of wall, for they stretch the net, first longitudinally, and then laterally, when making their measurement, and not in both directions at once, as the gardener must when covering his trees. Disappointment, therefore, should be avoided, when ordering new nets, by stating the size of the surface which has to be covered. This may be done without any fear of imposition.

Nettle-tree. *Celtis*.

Neuma'nnia. (Commemorative. Nat. ord., *Bixineæ*.)

N. arcuata. 3. Carmine, yellow. Andes of Columbia. 1886.
— *ni'gra*. Rev. Hort. 1881, p. 390. See *Pitcairnia*.

Neuro'dium. (From *neuros*, a nerve; the fronds being strongly veined. Nat. ord., *Filices—Polypodiaceæ*.)

Stove fern. See **FERNS**.
N. lanceolata. W. Indies.

Neurola'na. (From *neuros*, a nerve, and *laena*, a covering; the involucreal leaves are three nerved. Nat. ord., *Compositæ*; Tribe, *Helianthoideæ*.)

Warm greenhouse shrub. Loam, leaf-mould, and sand.

N. lobata. 2. Yellow. June. West Indies. Syn., *Calea lobata*, B. M. t. 1734.

Neviu'sa. (Derivation uncertain. Nat. ord., *Rosaceæ*; Tribe, *Spirææ*.)

N. alabamensis. White. May. Alabama. 1879. B. M. t. 6806.

Newbou'ldia. (In honour of the Rev. W. W. Newbould, an energetic British botanist. Nat. ord., *Bignoniaceæ*.)

A stove tree. Culture the same as for **TECOMA**.

N. laevis. Pale rose or purple. Tropical Africa. Syn., *Spathodea laevis*, B. M. t. 4537. Probably *Spathodea pentandra*, B. M. t. 3681, also belongs here.

New Jersey Tea. *Ceano'thus america'nus*.

New Zealand Flax. *Pho'rmium te'nax*.

New Zealand Spinach (*Tetrago'nia expan'sa*) is much admired as a substitute for summer spinach, being of more delicate flavour, and continues available the whole summer.

Sow, at the latter end of March, in the seed-vessel, as gathered in the preceding autumn, in a pot, and placed in a melon-frame. The seedlings to be pricked out while small singly into pots, to be kept under a frame without bottom-heat until the third week in May, or until the danger of frost is past. Plant in rows, in a rich, light soil, at three or four feet apart each way. Twenty plants will afford an abundant supply daily for a large family.

In five or six weeks after planting the young shoots may be gathered, these being pinched off. They are productive until a late period of the year, as they survive the frosts that kill nasturtiums and potatoes.

To obtain Seed.—A plantation must be made on a poorer soil, or kept back in a shady spot.

Nica'ndra. (After *Nicander*, who lived about 150 A.D., and wrote on medicine and plants. Nat. ord., *Solanaceæ*.)

Hardy annual herb. Seeds in the open border in April; the seedlings to be thinned out, when large enough, to a considerable distance apart. *N. physaloides*. 2-4. Blue. Autumn. Peru. 1759. B. M. t. 2458.

Nicker-tree. *Guilandina*.

Nicotia'na. Tobacco. (Named after *Nicot*, a French ambassador in Portugal, who first obtained seeds from a Dutch merchant. Nat. ord., *Solanaceæ*; Tribe, *Cestrineæ*.)

Tobacco was first introduced either from Tobago, in the West Indies, or Tobasco, in Mexico—hence the name. Shrubby and perennial kinds require the warm greenhouse in winter, and may be propagated by divisions and cuttings, and also freely by seeds; all the annuals are raised by seed sown in a hotbed, in March or April; seedlings pricked off, potted, and transplanted in rich soil towards the end of May, when the ornamental ones will adorn the flower-border, and the useful ones, such as *tabacum* and *macrophylla*, will yield their large leaves for fumigating purposes; *glauca* makes a fine appearance against a wall.

Nierembergia. (Named after J. E. Nieremberg, a Spanish Jesuit. Nat. ord., *Solanaceae*; Tribe, *Salpiglossideae*. Allied to *Petunia*.)

Pretty half-hardy plants for flower-beds. Cuttings root freely under a hand-light in summer, if kept shaded; and very freely in deep pits, in autumn, without shading, if the glass is from eighteen to twenty-four inches from the cuttings; and most freely in a slight hotbed in spring, from plants commencing to grow after being kept rather cool over the winter. Sandy loam and a little peat, and, when quick growth is wanted, a little cow-dung; kept in a cool greenhouse, or a dry, cold pit in winter, where frost can be excluded; the soil in winter should be poor, and kept rather dry; propagated, also, easily by sowing in a slight hotbed in March and April, potting and turning out the seedlings into the flower-garden in the middle of May.

Nightshade. *Solanum*.

Nightshade Enchanter's. *Circæa*.

Night-soil. See **Dung**.

Night Temperature in hothouses, greenhouses, and frames should always average from 10° to 20° lower than the temperature in which the plants are grown during the day. It is in the night that the individual functions are renovated by a temporary repose, and if left to the dictates of healthy nature, the sap, like the blood, rises at night with a much diminished velocity. That plants do become exhausted by too unremitting excitement, is proved to every gardener who has peach-houses under his rule; for if the greatest care be not taken to ripen the wood by exposure to the air and light during the summer, no peach-tree will be fruitful if forced during a second successive winter, but will require a much more increased temperature than at first to excite it even to any advance in vegetation.

The experiments of Harting and Munter upon vines growing in the open air, and those of Dr. Lindley upon vines in a hothouse, coincide in testifying that this tree grows most during the less light and cooler hours of the twenty-four; but the hours of total darkness

were the period when the vine grew slowest. This, observes Dr. Lindley, seems to show the danger of employing a high night temperature, which forces such plants into growing fast at a time when nature bids them repose.

That the elevation of temperature at night does hurtfully excite plants is proved by the fact, that the branch of a vine, kept at that period of the day in temperature not higher than 50°, inhales from one-sixteenth to one-tenth less oxygen than a similar branch of the same vine, during the same night, in a temperature of 75°. The exhalation of moisture and carbonic acid is also proportionably increased by the higher temperature.

Nipa. (The Moluccan name. Nat. ord., *Palmeæ*; Tribe, *Areceæ*.)

Stove palm. Seeds in a strong, moist heat, not giving too much moisture to the seed at first; rich loam. Winter temp., 60° to 65°; summer, 60° to 90°, and moist temperature.

N. fruticans. 10. White. E. Ind. 1822.

Niphæa. (From *niphos*, snow; flowers snow-white. Nat. ord., *Gesneraceæ*; Tribe, *Gesnerææ*. Allied to *Achimenes*.)

Stove herbaceous, white-flowered perennials. Divisions of the roots, as growth commences, in the spring; sandy loam and peat, enriched with leaf-mould or rotten cow-dung. Temp. when at rest, 40° to 45°; when starting and potted, 55° to 70°; when growing, 60° to 75°; when flowering, rather less; until after flowering they are allowed to become nearly dry, when a low temperature suits them.

 — *spicata*. 2½. 1786.

Nohl-kohl. See Knohl-kohl.

Noise'ttia. (Named after *L. C. Noisette*, a French nurseryman. Nat. ord., *Violaceæ*; Tribe, *Violaæ*. Allied to *Viola*.)

Stove evergreen. Cuttings of young shoots in April, in sand, under a glass, in heat; rich, sandy loam. Winter temp., 55°; summer, 60° to 85°.

N. longifolia. 1. Cream. Cayenne. 1824.

Nola'na. (From *nola*, a little bell; the form of the flowers. Nat. ord., *Convolvulaceæ*; Tribe, *Nolaneæ*.)

Hardy trailing annuals, nearly all blue-flowered. Seeds in a gentle hotbed, in spring; seedlings transplanted in May, or sown in May where they are to grow. A border where the soil is rather stiff answers well for sowing all

such plants in March, provided you can cover them with a little finer soil, and lay a glass frame over them, until they are fairly up, when they may be protected with a few branches, and then be removed in large patches.

- N. atriplicifolia*. ½. White, yellow. July. Peru. 1834. Swt. Fl. Gard. ser. 2, t. 305.
 — *grandiflora*. ½. July. Chili. 1829.

Nolina. (Named after *P. C. Nolin*, an American botanist. Nat. ord., *Liliaceæ*; Tribe, *Dracæneæ*. Allied to *Cordylina*.)

An interesting, hardy, peat-border bulb. Offsets and cuttings; sandy, moist peat.

- N. georgia'na*. 2½. White. July. Georgia. 1812. G. C. 1881, xv. p. 697, fig. 126.

Nonate'lia. (From the South American name. Nat. ord., *Rubiaceæ*; Tribe, *Psychotriææ*. Allied to *Guettardia*.) See **Palicourea**.

- N. lu'tea*. See *Palicourea lutea*.
 — *racemosa*. See *Palicourea racemosa*.
 — *violacea*. See *Palicourea violacea*.

No'nea. (After *J. P. Nonne*, a German botanical author. Nat. ord., *Boraginææ*.)

Hardy annual. For culture, see ANCHUSA.

- N. rosea*. ½-1. Rose, yellowish-white. Summer. Asia Minor. Syn., *Anchusa latifolia*.
 — — *versicolor*. Red changing to blue. Syn., *Anchusa versicolor*. B. M. t. 3477.

Nopa'lea. (From *Nopal*, the Mexican name. Nat. ord., *Cactææ*.)

Fleshy stove shrubs. Well drained soil, mixed with lime rubbish; plenty of sunlight. Cultivated as food for cochineal insects.

- N. coccinellifera*. 10. August. W. Indies. 1688. Syn., *Cactus cochinellifera*, Andr. Rep. t. 533 and *Opuntia coccinellifera*.

Nora'ntea. (From its Guianan name. Nat. ord., *Ternstroemiaceæ*; Tribe, *Margraviææ*.)

Handsome stove evergreen shrubs, remarkable for their singular bracts. Culture same as for **PALICOUREA**.

- N. brasiliensis*. 4. Brazil. 1820.
 — *guianensis*. 4. Violet. Guiana. 1818.
 — *indica*. White. Mauritius. 1822.

Nordma'nnia. (In honour of *M. Nordmann*, a continental botanist. Nat. ord., *Thymelacææ*; Tribe, *Erthymeleææ*.) United with **Daphnopsis** in the *Genera Plantarum*.

Hardy herbaceous plant; by division in early autumn or early spring; light loam.

- N. coraifolia*. ½. Blue. April. 1846.

Norfolk Island Pine. *Arauca'ria excelsa*.

Normandy Cress. See **American Cress**.

Norway Maple. *A'cer platanoi'des.*

Norway Spruce. *Pi'nus exce'l'sa.*

Notelæ'a. (From *notos*, south, and *elaia*, the Olive; literally, the Australian Olive. Nat. ord., *Oleaceæ*; Tribe, *Oleineæ*.)

All the species in this order will graft on each other, as the Lilac on the Ash, the Olive on the Privet and Phillyrea, and so forth. Greenhouse, white-flowered, evergreen shrubs, from Australia. Cuttings of firm, side, stubby shoots in April, in sand, under a bell-glass, without bottom-heat; peat and loam, with a little sand and charcoal. Winter temp., 40° to 50°.

N. longifo'lia. 3. April. 1790. Syn., *Olea apeta'la.* Andr. Rep. t. 316.
— *ova'ta.* 2. June. 1824.
— *puncta'ta.* 3. June. 1826.

Notholæ'na. Sometimes written **Nothochlæna** or **Nothoclæna.** (From *nothus*, spurious, and *chlaina*, a cloak; some of the species appearing to have an involucre. Nat. ord., *Filices*.)

Stove ferns, all but one with brown spores. See FERNS.

— *striat'u'm.* ½. White. S. America. Syn., *Allium striatum.* Hardy.

Noto'basis syr'aca. The Syrian Thistle.

Notospa'rtium. (From *notos*, southern, and *spartium*, Broom; a New Zealand plant resembling the broom. Nat. ord., *Leguminosæ*; Tribe, *Galegeæ*.)

Half-hardy or greenhouse shrub, resembling the Broom. Grows in peaty soil. Seeds.

N. Carmichaeliæ. 20. Pink. New Zealand. 1883. B. M. t. 6741.

Noty'lia. (From *notos*, the back, and *tylos*, a hump; referring to a singular lump on the column. Nat. ord., *Orchideæ*; Tribe, *Vandæ-Notyliciæ*. Allied to *Cirrheæ*.)

Stove orchids. For culture, see CIRRHÆA.

N. al'bidæ. ½. White. Spring. Central Amer. 1851.
— *Barkeri.* Straw. Mexico. 1837.
— *bi'color.* Lilac, greenish-white. Guatemala. 1866.

— *micra'ntha.* Pale green. Demerara.
— *puncta'ta.* ½. Yellow, green. Trinidad. 1822. B. R. t. 759. Syn., *Pleurothallis punctata.*
— *te'nuis.* Pale straw. Demerara. 1836.

Novæ'lia. (After *M. A. A. Nouel*, director of the Musée d'Orleans. Nat. ord., *Compositæ*.)

Half-hardy shrub, or small tree.

N. insi'gnis. White. Yunnan, China. Rev. Hort. 1889, p. 229, fig. 60.

Nunnezharia. This is an older name for the genus **Chamædorea**, but until it becomes more generally adopted we prefer to keep up the more familiar name of **Chamædorea**, under which the species are placed.

Nu'phar. (From *neufar*, the Arabic for water-lily. Nat. ord., *Nymphæacæ*; Tribe, *Nymphæacæ*.)

A beautiful family of hardy, yellow-flowered water-plants. Seeds merely thrown in the pond where it is desired to grow them, and propagated by divisions of the roots.

N. adve'na. July. N. Amer. 1772. Syn., *Nymphæa advena.* B. M. t. 684.
— *Kalmi'da'na.* See *N. pumila.*
— *hi'tea.* June. Britain. Eng. Bot. ed. 3, t. 54.
— *pu'mila.* July. Scotland. Syns., *N. Kalmiana* and *Nymphæa Kalmiana.* B. M. t. 1243.
— *sagittæfo'lia.* July. N. Amer. 1824.

Nursery, or Reserve Garden, is a garden, or portion of a garden, devoted to the rearing of trees, shrubs, and hardy plants, during their early stages of growth, before they are desired for the fruit or pleasure-grounds.

Nurseryman is one who raises fruit and ornamental trees and plants for sale.

Nutmeg. *Myristica*.

Nutta'lia. (Named in honour of *Thomas Nuttall*, a celebrated N. American botanist. Nat. ord., *Rosaceæ*; Tribe, *Prunææ*. Allied to *Spiræa*.)

Half-hardy shrub. Seeds, suckers, or cuttings in sandy loam under a hand-glass. Rich light soil. Needs protection from frost.

N. cerasif'ormis. 5. White. Early spring. California. 1848.

This must not be confounded with a genus of the same name, but belonging to *Malvaceæ*, which is now referred to **Callirhoe**, as follows:

N. corda'ta. B. R. t. 1938. See *Callirhoe tri-angulata*.

— *digita'ta*. B. M. t. 2612. See *Callirhoe digi-tata*.

— *grandif'ora*. Paxt. Mag. v. p. 217. See *Callirhoe digitata*.

— *Papa'ver*. B. M. t. 3287. See *Callirhoe Pa-paver*.

— *peda'ta*. See *Callirhoe pedata*.

Nut Tree. *Corylus*.

Nut Weevil. *Curcu'tio nucum*.

Nuy'tsia. Fire-tree. (Called after *T. Nuyts*, a Dutch navigator. Nat. ord., *Loranthaceæ*; Tribe, *Euloranthææ*.)

Very handsome shrubs, from Swan River, with such abundance of bright orange-coloured blossoms, that the colonists at King George's Sound compare it to a tree on fire; and it is also singular as being the only plant in this order of parasites which grows on the ground. Seeds; cuttings of firm side-shoots in May, in sand, under a bell-glass, and placed in a cold frame; sandy peat and fibry loam. Winter temp., 40° to 48°.

N. floribu'nda. 15. Orange. 1837. Syn., *Loranthus floribundus*.

— *liquistr'na*. Orange. 1837.

Nycta'nthes. (From *nyctos*, night, and *anthos*, a flower; the flowers open in the evening. Nat. ord., *Oleaceæ*; Tribe, *Jasmineææ*. Allied to *Jasminum*.)

This is the Hursingar of India, whose blossoms perfume the air at night, and cover the ground in the morning, when they are gathered and worn as necklaces, or in the hair of the native women. Stove evergreen shrub. Cuttings of half-ripened shoots in May, in sand, under a bell-glass, and in bottom-heat; sandy loam and fibry peat, kept open by sand and charcoal. Winter temp., 55° to 60°; summer, 70° to 90°. A most atmosphere when growing.

N. arbor tri'stis. 15. White. E. Ind. 1781. B. M. t. 4900.

Nycteri'nia. See *Zaluzianskia*.

Nycte'rium. See *Solanum*.

Nycto'calos. (From *nyx*, night, and *calos*, beautiful; because the handsome flowers of the first species discovered open in the evening and fade in the morning. Nat. ord., *Bignoniaceæ*.)

A handsome stove climber. For cultivation, see **BIGNONIA**.

N. Thoms'o'ni. Climber. White. Assam. 1868. B. M. t. 5678.

Nymphæa. Water-Lily. (From *nymphæ*, a water-nymph. Nat. ord., *Nymphæaceæ*; Tribe, *Nymphæææ*.)

All most beautiful water-plants: all like a rich, loamy soil, and plenty of water above it. Propagated by seeds, dividing the roots in some, and separating the tubers of others. The stove kinds should be kept cooler and drier in winter, and receive fresh soil before starting them in spring. They much delight in a supply of fresh-heated water when growing, and then the atmosphere can be scarcely too hot and moist. Temp. for stove kinds, winter, 48° to 55°; summer, 70° to 90°.

Ny'ssa. Tupelo-tree. (From *Nyssa*, a water-nymph. Nat. ord., *Cornaceæ*.)

Deciduous, green-flowered natives of the southern states of North America, where they attain the size of large trees, growing in watery places. They succeed best in peat swamps, and are highly deserving of cultivation, on account of their leaves dying off of an intensely deepscarlet; they are propagated from American seeds, also rather freely by layers; low, damp, moist situations suit them best. We are not aware that any seeds have been produced in England, as the male varieties only have bloomed, so far as we know.

O.

Oak. *Quercus*.

Oak-galls. Although the galls produced on British Oaks are exceedingly numerous, both in individuals and species, yet in general they seem to occasion very little harm to the trees, and we should not, therefore, mention them in this place, but for the fact that some few of the kinds are of such common occurrence as to be noticed by almost every observant person living in a neighbourhood where there are Oak trees; and gardeners and others frequently want to know something about

them. We therefore give a brief account of a few of the commonest species.

The large spongy gall, commonly known as the *Oak-apple*, or *King Charles's apple*, which is found upon the Oak about the middle of May, is produced by a small Hymenopterous insect named *Andricus terminalis*. The gall is somewhat spherical, and an inch or more in diameter; it is of a pale yellowish colour, tinged with rosy where exposed to the sun. The outer substance is of a soft, fungus-like nature; in the interior are a number of small oval larva-cells, in which the larvæ live and undergo their transformations, the perfect insects emerging at the end of May or beginning of June. After the gall-makers have left the gall, it is taken possession of by a great variety of other insects, some of which eat the spongy external substance; others live in the empty gall-cells that remain.

The *Silk-button gall*, so called from its resemblance to a small silk button, is produced on the under side of the leaf in July; usually several are congregated

together (Fig. 1). It forms a small disc, depressed in the centre, of a pale brown colour, clothed with silky hairs. Fig. 2 represents the gall in section, magnified, exposing the small central larva-cell. In October or November the galls fall to the ground, where they remain until February or March, when the perfect insect—*Neuroterus numismatis*—comes forth.

The *Oak-spangle* (represented at Fig. 3, on the lower part of the leaf, and in

section at Fig. 4, magnified) is a small disc-like gall with raised centre. In colour it is more or less reddish, and is covered with short hairs. This gall is produced by *Neuroterus lenticularis*, and, like the Silk-button gall, it falls to the ground in October, the perfect insect emerging in March.

The *Currant-gall* (Fig. 5) is a small globose gall, produced by *Spathogaster baccarum*, on the catkins and under side

of the leaves in May; it is green or reddish, translucent, and watery. About the middle of May or beginning of June the perfect insect comes forth (Fig. 6, magnified, the crossed lines beneath showing the natural size), and the galls shrivel up, unless tenanted by other insects. It has been stated by a German entomologist that the Oak-spangle gall, mentioned above, is produced by the second brood of *Spathogaster baccarum*, and although this is not at all improbable, it still requires confirmatory proof.

The *Marble* or *Devonshire gall* is so common, and so conspicuous from its large size, as to be well known to almost every one living in the country; we need therefore say nothing about it, beyond stating that it is caused by a brown Hymenopterous insect, named *Cynips Kollarî*.

Oat. *Ave'na*.

Obero'nia. (After the Fairy King, *Oberon*. Nat. ord., *Orchidæ*; Tribe, *Epidendrææ-Lipariææ*.)

Stove epiphytal orchids. For culture, see LIPARIS.

— *obtusata*. 4. E. Ind. 1790.

— *zeylanica*. A synonym of *Gomphia zeylanica*.

Ochra'nthe. (From *ochros*, pale yellow, and *anthos*, a flower. Nat. ord., *Cunoniaceæ*.) See **Turpinia**.

O. argu'ta. B. R. t. 1819. See **Turpinia**.

Ochroca'rpus. (From *ochros*, yellow, and *karpus*, fruit; the fruits are yellow. Nat. ord., *Guttiferæ*. Syn., *Calyssaccion*.)

Stove tree. Sandy loam. Cuttings of ripened wood in sand, under a bell-glass and kept moist.

O. africa'nus. 60. Greenish. W. Tropical Africa. 1823. Syn., *Mammea africana*

Ochro'ma. (From *ochros*, pale; referring to the flowers. Nat. ord., *Malvaceæ*; Tribe, *Bombaceæ*. Allied to *Cheirostemon*.)

The wood of *O. lago'pus* is so light that it is used in the West Indies for corks. Stove, white-flowered, evergreen trees. Cuttings of stubby, side, half-ripened shoots in sand, under a bell-glass, in heat; rich, sandy loam. Winter temp., 55° to 60°; summer, 60° to 85°.

O. lago'pus. 40. Jamaica. 1804.

— *tomentosa*. 20. S. America. 1816.

Ochro'pteris. (From *ochros*, pale, and *pteris*, a fern. Nat. ord., *Filices*.)

A beautiful stove fern, requiring a very moist, warm atmosphere. Peat, sand, and a little loam.

O. pa'llens. 4. Mauritius.

Ochro'sia. (From *ochros*, pale yellow. Nat. ord., *Apocynaceæ*; Tribe, *Plumeriææ*. Allied to *Cerbera*.)

Stove evergreen trees. Cuttings of half-ripened shoots; treatment similar to *Ochroma*.

O. borbo'nica. 10. Cream. Bourbon. 1828.

Syn., *Cerbera borbonica* and *C. undulata*. Andr. Rep. t. 130.

— *elliptica*. Yellow. Queensland.

— *maculata*. 4. White. June. Bourbon. 1782. Syn., *Cerbera maculata*. Perhaps the same as *O. borbonica*.

O'cium. Basil. (From *ozo*, a smell; the powerful odour of the plant. Nat. ord., *Labiataæ*; Tribe, *Ocimoideæ*. Syn., *Lumnitzera* of Jacquin.)

All but two are white-flowered; and most of

them require to be treated as tender and half-hardy annuals. To be sown in a slight hotbed, and transplanted afterwards; the border kinds sown where they are to grow, in warm places and light, rich soil, late in May. See *BASIL*.

 — *Wettoni*. A synonym of *Miltonia Warszewiczii*.
 — *Wendlandia'num*. Yellow, spotted with brown. New Grenada. 1889. G. C. 1889, vi. p. 7.
 — *Wilckea'num*. Whitish-yellow. Hybrid between *O. crispum* and *O. luteo-purpureum*. 1878. G. C. 1879, xii. p. 298. Syn., *O. hyroglossum* of G. C. 1882, xvii. p. 632, fig. 97.
 — *albens*. White, reddish-brown, yellow. Garden hybrid. Lind. t. 35.
 — *atro-purpureum*. Red, edged with yellow. Columbia. 1891. Syn., *O. Zaldua*.
 — *pa'llens*.
 — *pa'llidum*. Pale sulphur, brown. 1882.
 — *Rothschidia'num*. Yellow with reddish-brown blotches. Bogota. 1891. Rchb. ser. 2, i. t. 22.
 — *sulphureum*. Sulphur, red. G. C. 1884, xxi. p. 306.
 — *Williamstania'num*. See *O. grande*, var. *Williamstania'num*.
 — *Youngii*. Yellow, brown. Garden, xxxvii. p. 84. Warn. Orch. Alb. t. 406.
 — *Zaldua*. See *O. Wilckeanum*, var. *atro-purpureum*.

Odontoloma. (From *odous*, a tooth, and *loma*, an edge; fronds or leaves tooth-notched. Nat. ord., *Filices*.)

Stove ferns, with brownish-yellow spores. See FERNS.

- O. Borya'num*. May. Isle of Luzon.
 — *pulchellum*. May. Isle of Luzon.
 — *tenuifolium*. May. E. Ind.

Odontosoria. (From *odous*, a tooth, and *soros*, a leaf; allusive to the form of the sori. Nat. ord., *Filices*—*Polypodiaceae*.)

Stove ferns. See FERNS.

- O. aculeata*. W. Indies.
 — *tenuifolia*. Malay Archipelago.

Odontospermum. (From *odous*, a tooth, and *sperma*, a seed. Nat. ord., *Compositae*. Syn., *Asteriscus*.)

Hardy or greenhouse herbs, sometimes becoming shrubby. Seeds. Cuttings under a hand-light.

- O. aquaticum*. $\frac{1}{2}$. Yellow. July. S. Europe. 1731. Syn., *Euphthalmum aquaticum*. Hardy annual.
 — *maritimum*. Yellow. S. Europe. G. C. 1884, xxii. p. 392, fig. 70. Syn., *Asteriscus maritimus*.
 — *sericeum*. 4. Yellow. June. Canaries. 1779. Syn., *Euphthalmum sericeum*. B. M. t. 1836. Greenhouse evergreen shrub.
 — *stenophyllum*. 3. Yellow. June. Canaries. 1818. Syn., *Euphthalmum stenophyllum*. Greenhouse evergreen shrub.

Ceeco'clades. (From *oikeo*, to inhabit, and *klados*, a branch. Nat. ord., *Orchideae*; Tribe, *Vandee-Sarcantheae*.) In the Genera Plantarum the bulk of this genus is included in **Saccolabium**, the only species in cultivation, however, is referred to **Angræcum**.

Ce. falcata. See *Angræcum falcatum*.

Cedemo'ne. A synonym of **Herminiera**.

Cenocar'pus. (From *oinos*, wine, and *karpos*, a fruit; yields palm-wine and oil. Nat. ord., *Palmeae*; Tribe, *Areceae*. Allied to *Areca*.)

Stove palm. Seeds, but generally suckers; rich, loamy soil. Winter temp., 60°; summer, 60° to 90°.

- Ce. Bacaba*. 60. Para. 1849.
 — *Batana*. 40. S. Amer. 1820.
 — *caracasensis*. Venezuela. 1849.
 — *minora*. 10. Fruit blackish-purple.
 — *rubescens*. New Grenada. 1846.

Ceno'plea. (Nat. ord., *Rhamnaceae*.) A synonym of **Berchemia**.

Ce. lineata. See *Berchemia lineata*.

— *volvulifolia*. See *Berchemia volvulifolia*.

Ceno'thera. Evening Primrose. (From *oinos*, wine, and *thera*, imbibing; the roots of *biennis* supposed to be an incentive to drinking wine. Nat. ord., *Onagraceae*.)

Annuals and biennials, by seed in the open border, in April in light, rich soil; also in the autumn, to stand over the winter, and bloom early; perennials, by seeds also, by divisions of the plants in spring, and the more rare and tender by cuttings of the young shoots under a hand-light, in early summer.

HALF-HARDY.

- Ce. acutifolia*. $\frac{1}{2}$. White. July. Chili. 1821.
 — *Herbaceous*. B. R. t. 763.
 — *cheiranthifolia*. $\frac{1}{2}$. Yellow. July. Chili. 1823. Evergreen.
 — *Drummondii*. $\frac{1}{2}$. Yellow. August. Texas. 1833. Herbaceous. B. M. t. 3361.
 — *rosea*. 1. Pink. June. Peru. 1783. Herbaceous. B. M. t. 347.

HARDY HERBACEOUS.

- Ce. anisoloba*. 2. White. June. Chiloe. 1828. Swt. Fl. Gard. ser. 2, t. 105.

 — *triloba*. ½. Yellow. June. N. Amer. 1822. B. M. t. 2556. Perennial.
 — *vininea*. 2. Purple. July. California. 1826. B. M. t. 2873. Syn., *Godetia vininea*.
 — *vinosa*. 2. Blush. July. California. 1835. Syn., *Godetia vinosa*.
 — *virgata*. 1½. Purple, white. July. Peru. 1823.

Offsets are side bulbs produced by some bulbous roots, and by which the species can be propagated. Whatever checks the upward growth of the parent plant, as an early breaking down of the stem, compels the sap to find other organs for its reception, and, consequently, promotes the production of offsets. "The practice," says Dr. Lindley, "of scarring the centre of bulbs, the heads of Echino-cacti, and such plants, and the crown of the stem of species like *A'gave geminiflora*, in all which cases suckers are the result, is explicable on the foregoing principle."

O'ftia. (Derivation not explained. Nat. ord., *Myoporineae*. Syn., *Spielmannia*.)

Greenhouse evergreen shrub. Cuttings of young shoots in sand, under a bell-glass, at any time except winter; sandy loam and leaf-mould. Winter temp., 38° to 45°.

O. africa'na. 3. White. July. Cape of Good Hope. 1710. Syn., *Spielmannia africa'na*. B. M. t. 1839.

Ogechee Lime. *Nyssa candi'cans*.

Ohiggi'nsia. A synonym of **Hoffmannia**.

Ohlendo'rria. (In honour of Dr. C. F. Ohlendorff, of Holstein. Nat. ord., *Scrophulariaceæ*.)

Greenhouse undershrub. Sandy peat. Cuttings of half-ripened shoots; seeds.

O. procu'mbens. 2. Blue. August. South Africa. 1836. Syn., *Aptosimum depressum*. B. E. t. 1832.

O'idium. A group of minute fungi forming the "mildew" on some plants, c.g., *Oidium Chrysanthem*, on the *Chrysanthemum*. They consist of numerous interwoven filaments forming a white coating over the parts attacked. The ends of some of these filaments become erect, and divided by transverse partitions into spherical or barrel-shaped cells, which at length fall off and are capable of reproducing the *Oidium*. The investigation of the life history of some of the species has shown that reproductive bodies are also formed in special cells (*asci*) placed inside receptacles or *perithecia*. Other members of this group are:—*Erysiphe graminis*, on the leaves and stems of Grasses; *Oidium Tuckeri*, on grapes; *Sphaerotheca Castagnei* on Hops, etc. Being chiefly on the external parts of plants, they yield to the sulphur treatment.

Oil Nut. *Ricinus commu'nis*.

Oil Palm. *Elæ'is*.

O'lux. (From *olax*, furrowed; flowers partially furrowed, or imbricated. Nat. ord., *Olacineæ*; Tribe, *Olaceæ*.)

Stove, white-flowered, evergreen climbers, from the East Indies. Cuttings of ripened shoots in sand, under a bell-glass, in heat; sandy peat, fibry loam, and a little dried leaf-mould. Winter temp., 50° to 55°; summer, 60° to 80°.

O. imbrica'ta. 8. December. 1820.
— *sea'ndens*. 8. December. 1820.

Oldenla'ndia. (Named after H. B. Oldenland, a Danish plant-collector. Nat. ord., *Rubiaceæ*; Tribe, *Hedyotideæ*. Allied to *Hedyotis*.)

Slender stove or greenhouse shrubs. Cuttings of half-ripened shoots of *Deppia'na* in April, in sand, under a glass, in bottom-heat; peat and loam. Winter temp., 50° to 55°; summer, 60° to 85°. The annuals sow in a gentle hot-bed, in March; prick out the seedlings in the bed, and move them to the open border, after gradually hardening them, at the end of May.

O. cape'nsis. White. July. Cape of Good Hope. 1824. Annual.

— *corymbo'sa*. White. June. Jamaica. 1739. Annual.

— *Deppia'na*. 1. White. June. Mexico. 1835. Stove evergreen. Kn. and West, t. 1.

— *umbella'ta*. †. White. July. E. Ind. 1792.

Oldfie'ldia. (In honour of R. A. Oldfield, a merchant at Sierra Leone. Nat. ord., *Euphorbiaceæ*; Tribe, *Phyllanthheæ*.)

Stove evergreen tree. Cuttings under a bell-glass in heat. Sandy soil well drained.

O. africa'na. W. Africa. Its timber is believed to be the African Oak or Teak.

Old Man. *Artemi'sia abro'tanum* and *Kosmari'nus officina'lis*.

Old Man's Beard. *Cle'matis vi'ta'lba*, *Saxi'fraga sarmento'sa*, and *Til'la'ndsia usneo'ides*.

O'lea. Olive. (From *elaia*, the olive. Nat. ord., *Oleaceæ*; Tribe, *Oleineæ*.)

The Olive will graft on the Privet, Phillyrea, Ash, Lilac, and others of the order, Evergreens, all white-flowered, except *O. fra'grans*. Cuttings of ripened shoots in spring, in sand, under a hand-light, in a close frame or pit; also, when procurable, by seeds and grafting; loam and peat, of an open, fibry character. Winter temp., 38° to 48°. *O. sati'va* has stood for years against south walls near London. The scent of *fra'grans* is sufficient to perfume a large conservatory; where only one of the genus can be grown, this should be fixed upon.

HARDY EVERGREENS.

O. ilici'fo'lia. White. Japan.

GREENHOUSE EVERGREENS.

O. america'na. 6. June. N. Amer. 1758.

— *ape'tala*. Andr. Rep. t. 316. See *Natalœa longifolia*.

— *arbo'rea*. 20. August. 1825.

STOVE EVERGREENS.

O. dio'i'ca. 30. March. E. Ind. 1818.

— *la'ncea*. 20. August. Isle of France. 1819.

— *robu'sta*. June. Sylhet. 1824.

— *Roxburghia'na*. 15. August. E. Ind. 1820.

Oleander. *Ne'rïum*.

Olea'ndra. (The genus is founded on *O. nerifo'rmiss*, or oleander-like. Nat. ord., *Filices*.)

Stove ferns, with yellow spores. See FERNs.

- O. articulata*. June. India. 1837.
 — *Cumi'ngii*. June. Isle of Luzon.
 — *hirtella*. 1. Surinam.
 — *neriifolmis*. May. E. Ind.
 — *nodo'sa*. May. S. Amer. 1840.
 — *Walk'chii*. May. Nepaul.

Olea'ria. (From *olea*, an Olive-tree; because some of the species resemble the Olive-tree. Nat. ord., *Compositæ*; Tribe, *Asteroideæ*. Allied to *Aster*.)

Greenhouse or hardy ornamental evergreen shrubs. Seeds, or cuttings of the young shoots in spring, in a gentle heat. Sandy loam. Summer temp., 50° to 80°; winter, 40° to 55°. The genus *EURYBIA* is a synonym of this.

- O. alpi'na*. 6. White. May. New Zealand. 1851.

Olibanum. *Boswe'llia*.

Olive. *O'lea* and *Elæa'gnus*.

Olive-Bark-tree. *Terminalia Cata'ppa*.

Olive-Wood. *Elæode'ndron*.

Omala'nthus. See *Homalanthus*.

Omime Plant. *Plecta'nthus*.

Omphalo'bium. (From *omphalos*, the navel, and *lobus*, a pod. Nat. ord., *Connaraceæ*.) See *Connarus*.

The beautiful zebra-wood of the cabinet-makers is that of *O. africa'num*.

- O. africa'num*. See *Connarus africanus*.
 — *indicum*. See *Connarus monocarpus*.

Omphal'odes. Venus's Navelwort. (From *omphales*, the navel, and *eidos*, like; referring to the seed. Nat. ord., *Boraginææ*.)

Seeds of annuals in open border, in March, and once or twice more during the summer; the perennials, by division. *O. ve'rna* is a beautiful plant in the recesses of rock-works, in shady corners, thriving as well in shade as the interesting *Periwinkles*.

HARDY ANNUALS.

- O. interme'dia*. Blue. April. Arabia. 1836. Biennial.
 — *linifolia*. 1. White. July. Portugal. 1748.
 — *littora'lis*. 1. White. July. France. 1826.
 — *scorpioi'des*. 1. Blue. July. Bohemia. 1825.

HARDY HERBACEOUS.

- O. amplexicaul'is*. 1. White. July. Spain. 1823.
 — *Lucifolia*. Pink, changing to blue. Asia Minor. 1873. B. M. t. 6047.

 — — *alba*. White. March. 1884.

Onci'dium. (From *ogkos*, a tumour; referring to excrescences on the base of the lip, or labellum. Nat. ord., *Orchidææ*; Tribe, *Vandææ-Oncidiææ*. Allied to *Odontoglossum*.)

Stove orchids. Divisions as growth is commencing in spring; very shallow baskets suit all the largest-leaved kinds, or they may be fastened to a block of wood, placed across the mouth of a pot, the pot filled loosely with pieces of wood and charcoal, to insure perfect drainage, and then rotten wood, sphagnum, and fibry peat laid round the lower part of the plants, provided the base of the leaves is not covered. Hardy kinds, as *flexuosum*, require more packing;

small, tender kinds must be carefully treated, to prevent damping, especially when not growing. Winter temp., 58° to 65°; summer, 60° to 90°.

- O. acina'ceum*. Violet, white, carmine. Peru. 1866.
- *ac'milum*. Reddish-brown and yellowish-brown, violaceous. Columbia. 1872.

Oncocyclus. A synonym of **Iris**.

Oncosperma. (From *onkos*, a tumour, and *sperma*, a seed. Nat. ord., *Palmææ*; Tribe, *Areceæ*.)

Slender stove palms. For cultivation, see **ARECA**, to which it is allied.

- O. fascicula'tum*. Ceylon.
- *filamento'sum*. Java. 1847.
- *Van Houttei'num*. See *Nephrosperma Van Houtteanum*.

One-shift system of Potting is giving a plant in a pot *one large shift*, instead of frequent small ones. Thus, instead of moving a plant successively from a three to a five-inch pot, thence to a seven or an eight, and thence again to a ten or a twelve, allowing the roots to become matted at the sides of the pot, or merely to reach there, according as *flowering* or *growing* is the object aimed at, the plant is moved at once from a three, four, or five-inch pot into one of eight, twelve, or sixteen inches in diameter. It is seldom that a cutting, or a seedling, or a very small plant, is at once moved into a large one, as during its *very* small state it can be more safely, easily, and economically attended to in a small pot. The one-shift system requires room for its adoption. Striking individual, rather than mere general results are its characteristics; and, therefore, where a constant show of bloom and considerable variety in a small space are chiefly desired, it should only be sparingly adopted. The chief object aimed at is rapidity of growth, and thus obtaining a beautiful specimen in a much shorter period than could easily be realized by the succession-shift system. By the one-shift system we obtain a vigorous growth; but yet, from being in a pot, luxuriance may be so controlled as not to interfere with the flowering. In fact, with the extra care and trouble involved, we obtain the advantage without the disadvantages of the planting-out system. For the one-shift system, as well as in every other case where a fine specimen is desired, a young plant must be commenced with that has *never* had its roots matted round the pot. Such a plant will soon overtake one four times its size, but which has several times densely filled its pot with roots.

The freely-growing plants, and whose existence is short, are the best to commence with. Many of them are best managed upon this system. Wherever rapidity and strength of growth are an object, annuals intended to flower in pots, after being once pricked off into small pots or preparatory beds, and thus established, can scarcely be too soon afterwards transferred to their blooming pots. Where double flowers, as in the **Balsam**, or swelling-off part of the flower, as the **receptacle** in the case of the **Cockscomb**, are wished for, then different methods

may be adopted to secure a desired end. With such hard-wooded plants as Heaths and Epacris the most striking results are obtained by the one-shift system; but as greater care is necessary to success with such plants, we would advise young beginners to try some of the above soft-wooded plants in the first place, and to keep in view, for all the cases they may try, whether the plants are soft-wooded or hard.

In common with other modes of potting, *the pots* should be sound, fairly burned, dry, and either new or thoroughly clean, outside and inside. Secondly, *good drainage*—always essential—must here form a chief element of success. In all plants intended to remain in the same pot for years, it cannot be too particularly attended to. Green moss, or chopped wheat-straw, strewed over the drainage, is a good thing for preventing the earthy particles above being washed into and choking it up. Broken charcoal, from whence the dust has been extracted, is also very useful for this purpose. Indeed, larger pieces of charcoal may constitute the chief part of the drainage, which will be lighter than most things that could be used—a matter of considerable importance. On this account alone it is valuable for mixing with the compost to keep it open, independently of any chemical properties it may possess. Thirdly, *soil*. This, whatever may be its constituents, should be rough and lumpy; the bulk, in general cases, consisting of pieces from the size of peas up to that of beans and walnuts; and in cases of larger pots, a few pieces may be as large as hens' eggs. In such compost the plants will grow rapidly; and even in the case of Heaths, etc., they will maintain a healthy appearance for years. Should much of the compost be in *larger pieces*, the plant will not at all be greatly injured for the first season, or more, nor yet as long as the roots are contented to crawl around the surface of the lumps; but when they have reached the side of the pot, and necessity leads them to penetrate the large pieces, a declining appearance is apt to present itself. Hence the complaints against the system, that though plants grow vigorously at first, they were short-lived. Such large shifts, in the fine-sifted soil of old, could not succeed, unless in potted specimens that received more care than can, in general, be given to plants. Using huge lumps of loam or peat would tend to produce a similar evil, though from causes apparently different. The middle course is the safe one; but with rough soil, it is

necessary to surface with a little that is finer, that the air may not enter too freely. Fourthly. A plant never thrives well when the surface of the ball is sunk several inches below the rim of the pot; and there is something uncouth in observing the centre of the ball sticking up in the centre of the pot, like a mole-hill. In all cases, therefore, but especially where it is intended for a plant to continue for years, the compost should be pressed firmly before the young plant is set in the centre of the pot; and as, nevertheless, it will gradually sink a little, the surface of the old soil may just be a little below the rim of the pot. If the roots are the least matted, they should now be gently disentangled, and packed carefully with the hand in layers, putting the finest of the rough soil over the young rootlets, and the coarser towards the outside, next the side of the pot, and squeezing all rather firmly together with the hand, taking care, however, that the soil is in that happy medium that may be termed neither dry nor wet, and yet sufficiently *heated* to occasion no immediate check by cold. Fifthly. *Watering* is the most important of all points, and, where it cannot be properly attended to, the one-shift system should not be attempted. For some time you must merely water as far as the roots extend—the unappropriated soil must not be *soaked*, or it will become *sour* and unhealthy for the roots even before they get to it. No regular routine dash or dribble from the water-pot will do with the one-shift system. Sixthly. *Temperature*. On this system, for some time after potting, the plants should have from 5° to 10° more heat than they otherwise would require, and a close atmosphere until fresh growth is proceeding freely. A dash from the syringe frequently, in hot days, will be of great importance. Every incitement to growth must thus be given; and, when that has been accomplished, then air must be freely imparted, and a drier atmosphere maintained, that the fresh wood so freely made may be thoroughly matured. Seventhly. *Time of Potting*. Upon this system, in the case of all lasting plants intended to be our companions for years, this should take place in spring and early summer, in order, first, that growth may be quickly made, and then maturation of the wood be effected before the dark days come, when, in the generality of cases, the low temperature of winter will give them the *rest* they require before breaking and flowering vigorously and profusely the following season.

Onion. *Allium Cepa.*

Soil, rich, open, and well drained, in a situation entirely free from trees; if the soil be poor, abundance of dung should be applied in the preceding autumn or winter. Sea-sand, particularly if the ground is at all tenacious, is advantageously employed; coal-ashes, and especially soot, are applied with particular benefit. In digging over the ground, small spits only should be turned over at a time, that the texture may be well broken and pulverized.

Varieties.—1, Silver-skinned Onion, hardiest; 2, Early Silver-skinned; 3, True Portugal; 4, Spanish; 5, Strasburg; 6, Deptford; 7, Globe (white or red), best; 8, James's Keeping Onion; 9, Pale Red; 10, Yellow; 11, Blood-red; 12, Tripoli; 13, Two-bladed; 14, Lisbon; 15, Weathersfield red; 16, Yellow Danvers; 17, Welsh Onion; 18, Queen; 19, White Globe, etc.

Sow for the main crop during March. Main crops may even be inserted as late as the beginning of April, and at its close a small sowing to draw young in summer, and for small bulbs to pickle; again in July and early in August, for salads in autumn; and finally in the last week of August, or early in September, to stand the winter, for spring and beginning of summer. Sow thinly in drills, eight inches apart. An ounce of seed is sufficient for a rood of ground, especially for the main crops, as they should never be allowed to grow to a size fit for salads without thinning. The beds should be about four feet wide, for the convenience of cultivation.

Cultivation.—In about six weeks after sowing, the plants will be of sufficient size to allow the first thinning and small hoeing, by which they are to be set out about two inches apart. If this is performed in dry weather it will keep the beds free from weeds for six weeks longer, when they must be hoed a second time, and thinned to four inches apart; and now, where they have failed, the vacancies may be filled up by transplanting there some of those thinned out. The best time for doing this is in the evening, and water must be given for several successive nights. In transplanting, the root only is to be inserted, and no part of the stem buried. No plant is more benefited by liquid-manure being given twice a week. After the lapse of another month they must be thoroughly gone over for the last time, and the plants thinned to six inches asunder. After this they require only occasionally the stirring of the surface, which the hoe effects. In

order to prevent their running too much to blade, it is a good practice, in July, before the tips change to a yellow hue, to bend the stems down flat upon the bed, which not only prevents it, but causes the bulbs to become much larger than they otherwise would. The bend should be made about two inches up the neck.

Storing.—About the close of August the onions will have arrived at their full growth, which may be known by the withering of the foliage, by the shrinking of the necks, and by the ease with which they may be pulled up. As soon as these symptoms appear, they must be taken up, the bed being frequently looked over: for if the whole crop is waited for, the forwardest, especially in moist situations or seasons, are apt again to strike root.

Spread on mats in the sun, frequently turn, and remove under shelter at night. In two or three weeks, when the roots and blades are perfectly withered, and the bulbs become firm, they are fit for storing, being housed in dry weather, and carefully preserved from bruising. Previously to doing this, all soil and refuse must be removed from them; for these are apt to induce decay: to prevent this as much as possible, all faulty ones should be rejected. In the store-house they must be laid as thin as may be, or hung up in ropes, and looked over at least once a month. To preserve some from sprouting, for late use, it is useful to sear the roots and the summits with a hot iron, care being taken not to scorch the bulb.

Additional Modes of Cultivation.—For the winter-standing crop the only additional directions necessary are to tread in the seed regularly before raking, if the soil, as it ought to be, is dry and light. They must be kept constantly clear of weeds, as well as of the fallen leaves of trees, but they need not be thinned. Early in spring they are to be transplanted for bulbing. Sow in May. Cultivate the plants as in the other crops; and in October the bulbs, being of the size of nuts, are to be taken up, dried, and housed, as directed for the full-grown bulbs. About the middle of the following March they must be planted out in rows, six inches apart each way, and cultivated the same as the other crops. If sown earlier than May they run to seed when transplanted. Another mode, nearly as efficacious, is to sow in the latter part of August, to stand the winter, and in March, early or late, according to the forward growth of the

seedlings, to be planted out in rows at the before-directed distance, and cultivated as usual.

In Portugal they sow in a moderate hotbed during November or December, in a warm situation, with a few inches of mould upon it; and the plants are protected from frost by hoops and mats. In April or May, when of the size of a swan's quill, they are transplanted into a light, rich loam, well manured with old-rotten dung, to bulb. Transplanting alone is of great benefit.

To save Seed, some old onions must be planted early in March, the finest and firmest bulbs being selected, and planted in rows ten inches apart each way, either in drills or by a blunt-ended dibble, the soil to be rather poorer, if it differs at all from that in which they are cultivated for bulbing. They must be buried so deep that the mould just covers the crown. If grown in large quantities, a path must be left two feet wide between every three or four rows, to allow the necessary cultivation. They must be kept thoroughly clear from weeds, and, when in flower, have stakes driven at intervals of five or six feet on each side of every two rows, to which a string is to be fastened throughout the whole length, a few inches below the heads, to serve as a support, and prevent their being broken down. The seeds are ripe in August, which is intimated by the husks becoming brownish; the heads must then be immediately cut, otherwise the receptacles will open and shed their contents. Being spread on cloths in the sun, they soon become perfectly dry, when the seed may be rubbed out, cleaned of the chaff, and, after remaining another day or two, finally stored. It is of the utmost consequences to employ seed of not more than one year old, otherwise scarcely one in fifty will vegetate. The goodness of seed may be easily discovered by forcing a little of it in a hotbed or warm water a day before it is employed; a small white point will soon protrude if it is fertile.

Onion-fly. See *Phorbia cepeto-*
rum and *Eume rus cæneus*.

Oniscus. *O. asellus*, *O. armadillo*, Woodlice. The first is most easily distinguished from the second by its not rolling up in a globular form when at rest. They are found in old, dry dung-hills, cucumber-frames, etc., and they are injurious to many plants, fruits, etc., by gnawing off the outer skin. Gaslime will expel them from their haunts, and two boards or tiles kept one-eighth of an inch apart form an excellent trap.

Onobroma. (From *onos*, the ass, and *broma*, food. Nat. ord., *Compositæ*; Tribe, *Cynaroidææ*. Allied to *Carthamus*.)

Cuttings and divisions, and seeds of perennials; annuals, by seed; common soil; *arborescens* requires the protection of a cool greenhouse in winter.

- O. arborescens*. 6. Yellow. July. Spain. 1731. Evergreen.
— *cæruleum*. 1. Blue. June. Spain. 1640. Herbaceous.
— *cynaroides*. 2. White. June. Caucasus. 1820. Herbaceous.

Onoclea. (*Onoclea* was the Greek name of a plant. Nat. ord., *Filices*.)

Hardy ferns. See FERNS.

- O. nuda*. See *Lomaria nuda*.
— *obtusiloba*. 1. Brown. July. N. Amer. 1812. B. C. t. 1578.
— *sensibilis*. 1½. Brown. August. Virginia. 1799.

Ononis. Restharrow. (From *onos*, an ass, and *onemi*, to delight; the ass delights to browse on the herbage. Nat. ord., *Leguminosæ*; Tribe, *Trifoliææ*. Allied to *Trigonella*.)

Annuals, by seeds in April, in sandy, deep soil; perennials and creeping shrubs, by division in spring, and cuttings under a hand-light, in sand, in summer; deep, sandy loam for most of them.

Hardy under-shrub kinds, if of a creeping nature, answer well for rock-works. The tenderer species require a cold pit or a cool greenhouse in winter, and most of these like a little peat added to the sandy loam.

- *reticulatum.* 1. Tropics. Stove.
- *vulgatum.* ½. Britain.—Adder's Tongue.

Ophiopogon. (From *ophis*, a serpent, and *pogon*, a beard. Nat. ord., *Hæmodoraceae* ; Tribe, *Ophiopogoneae*.)

Herbaceous, white-flowered perennials, except where otherwise mentioned. Division of the plant at the roots, in spring, as vegetation is commencing ; also by seed ; sandy loam and a little peat. All are hardy in dry, sheltered places, except *O. prolifer*, which requires the protection of a greenhouse.

- O. intermedium.* See *O. japonicus*, var. *intermedium*.
- *Jaburan.* 1. July. Japan. 1830. B. C. t. 1876.

O. Jaburan variegatus. Violet ; leaves white-edged. Japan. 1863.

- *japonicus.* 1½. Lilac, yellow. June. Japan. 1784. B. M. t. 1063.
- — *argenteo-marginatus.* White ; leaves white-edged.
- — *intermedium.* 1½. Lilac. Autumn. China. 1821. Syns., *O. intermedium* and *O. spicatus* of Don.
- *prolifer.* 1½. July. Penang. 1844.
- *spicatus* of Don is *O. japonicus*, var. *intermedium* ; of Ker is *Liriope graminifolia*.

Ophiop'teris. (From *ophis*, a serpent, and *pteris*, a fern ; referring to the flexuose, creeping rhizome. Nat. ord., *Filices*.) A synonym of **Oleandra**.

O. verticillata. A synonym of *Oleandra neritiformis*.

Ophioxylon. (From *ophis*, a serpent, and *xylon*, wood ; referring to its twisted roots. Nat. ord., *Apocynaceae* ; Tribe, *Plumeriaceae*.) See **Rauwolfia**.

- O. majus.* See *Rauwolfia majus*.
- *serpentinum.* See *Rauwolfia serpentina*.

O'phrys. (From *ophrys*, eyebrows ; referring to the fringe of the inner sepals. Nat. ord., *Orchideae* ; Tribe, *Ophrydeae*—*Serapieae*.)

Elegant little ground-orchids, chiefly natives of Europe, but difficult to keep alive under cultivation. Division of the tuberous-like roots ; also, most of the hardy ones by seed, which should be sown as soon as ripe, or permitted to sow itself by falling on loose, damp moss, whence it may be moved, and finally planted after growth has taken place. *Apifera* prefers rich, heavy soil ; most of the others, sandy, chalky loam, and a little peat. Considering their interesting appearance, they well deserve a frame or cold pit from amateurs, so that they might receive similar attention to small alpinists.

- Opuntia.** Indian Fig. (A Latin name, of which the derivation is not applicable to the species now placed under it. Nat. ord., *Cactaceae*; Tribe, *Opuntiaceae*.)
 Greenhouse evergreen succulents, with yellow flowers, when not otherwise mentioned. Cuttings, by taking pieces off at the joints, and drying them a little before inserting them in sandy loam, and giving them a brisk bottom-heat. The great point is to give them a high temperature and a moist atmosphere when growing in summer, say from 65° to 85° or 90°; to reduce the moisture gradually as autumn approaches, but not the temperature, until autumn is on the wane; and then to keep them in a low temperature (40° or 50°), and dry during the winter; sandy loam, fibry peat, each one part; lime-rubbish, cow-dung, and charcoal, one-third part each. *Vulgaris* has stood in dry situations out of doors near London, and has been unhurt when planted at the foot of a wall, and wet excluded during winter. All species of which we know nothing but the names have been omitted.

Orach. (*Atriplex hortensis*.) This is cooked and eaten in the same manner as spinach, to which it is much preferred by many persons, although it belongs to a tribe whose wholesomeness is very suspicious.

Soil.—It flourishes best in a rich, moist soil, and in an open situation.

Sow about the end of September, and again in the spring for succession, in drills six inches apart. When the seedlings are about an inch high, thin to six inches apart, and those removed may be planted out at the same distance in a similar situation, and watered occasionally until established. For early production sow in a moderate hotbed at the same time as those in the open ground. The leaves must be gathered for use whilst young, otherwise they become stringy and worthless.

To save Seed.—Some plants of the spring sowing must be left ungathered from, and thinned to about eight inches apart. The seeds ripen about the end of August, when the plants must be pulled up, and, when perfectly dry, the seed rubbed out for use.

Orange. (*Citrus aurantium*.) See **Citrus**.

Orange Thorn. *Citriobatus*.

Orania. (From *ouranos*, heaven. Nat. ord., *Palmeæ*; Tribe, *Areceæ*.)

Tall stove palms. For cultivation, see PHENIX.

O. macrocledus 40. Malacca. 1847.

— *no'va*. Leaves white beneath.

— *porphyrocarpa*. Java. 1847.

— *regalis*. 7. Java. 1847.

Orbe'a. A synonym of **Stapelia**.

Orchard is an inclosure devoted to the cultivation of hardy fruit-trees. With respect to the situation and aspect for an orchard, avoid very low, damp situations as much as the nature of the place will admit, for in very wet soils no fruit-trees will prosper, nor the fruit be fine; but a moderately low situation, free from copious wet, may be more eligible than an elevated ground, as being less exposed to tempestuous winds; though a situation having a small declivity is very desirable, especially if its aspect incline towards the east, south-east, or south, which are rather more

eligible than a westerly aspect; but a north aspect is the worst of all for an orchard, unless particularly compensated by the peculiar temperament or good quality of the soil. Any common field or pasture that produces good crops of corn, grass, or kitchen-garden vegetables is suitable for an orchard; if it should prove of a loamy nature, it will be a particular advantage. Any soil, however, of a good quality, not too light and dry, nor too heavy, stubborn, or wet, but of a medium nature, friable and open, with not less than one spade deep of good staple, will be proper.

Drain thoroughly, and trench before planting. Plant in October, or, at the latest, in November. Trees will succeed if planted later; but those are the best months. Plant on stations (See **Stations**); and the following is a good selection:—Of *Apples*, plant for *Kitchen use* Keswick Codling, Mank's Codling, Blenheim Pippin, Dumelow's Seedling, Minshall Crab, Bedfordshire Foundling, Norfolk Beaufin, Hawthornden, Herefordshire Pearmain, King of Pippins, and John Apple. For *Dessert*: Early Harvest, Early Red Margaret, Kerry Pippin, Early Nonpareil, Pitmaston, Pearson's Plate, Ribston Pippin, Ross Nonpareil, Old Nonpareil, Lamb-Abbey Pearmain, Sturmer Pippin, and Court Pendu Plat. Of *Cherries*: Early Purple Griotte, Early May Duke, Black Eagle, Elton, Bigarreau, Florence, Late Duke, Morello, and Butner's October Morello. Of *Plums*: Précoce de Tours, Morocco, Orleans, Drap d'Or, Greengage, Royal Hâtive, Reine Claude Violette, Coe's Golden Drop, St. Martin's Quetsche, Washington, Jefferson, Winesour, Magnum Bonum, St. Catherine, and Ixworth Impératrice. In the preceding lists we have named the varieties in their order of ripening; but in this of *Pears* the months named are those in which the fruit is ripe. *July*, Doyenne d'Été. *August*, Benoist. *September*, Williams' Bon Chrétien, Beurré d'Amalis, Jalouse de Fontenay Vender. *October*, Duchesse d'Orleans, Marie Louise, Fondante d'Automne. *November*, Beurré Bosc, Thompson's, Doyenne Gris, Urbaniste. *December*, Hacon's Incomparable, Triomphe de Jodoigne. *January*, Beurré Langelier, Knight's Monarch. *February*, Inconnue Van Mons, Susette de Bavay, Duchesse de Mars. *March*, Beurré Bretonneau. *April*, Fortunée Parmentier, Bergamottée d'Esperen.

Orchard House. This is the name now applied to cheap glazed structures,

in which to grow hardy fruits in pots, and planted in the borders.

We have found that such a greenhouse, without any heating apparatus, is most useful, not only for growing Grapes, Peaches, Nectarines, and Apricots, but early Peas, Radishes, Strawberries, Lettuces, small Salading, and Potatoes. Such a structure is the following, described by Mr. Rivers, in his highly useful work, "The Orchard House."

We will suppose that an orchard house thirty feet long is required. A ground plan, thirty feet long and twelve feet wide, must be marked out, ten posts or studs of good yellow deal, four inches by three, and nine feet in length, or if larch poles, sixteen inches in girth, can be procured, they are quite equal in durability; these latter must be cut in two, and the flat sides placed outwards; these posts, or studs, whether larch or deal, must be fixed two feet in the ground firmly, and the ground ends must be charred two feet four inches from the bottom, which adds much to their durability: it will thus be seen that this, the back line of studs, will stand seven feet in height clear from the surface. For the front wall, ten studs, four feet long, must be inserted in the ground one and a half feet, so that they stand two feet six inches clear from the surface; on these studs, both at front and back, must be nailed a plate four inches by two and a half, on which the rafters are to rest; the studs are thus far arranged in two lines. Now, then, for the rafters: these must be fourteen feet long, and four inches by two in thickness, placed with the narrow surface upwards, to spare the trouble of "ploughing," to make the rebate for the glass, which is great labour and waste of material. On the upper side of each rafter, exactly in the centre, must be nailed a slip of half-inch board, three-quarters of an inch wide; this will leave half an inch and one-eighth on each side for the glass to rest on—not too much when the width of the glass is given. We have thus the rafters so far prepared for glazing, but not yet fitted on the plates at top and bottom: they must never be mortised, but let in at top by cutting out a piece, and sloped off at bottom.

To receive the glass at the top of the rafters, a piece of three-quarter-inch deal board, six inches wide, must be nailed along the top to the end of each rafter, so as to be even with the surface, and in this should be a groove to receive the

upper end of each piece of glass; at the bottom, a piece of board, one inch thick and six inches wide, must be let in for the glass to rest on, and to carry off the water. We have thus so far a sloping roof, seven feet three inches (with the plate) high at back, and two feet nine inches high in front; but the glass is not yet in. The most economical glass is sixteen-ounce British sheet, which can be bought at $2\frac{1}{2}d.$ or $3d.$ per foot, and the best size twenty inches by twelve; putting the laps, as it prevents breakage by frost; placing it cross-wise, so that the rafters must be *about twenty inches asunder*. On and outside the back studs, half-inch boards must be nailed, well seasoned, so that they do not shrink too much; these must be painted white. In the back wall, sliding shutters, two feet six inches by one foot, in grooves, must be fixed, for complete ventilation; two close to the roof, and two about eighteen inches from it.

The front must have, also, half-inch boards nailed on outside the studs; one of them, the upper one, to be on hinges, so as to let down the whole length of the house; these, when all open in hot weather, ventilate thoroughly. To add to this (and it is all required in summer), the boards will shrink and let in air; a fierce sunlight is thus admitted by the large glass, and abundance of air, in which all fruit-trees thrive to admiration. So much for the timber and glass; but when one sees that to walk along the centre of the building, which is about four feet nine inches in height, a person must be of very diminutive stature, the inquiry arises, How is head-room to be made? How simple is the answer! Make a trench two feet six inches wide, and two feet deep, in the centre of the ground plan; this will leave a border on each side four feet nine inches wide. The bottom of this trench forms the footpath; its sides must be supported with boards, or with four-inch brickwork. Now, as everything depends on these borders—for there must be no benches and no shelves—care must be taken to make their surface loose and open: loose materials, such as coarse cinders, lime-rubbish from old walls, or bricks broken into pieces in size from a nut to a walnut, may be laid on them about four inches deep; they may then be forked over to about nine inches in depth, well mixing the above materials with the soil; you thus have two borders not too far from the glass, and *on* which your trees will thrive admirably. It will appear odd to read about trees

thriving *on* instead of *in* a border; but when explained that this is to be an orchard in pots, it will not seem so contrary to our usual garden-culture.

Orchids. Amongst orchids are to be found flowers presenting a most striking contrast in general appearance, from the small green, inconspicuous ones of *Hermidium monorchis* to the large, richly coloured forms of *Cattleya labiata*, and yet all these can be referred to one type, so natural is the order. Each flower consists of a perianth of six segments arranged in two circles or whorls, each consisting of three members. The outer three are most frequently alike in shape, size, and colour. Of the three inner two are alike, but the third (originally superior, but at length inferior through the torsion of the ovary) is very different, generally much larger, often spurred, and differently, if not more brightly coloured, and is known as the lip or labellum. Rarely are the six perianth segments similar, except in a few Australian genera. Of the stamens only one is developed, except in the tribe *Cypripediæ*, where there are two. The stamen is adnate with the style to form the column. The pollen is usually waxy, and united into definite masses (pollinia), and escapes either by the falling off of a cap or operculum, or by longitudinal slits. On the face of the column opposite to the labellum are to be found the two united viscid stigmas, the third forms a special organ (rostellum) at the base of the anther. The ovary is inferior, one-celled with numerous ovules on three parietal placentas.

In no other order is the connection between the shape of the flower and its fertilization by insects so apparent as in orchids. For a full account of this the reader is referred to Darwin's "Fertilization of Orchids."

In Hooker and Bentham's *Genera Plantarum* the genera of Orchids are arranged in five tribes, characterized as follows:

1. **EPIDENDRÆÆ.** Anther 1, posterior, operculate, cells distinct, parallel. Pollinia waxy, one to four in each cell, in one or two rows, free, or those in each cell united by viscous matter, or by a granular appendage, very rarely affixed to the rostellum, *e.g.*, *Epidendrum*, *Laelia*, *Cattleya*, *Masdevallia*, etc.

2. **VANDÆÆ.** Anther 1, posterior, operculate, incumbent, or applied to the rostellum, cells generally confluent. Pollinia waxy, generally two or four in adjacent (anterior and posterior) pairs,

often stipitate, *e.g.*, *Odontoglossum*, *Oncidium*, *Phalaenopsis*, *Sarcanthus*, etc.

3. **NEOTTIÆÆ.** Anther 1, posterior, operculate or erect and persistent, cells distinct parallel. Pollinia granular, powdery or setlike. Stem not bulbous, *e.g.*, *Anæctochilus*, *Vanilla*, etc.

4. **OPHRYDÆÆ.** Anther 1, posterior, erect, prone or reflexed, cells parallel or divergent, adnate with the clinandrium, often continuous at the base with the rostellum. Pollinia granular, in each cell produced into a basal candle, which remains attached to them on dehiscence, *e.g.*, *Ophrys*, *Orchis*, etc.

5. **CYPRIPEDIÆÆ.** Anthers 2, sessile or stipitate at the sides of the rostellum, the posterior one often sub-petaloid, pollinia granular, *e.g.*, *Cypripedium* and *Selenipedium*.

Orchids are divisible into two classes, the *Epiphytes*, or those growing upon trees, and *Terrestrial*, or ground-orchids, which grow upon the earth. The two classes require some difference as to the mode in which they are grown, a difference pointed out in this work under each genus in its alphabetical order. At present we shall confine ourselves to such general directions as are applicable to the cultivation of both classes of *Orchids requiring Stove treatment*. Many orchids, however, are now known to succeed, and indeed to thrive better in the temperatures of a greenhouse than in those of a stove. Among them are *Bletia verucunda*, *Cypripedium insigne*, *Odontoglossum grande*, *Phaius grandifolius*, *Lycaste Skinneri*, and *Cattleya Forbesii*, while others, such as *Cypripedium spectabile* are quite hardy.

House for Orchids.—As they require great light, the house ought to be so placed as to catch all the rays of light from the sun. A span-roofed one will do so, or to the greatest degree; and so low in the angle, that the plants, whether in pots or baskets, or on logs of wood, will all be near to the glass. We find the best aspect is for the roof to fall due east and west; then the lengthway of the house will, of course, be north and south. By this means the heat and light of the sun are more equalized. In the cold mornings of early spring the sun will sooner give light and heat on the east side, and will be at noon in such a position that his beams will be slanting to the angle of the roof, whilst in the afternoon his power to give light and heat will be considerably prolonged. Every plant in this house will thus have its due share of light and heat. During the hot months of May, June, July, and

August, the shade or blind can be let down on the morning side of the house, drawn up at noon, and let down on the afternoon side just as the sun shines; thus giving the plants all the light possible, and at the same time protecting them from the burning rays of the sun. There need not be any upright glass at the sides or ends of the house. The walls ought to rise high enough to allow a comfortable walk and head-room. The rafters and lights ought to be fixed, and to give air a few openings may be easily contrived in the highest part of the house, and a few sliding panels near the floor in the walls. This cold air ought to flow in over the hot pipes, and to become heated before it comes in contact with the plants. In summer, when there is no heat in the pipes, the external air is naturally so warm that no injury will accrue to the plants by admitting it into the house without being artificially heated. It is almost absolutely necessary to have more than one house. However small the collection may be, there will be some that require more heat than the others. The orchids of South America will flourish far better in a house of moderate temperature than in a house highly heated. This house we would distinguish by the name of "the Mexican house." The orchids, natives of Java, Borneo, Singapore, the Philippine Islands, and the hot jungles of Hindostan, require, on the other hand, a much higher temperature, and close, moist atmosphere. The house for these plants we would designate "the East Indian House." By having two houses a considerable number of advantages will be secured. The stove species, as soon as they have made their growth for the year, where there are two houses, may be removed into the cooler or Mexican house; and that removal or change of temperature will harden their pseudo-bulbs, and concentrate the sap, causing them thereby to become more healthy, robust, and free to flower. Should any of the South American species require a little more heat, they could be conveniently removed into the warmer house to make their growth. The cooler house will also be useful to place any of the Indian species in when in flower, which change will considerably prolong their season of blooming. The two houses may join each other, divided by a partition either of brick or glass. We should prefer glass, as being neater, and showing off the plants, in both houses, to greater advantage.

Heating.—As these plants require,

during the seasons of growth, a larger amount of moisture than most other plants, the plan to effect this is to heat the houses with hot-water pipes, laid in tanks. The water in these tanks should be deep enough to cover the pipes about an inch with water. The tanks need not be more than ten inches wide, inside measure. The diameter of the pipes should be three inches and a half. At some convenient place there ought to be a tap to let off the water out of the tanks. This ought to be done frequently, in order to obtain a sweet moisture. If the water be allowed to remain in the tanks for a length of time it becomes foul, and then, when heated, sends forth a disagreeable smell, which is very unhealthy both to plants and persons. In winter, when the plants are, or ought to be, mostly at rest, they require a drier atmosphere. In order to induce this, the tanks ought to be emptied during the winter months, from the middle of October to the middle of February. Should the plants appear to shrivel too much, the pipes may be occasionally syringed early in the mornings of fine days. The number of pipes and tanks required depends, of course, upon the size of the houses. The large house at Messrs. Henderson's, of Pine-Apple Place, has four tanks in it; the width of the house is eighteen feet. Two of those tanks are open, that is, have no cover, and are placed under a platform formed with large, thick slates, spaces being left between each to allow the moisture to ascend amongst the plants. The other tanks have covers to them, with holes to let out the moisture. These holes have brass lids to them, so that the moisture can be confined as circumstances require. Now, this answers the purpose well during the months of spring; but we have too much moisture during winter, so that the plants grow more than they flower. Supposing, then, a house eighteen feet wide requires four tanks, a house fourteen feet will require three; nine feet, two; and less than that, only one. The return-pipes may run under the tanks to the boiler, or, if the tanks are placed so near the floor that the return-pipes cannot be placed under, they may be arranged to run on one side. The best kind of boiler we know is the saddle boiler.

Shelves.—In any convenient part of the house where a shelf can be put so near the glass as to allow plants in pots to be placed upon it, it is desirable to have them. We have always found small plants in pots, that have made a

good start, do well in such a situation. The plants, however, should not be too near the glass. The extremity of the leaves should be at least nine inches from it. The shelves, also, should not be placed where the water that overflows or runs through the pots will drop upon any plants.

Stages.—The arrangement of these will depend upon the width of the house. If the house is wide enough to allow a walk all round it, and a walk in the centre, there will be two stages. The centre walk should be elevated as high as possible, to allow head-room for the manager and visitors to walk comfortably. This elevated walk is of considerable use, affording a good opportunity to watch the progress and state of the plants, and to observe when they require watering, repotting, and cleaning from insects.

Shelves of the Stage.—Every shelf ought to be a shallow cistern to hold water. Blue slate is the best material to form each shelf on the stage. The upright slate forming the sides of each ought to be elevated at least two inches, and made water-tight. These cistern-shelves may either be filled with small, pebbly gravel, all the sand or other binding material being washed out of it, to prevent its setting hard, or they may be left empty, and shallow pots turned upside down, just high enough to allow the plants to stand clear of the water; for it is intended that these cistern-shelves should be, during summer, kept full of water. These shelves of the stage must be as near the glass as the size of the plant will allow. Several advantages to the health of the orchids accrue from this arrangement. The most important is a constant supply of moisture to the air, at a time when the heat of summer renders the application of heat to the tanks unadvisable. Another advantage is the prevention of the attacks of insects, such as woodlice and slugs. These destructives cannot travel through water; and as the plants stand, as it were, upon a number of little islands, they are protected both day and night from these devouring enemies. Care, however, must be taken that the citadel itself does not harbour them. The cockroach and woodlouse often secrete themselves during the day amongst the rough pieces of turf and broken pots used as drainage. If there is any suspicion that these enemies are in these secret places, they must be diligently sought for, by visiting the houses with a bull's-eye lantern by night, and catch-

ing them at their depredations. Pursue them with all your diligence. Should the tender roots, or flower-shoots, still appear to be eaten occasionally, take the severe measure of turning the plants out of the pots, and search for the vermin amongst the peat and potsherds, and when they are once entirely got rid of, take care to place the plants so that their leaves do not come in contact with anything that will form a bridge for the insects to travel on.

Hanging up Plants on Logs or in Baskets.—Large-headed nails, or hooks, may be driven into the rafters, or strong iron rods, well painted, may be suspended along the roof over the walks, and strong iron hooks, shaped like the letter S, placed at proper distances to hang up the various kinds of plants that require such situations. We recommend the situation for these to be over the walks, to prevent the water, when applied upon the plants, falling on the stages or shelves.

Where these plants are numerous, it is advisable to devote a part of the house to them. Underneath would be a convenient situation for a cistern to contain the rain water that falls upon the roof—the best of all water for watering purposes.

Cistern.—This is quite indispensable in the orchid-house. The great use is the heating the water for syringing and watering purposes. Another use, and an important one too, is for dipping the blocks with the plants on them; also to dip the *Stanhopeas*, *Gongoras*, and other plants in baskets. When those plants begin to grow in the spring they require a good steeping, and the cistern offers a proper place for that purpose. Two or three hours will not be too much to steep them. The peat during the time of rest becomes dry and hard, and requires this wetting to soften it, especially if the plants are to be shifted into new baskets.

As orchids require frequent syringing, sometimes twice or thrice a day, we have made use of pots—garden pots, in fact, without holes. These are placed round the house, near the hot-water pipes, at a small distance, about six or nine feet apart. Our readers that are in the habit of syringing will immediately perceive the great saving of time and labour by having these pots so handy. Instead of having the water to carry in garden watering-pans, these pots, being kept constantly full of warm water, are always ready.

Syringing in Winter.—During the

dark days of winter the operation of syringing requires considerable judgment. A large number of orchids will be at rest, requiring but little water, especially those *in pots*. Others, *on logs*, must be syringed on such mornings as the sun is likely to shine. There are, however, a few plants, even in pots, that are much benefited by the free use of the syringe at all seasons of the year. *Zygopetalum violaceum* and *Z. meled-gris* are two plants much improved by this mode of treatment; and the reason they are so improved is evident enough, when we consider the situation in which they grow naturally. Dr. Schomburgh found them growing on moist rocks, near to a cataract, on a river (Essequibo, we believe) in British Guiana.

All the Indian orchids that have no pseudo-bulbs require more syringing in winter than those that have such reservoirs of vegetable life to sustain them. The generic or family names of such as we mean are—*Aerides*, *Angraecum*, *Phalænopsis*, *Renanthus*, *Saccobolium*, *Sarcanthus*, and *Vanda*. All these have a simple stem, clothed with leaves. If exposed to a high, dry heat the leaves and stems will shrivel much more than is beneficial to their health; therefore, whenever a shrivelling is perceived, let them have a gentle syringing, thoroughly wetting the whole plant. This will revive them, and keep them fresh and healthy.

Syringing in Spring and Summer.—It is during these two growing seasons that the syringe is most beneficial, and then they should be deluged almost with showers from the syringe, taking the precaution to allow them to become dry once a day. They are sure to become dry enough during the night. Let the water from the syringe be the same temperature as that of the atmosphere of the house, and let it fall gently upon the plants, thus imitating natural showers of rain as much as possible. We have found the plants much refreshed in summer by a gentle syringing, when it was actually raining out of doors. In truth, if such a thing could be managed, we should be glad to expose them, during the gentle, warm showers of April, to the rain that falls from the clouds. We are quite sure it would do them good. It is, however, the plants on logs that benefit most by the use of the syringe, both in winter and summer. Of course, they require the most when they are making fresh roots and growths; but even when at rest they must be syringed occasionally,

to prevent the roots and pseudo-bulbs from shrinking too much. In that state, the finest-rosed syringe must be used, to prevent so much water falling upon the plants (if any) below.

During the seasons when the syringe is used most freely, should any of the plants have perfected their growth, and consequently require less water, place such in a corner of the house by themselves, and syringe them less frequently. Towards the end of summer the whole of the plants ought to be perfecting their growths, excepting the Indian ones above-mentioned and *Zygopetalum*. These grow, more or less, all the year, but others must have an entire rest; therefore, cease syringing so much as soon as you think there is a fulness and ripeness about the pseudo-bulbs, showing that they have made the growth for the year. If you continue syringing as much as ever, there is danger of starting them again into growing prematurely, and then you will have weak, puny shoots, and injure both the flowering and growth for the ensuing season. It is impossible to give any particular time when to cease syringing, or watering at the root with a garden-pot; experience and observation must guide the cultivator. In general, we may say the quantity of water, whether applied with the garden-pot or syringe, ought to be considerably lessened towards the end of summer—that is, about the end of August. The pseudo-bulbs ought to be then fully formed; and, whenever that is the case, they require much less water. By the middle of October the water ought to be entirely withheld, excepting just enough to prevent the plants from shrivelling.

Shading.—We use a kind of canvas called “tiffany.” It is thin, yet just close enough in the mesh to prevent the rays of the sun striking through the glass, and injuring the flowers and leaves. We shall try to describe how it is applied. First, a pole about two inches in diameter, of the length of the house, or rather longer, is made of deal, and quite round. At one end a kind of wheel is fixed, of larger diameter than the pole (about one-third). On each side of this wheel a round board is nailed, projecting beyond it about three inches. These boards are about three quarters of an inch thick, and are bevelled off from the inside. When this is done, it forms a groove. This is intended to receive the cord, it being nailed to the wheel. The canvas is then nailed to the long pole, it having

first been sewn together of the size of the house. The pole, with the canvas attached to it, is then laid upon the house, a flat piece of wood $2\frac{1}{2}$ inches wide, and a quarter of an inch thick, is nailed to the highest point of the house, and the canvas is tightly stretched and nailed to the flat piece of wood, using some narrow woollen lists, stretched along it previously to driving in the tacks. This prevents, in a great measure, the canvas from tearing off with the winds. Then, taking hold of the cord now wrapped round the wheel, and pulling at it, the wheel turns round, and, of course, the pole also; the canvas wraps round it, and, at last, is rolled up at the top; the cord is then fastened to a long kind of button, and there remains till shade is required. The cord is then unfolded, and the pole let gradually down to the bottom, where some pieces of wood stop it from going off the house, or tearing away the canvas from the top. It may be made to last longer, by having weather-boards fixed on the top of the house to receive the canvas when rolled up under it, thus sheltering it from the rain, which is the great cause of its decay. Care must be taken, when it is rolled up, that it is perfectly dry. During the dark, short days of winter, when the sun has not power to injure the plants, the blind may be stored away in some dry shed or room till the days lengthen, and the sunshine becomes dangerous to the well-being of the plants.

The proper amount of Heat, Moisture, and Air the Plants require at all times of the year.—The power of heating should be more than is required in ordinary winters, in order to be prepared for those very severe ones that sometimes occur. It is always easy enough to give less heat in moderate weather by having less fire applied under the boiler. The degrees of heat required we shall now give for all the year.

INDIAN HOUSE.	FAHRENHEIT.			
	Day with Sun.	Day without Sun.	Night.	Morn
Spring	75	70	60	55
Summer	85 or 90	70	65	60
Autumn	70	65	60	55
Winter	65	60	55	50
MEXICAN HOUSE.				
Spring	70	65	60	55
Summer	75	65	60	55
Autumn	60	55	50	50
Winter	55	50	50	45

Our readers will perceive that the lowest temperature at all seasons is in the morning; that is, before the fires are stirred. The heat in the mornings in summer will depend upon the heat of the atmosphere out of doors; the rest of the day may be regulated by giving air. The principle of having a lower temperature during the night is perfectly natural. The variations even in tropical countries, in that respect, are great.

Watering with the Garden-pot.—As a general rule, let it be laid down never to water an orchid except it requires it; therefore, in commencing to water, observe each plant well, but quickly, and water accordingly. An orchid requires watering when it is growing and dry. The quantity to be given depends, again, upon the stage of its growth. If the young shoots and new roots are just beginning only to make their appearance, they require a very moderate quantity; but, as then the plant ought to be repotted, and the new, fresh compost is, or should be, moist of itself, the water must be withheld until the surface, at least, feels quite dry to the touch. Again, the water should be applied at a small distance from the young shoots, which ought never to be saturated, or even wetted, especially either in the dark, cloudy days of winter or of early spring. In summer, when the heat is increased, the sun shining, and air given, the operator need not be so nice, as the extra water will soon evaporate, and dry up even from the young and tender shoots. When the young shoots begin to form pseudo-bulbs, the quantity of water may be increased, care being taken that it does not lodge in the leafy sheaths which surround the green or young bulbs, especially of *Cattleyas*. We have often seen a year's growth destroyed by allowing the water to lodge in those tender parts. The way to remedy this is with a sharp knife, or a small pair of scissors, to slit open to the bottom the sheaths that hold the water; but this is an operation that must be done very carefully, without injuring the young pseudo-bulb, or the cure will be as bad as the disease; for, if you wound a pseudo-bulb, ten to one it will perish. As soon as these sheaths turn yellow, and not before, they may be entirely removed safely. When in that state they will easily part from the bulb without injuring it, if carefully pulled off. When the growths are young, whether the water is applied with the rose or spout alone, it will generally be quite sufficient to wet the earth or com-

post only round near the edge of each pot. If the water is poured indiscriminately all over the surface of the compost, especially in the early season of the year, the consequence will be to endanger the young shoots. At that season, and in that state, if the water is slushed upon the plants, it will cause several, if not all, of the tender young growths to perish; but as those growths begin to approach their usual size, and the warm, long, sunshiny days prevail, that is the critical or very time orchids require an abundance of water.

Giving Air.—The method we recommend to give air by is with wooden shutters, let into the wall at intervals of four feet between each, on each side of the house. The wooden shutters, or doors, should be 2½ feet long by 15 inches broad. A frame of wood ought to be fitted into the opening in the wall, to hang the shutters on. These should swing on the centre with two iron pins, so that when they open they will be horizontal, and let the air into the house plentifully. When less air is required, every other aperture need only be opened, or the shutters may be propped only half open. When they are opened, the fresh air will rush in, and, meeting with the pipes in its progress, will be partially heated and softened before it comes in contact with the plants—a point worth attending to. For nine months in the year this way of giving air to the Indian house will be found all that is wanted. During the three hot months of summer, it will be necessary to give some air at the highest part of the roof. The ridge of the house should be made flat, about nine inches broad, and parts of it made movable, to lift up with an iron rod whenever the heat of the internal air exceeds the proper degree. This is the guide on all occasions and all seasons. When the heat is too much, give air.

It will be found that the Mexican house requires more frequently to have air given to it than the other, because the plants in it do not require so much heat. To know, at all times, when to give air, have a copy of the table of heat for the orchid-house copied, and hung up in a convenient place to refer to.

Resting.—To know when the bulbs are in a proper state to go to rest may be, to our readers, of some consequence. They ought to be strong, and, if expected to flower, at least three feet high, stout, and firm, quite to the apex. All the leaves ought to turn yellow, and drop off in the same manner as any other

annually leaf-shedding plant; and all this ought to take place early in autumn. As soon as it does so, remove the plant, or plants, into a *drier* and *cooler* house, and keep them there until the buds at the bottom of each pseudo-bulb begin to appear.

Cleansing the Leaves.—Take down the plant from its high position; if the moss or peat, whichever it may happen to be growing in, is dry, give it a good soaking in the cistern, the water of which is at a temperature of 70°. Whilst it is soaking, all dead leaves are to be carefully removed, and every part of the plant thoroughly washed with a sponge. If the leaves are thick and leathery, the sponge is to be rubbed over them several times with a heavy hand. In fact, it might be called a good scrubbing; being careful, of course, not to injure it. For more tender leaves, we have, very lately, used something else. We observed that the sponge, though used ever so lightly on these tender, thin leaves, injured them slightly. Happening to observe a piece of thick leather, such as soldiers' belts are made of, it was taken and wrapped round the end of a small stick, fastening it firmly to it with some small copper wire, leaving half an inch of it projecting beyond the stick; it had then the appearance of a brush made of leather. With this instrument the leaves were washed, and it was so soft and pliable that it did not injure the youngest or tenderest leaf, yet effectually washed the dust and dirt off from the leaves. This washing not only clears off the parasites and any other obstruction, but also destroys insects, particularly the red spider and black thrip, two of the most pernicious enemies to orchids. Let every part of the plants be well cleansed—leaves, stems, and pseudo-bulbs. Not only will the plants look better, but they will be greatly benefited in their health.

Potting.—Generally speaking, the months of January, February, and March are the proper times; but as there is no rule without exceptions, some orchids require potting at all seasons of the year. The beginner may know when to pot his plants by this observation:—Whenever they are determined to grow, they must be potted. The only precaution necessary to observe, in the dark seasons, will be to use the stuff you pot them in (for it can hardly be called soil) in a moderately dry state, and give no water excepting a sprinkling to settle the compost.

In the first place, have ready a quan-

tity of broken pots or potsherds of several sizes; next, procure some good turfy peat, knock it into pieces with a heavy hammer, crushing the finer soil entirely out of it; then pass it through a fine sieve, and what remains in the sieve is the best stuff for orchids: it is light, open, and porous. Next, have some charcoal at hand, broken into pieces no larger than a hen's egg, nor smaller than a hazel nut. Another article, and you will have all you need for pots and baskets; this is white bog-moss, or sphagnum, which should be partially chopped with a sharp hatchet, and the dust also sifted out of it. We have a great abhorrence for anything close or fine about orchids, excepting terrestrial ones.

Having all in readiness, take your plant, turn it out of the pot carefully, be mindful of the roots, and bruise or injure them as little as possible. Perhaps some roots will be found adhering very firmly to the sides of the pot, to part them from which we have used a long, thin-bladed knife, thrusting it carefully down between the root and the pot. In very bad cases we have found it necessary to break the pot; but this must be done very gently, or the very act of breaking may destroy the roots. The plant being cleared from the pot, shake away all the old compost; then examine the roots closely, and cut off all the dead ones. This is a convenient opportunity, also, to look after insects, especially the white scale, the most pernicious of all vermin to orchids, excepting, perhaps, the black thrip. With a brush clean them all off, and wash the whole plant with strong soap-water. Your plant is now ready for potting. Choose a pot of the proper size: generally speaking, orchids, to grow them well, take larger pots in proportion to their size than any other class of plants. Let your pots be perfectly clean both inside and out. Lay a large piece of potsherd over the hole at the bottom of the pot; then place some rather smaller pieces of the same, and over these the smallest ones. Altogether the pot ought to be three parts filled with this drainage. This point is of the utmost importance, for if the plants are not superlatively well-drained they will not thrive long or satisfactorily. Over this drainage place a thin layer of charcoal, and then a layer of the turfy peat, mixing with it some broken pots and charcoal. Introduce the plant now, and spread the roots, if many, all over the surface of the compost, working it amongst them, gradually filling it in till

the pot is full, and keeping the body of the plant well up; raise the compost up about two or three inches above the level of the edge of the pot in proportion to its width. A small pot need not have the plant above one inch raised, a middling plant two inches, and for the largest-sized plant three inches will be sufficient. The whole of the plant, pseudo-bulbs and all, excepting the roots, ought to stand clear up above the compost. It will be loose and ready to tumble over if of such kinds as *Cattleyas* or *Dendrobiums*; to prevent which, thrust into the compost some stout sticks, and tie each pseudo-bulb to each stick firmly. These will secure the plant, and give it a neat, tidy appearance.

Orchids in Baskets.—A considerable number of species require baskets, because the flower-stems are pendent, and, consequently, naturally require a position to allow the flowers to grow down. In fact, some send the flower-stems perpendicularly down through the soil or compost. Now, if these are grown in pots, the flower-stems run down into the soil, and there perish. It is true they have been grown in pots on a hillock built up six inches or a foot above the rim of the pot, and then part of the flower-stems manage to find their way to the outside of the little mound; but a considerable number descend straight downwards, and soon rot for want of air and light. By growing them in baskets this evil is prevented, and every raceme (bunch) of flowers arrives at perfection.

The baskets should be of a size suitable for small plants—small ones requiring only small baskets, middling ones the middle-sized, and large ones in proportion. The way to basket the plants is this:—Have the peat or compost prepared exactly as for potting above-mentioned; cover the bottom of the basket with a thin layer of moss—green would do, though we prefer white, or sphagnum. This moss is to prevent the peat from dropping through the openings between the rods forming the bottom. Then place a portion of peat upon the moss. In the next place, prepare the plant by taking it out of the old basket or pot, or perhaps off from a log. Do this as carefully as possible, without injuring the living roots. If the old peat, in which it has been growing, perhaps, for years, is very hard, and the living roots are so firmly attached to it that they cannot be detached without breaking them, take the plant and put it into the cistern, and let it remain there till

the peat is thoroughly soaked. Take it out, and set it in some convenient place to drain off the water. If this is done a full week before you intend to re-basket the plant, it will be all the easier to do; the object being to soften the peat so as to be able to pick away, with a small-pointed stick, as much of the old peat as possible. Examine, also, the pseudo-bulbs and leaves, and clean them thoroughly from dirt and insects. Prune away all dead roots, and then the plant will be ready to be put in its new habitation. Place it in the middle of the basket, and fill in all round it with the new compost. Set the basket then on the floor, and, with the syringe held pretty close to the peat, give it a good watering, forcing the water out of the syringe pretty strongly: this will be found to make the compost firm, so that future waterings will not wash it off the basket on to the floor, or plants underneath. One thing we would especially guard our readers against, and that is, having the basket made deep. Some may have an idea that if the plants have a large lot of stuff to grow in they will thrive better, and produce more flowers; but this is a mistaken notion. The roots of the orchids of this class run on the surface, or, at least, very closely beneath it; in truth, if the air is properly surcharged with moisture, the roots will prefer running out of the compost. Frequently the long roots of *Stanhopeas*, that push strongly, and run along the surface of the compost, send forth fibres, not into the compost, but, strange to say, upwards into the congenial air, gathering, as it were, aerial food to support and feed the plant they belong to. This proves satisfactorily enough that deep baskets are no advantage even to the growth of the plant, but to the flower-stems of some kinds of *Stanhopeas* they are certainly injurious. We say *some kinds*, such as *Stanhopea insignis* and its varieties, *S. tigrina* and its varieties, and all that have, like these, short and few-flowered racemes. Such kinds as *S. oculata*, *Wardii*, and *quadrifloris*, which have long flower-stems, may find their way through a deep basket, but would do so easier and safer through a shallow one.

Pots.—The kind we use and prefer may be described as a shallow, wide pot, the proportions of which are as two, three, and five; that is, two inches wide at the bottom, three inches deep, and five inches wide at the top, all inside measure. Larger pots to be in the same proportions. Small ones need only have

one hole at the bottom; but it should be larger than those generally made. For the two-inch-wide pots at the bottom, the hole ought to be three-quarters of an inch in diameter, the great object being to allow the escape of water quickly. Larger pots must have three holes, each of the same diameter. Hard-burnt ones must be avoided for these plants, as well as for any other. The reason why we prefer these wide, shallow pots is, that the roots of orchids are, generally speaking, either on the surface or very near it; besides, a large proportionate surface is exposed to the benefit of air and moisture, both of which are beneficial to the roots of an epiphyte. Terrestrial orchids, whose roots descend deeper, will be better in the ordinary-shaped pot.

Baskets.—Various materials and forms have been used in this necessary article. The first probably was made of common iron wire, painted green, and the form round, deep, and with a flat bottom. This material is almost entirely disused, for, although the paint for a time prevented them from rusting, the great moisture and heat soon decomposed the paint, and then the wire became oxidized, or rusty, and is then very injurious to the roots, as well as being unsightly. Those made with copper wire are much better, lasting longer, and are not so injurious to the plants. The only objection we know of is the expense. Where that is no consideration, we should have no great objection to their adoption. Baskets have also been made of earthenware; but, if there was no other objection, their great weight would be sufficient to set them aside as bad. We have tried all these, and have come to the conclusion that baskets made of wooden rods are the best for this purpose. We mentioned before, that the most ornamental are made of the corrugated or rough-barked maple rods; but, as these are not always to be met with, hazel rods may be used, and make excellent baskets. The way we make them is simple enough. First, the rods are sawn into proper lengths. The smallest we use are about the thickness of a man's middle finger. With this size, the smallest baskets are made. These are seven inches wide, and three rods deep. In this size, small *Stanhopeas*, and small plants of *Aerides*, *Saccobium*, *Vandas*, *Gongoras*, etc., are grown. For larger plants, larger baskets are made, and thicker rods used. The largest we ever had occasion to make was for a fine plant of *Aerides odorata*.

This plant is four feet high, and two and a half feet through. The rods used for it are nearly as thick as a moderate-sized man's wrist. The basket is two feet square, which is the shape we prefer, as being the most simple and easiest made. When the rods are sawn into lengths, the ends are pared smooth with a knife; then small holes are bored through each, one at each end, as near it as possible without splitting. The instrument used to bore the holes with is a very small steel rod, about six inches long, with a wooden handle; it is filed to a point at the end intended to bore the hole with. We find it convenient to have two or three, for a reason we shall state presently. After a certain number of rods are cut and smoothened, they are taken to a place where there is a small, clear, red fire; the sharp end of one of the borers is put into it about one inch. As soon as that is red hot, the other is put in, the heated one drawn and thrust into the rod very near the end, and held there as long as it continues to burn its way without much pressure. If too much force is used, the wood will be apt to split. As soon, therefore, as the instrument ceases to burn its way through, it is replaced in the fire. The other by this time will be red also; this is then taken out of the fire, and applied to the hole. This operation is thus performed with each bore alternately till the hole is made through the rod. The description of this operation takes up considerably more time than the operation itself. It is quickly and easily done, as any of our readers may prove on trial. After as many rods are bored as may be wanted at one time, the next thing is to put them together. The articles necessary for this are some copper wire and a few flat-headed copper nails. Each basket will require four lengths of wire, the length of each to be in proportion to the size of the basket they are intended for. They should be long enough to meet at least eight inches above the top of the smaller-sized baskets, and from a foot to eighteen inches above the larger ones. At the end of each piece of wire make a loop so large that it will not draw through the holes; then lay the first two rods, and upon them, for the smallest basket, lay three others; nail these three to the two outside rods, thus forming a sort of raft, to use a nautical term for want of a better; turn this over, and underneath it put two other rods, to form the other two sides of the basket; then draw the four pieces of wire through the holes at each

corner, the looped end being underneath. Continue to lay a pair of rods alternately, drawing the wire through each till the basket is of the required depth. The smallest size, three rods deep; the two next, four deep, and so on. When that is done, make four small pointed pegs, and drive them into each hole at the four corners. This will fasten the rods in their places, and prevent them from ever starting upwards; then draw the wires together at the top, twisting each pair over each other, and fasten them with a piece of fine wire. Your basket is now complete and ready for use.

Logs.—None are so good as the wood of the *Acacia*, commonly so called, but which really is the *Robi'nia pseudo-acacia*. Its wood is firm, and does not soon decay. The next best is the oak. In all cases we strongly recommend the removal of the bark; our objection to retaining it being, that it only serves as a hiding-place for wood-lice, small snails, and other destructive insects, besides retaining in winter too great a quantity of moisture. The wood should be procured a year before it is used, and then the bark will come off very easily. We except cork wood, which we think very good when it can be procured readily for this purpose; and the bark of cork suits the orchids well, and, unlike the others, does not rot so soon, and consequently, has not the objection to its use of being a receptacle for vermin. The best wood for baskets is the rough-barked, common maple. The branches of this tree make the handsomest baskets; but as it is not so plentiful as the hazel, the latter is the sort we recommend. Some object to baskets of this description on account of their soon perishing. This we consider no objection at all, but rather an advantage; for as soon as the basket is decayed the plant has grown so large that it requires a new one, and the rotten sticks of which the old basket is made are more easily broken and removed than sounder ones.

Orchidium. A synonym of *Calypso*.

O'rchis. (From *orchis*, testiculate; referring to the two oblong, bulb-like roots of many of the species. *Nat. ord., Orchideæ*; *Tribe, Ophrydeæ-Serapieæ.*)

Chiefly an European genus of ground orchids. Seeds, as in *Ophrys*, when obtainable; division of the tuberous roots, though they do not relish transplanting well; it should be done when the plants are in a dormant state. The British species are chiefly found on chalky hills, and in pastures where calcareous matter abounds. The exotic kinds like an addition of fibry peat. The

tender ones, in fact all, when cultivated, should be treated as alpinæ; those found in rich pastures require a moister situation.

Orgy'ia anti'qua. The Vapourer Moth. The caterpillar of this moth is extremely destructive, by feeding on the foliage of almost any tree, but especially of the Hawthorn, Pear and other Rosaceæ trees. It is of a dark grey colour, with reddish tubercles and numerous tufts of yellowish hairs. The male moths are brownish, with the fore wings clouded and having a white crescent-shaped mark near the hinder angle. The females, which are grey, have only rudimentary wings. The yellowish cocoons should be collected and burnt, the trees syringed with soft-soap during the caterpillar stage.

Origanum. Marjoram. (From *oros*, mountain, and *ganos*, joy; referring to the natural places of growth. Nat. ord., *Labiatae*; Tribe, *Satureiæ*.)

The following are all hardy herbaceous perennials. Seeds, division of the roots, and cuttings; sandy soil. See MARJORAM.

- O. ægyptiacum*. 1. Pink. July. Egypt. 1731.

Orithalia. A synonym of **Agalmyla**.

Orithyia. A synonym of **Tulipa**.

Orixa. (Derivation uncertain. Nat. ord., *Celastrineæ*.)

O. japonica. Green. Japan. Gf. t. 1232.

Ormoscopon. (From *ormos*, a chain, and *karpos*, a fruit; referring to the pods. Nat. ord., *Leguminosæ*. Syn., *Diphaca*.)

Stove or greenhouse shrubs. Old plants may be turned out into the borders in summer. Cuttings of half-ripened shoots, in April, in peat and loam.

O. coronilloides. Pale yellow. May. Tropical Africa.

— *sennoioides*. 3. White. China. Wight Ic. t. 297. Syn., *Diphaca cochinchinensis*.

Ormosia. Bead-tree. (From *ormos*, a necklace; referring to the seeds of *O. coccinea*, which are scarlet, with a dark spot, which are strung for necklaces. Nat. ord., *Leguminosæ*; Tribe, *Sophoreæ*. *Macrotropis* is regarded as a synonym of this by Bentham and Hooker. Allied to *Sophora*.)

Stove evergreen trees, blue-flowered. Cuttings of half-ripened shoots in sand, under a bell-glass, and in bottom-heat, in May; sandy, fibry peat, and a little loam. Winter temp., 48° to 55°; summer, 60° to 85°.

O. coccinea. 10. July. Guiana. 1823.

— *dasycarpa*. 10. June. W. Ind. 1793.

Ornitharium. (From *ornitharion*, a small bird; alluding to the flowers.

Nat. ord., *Orchideæ*; Tribe, *Vandæo-Sarcantheæ*.) A synonym of **Sarcochilus**.

O. striatum. Paxt. Fl. Gard. i. p. 188, fig. 117. See *Sarcochilus teres*.

Ornithidium. (From *ornis*, *ornithos*, a bird, and *eidos*, like; the column is beak-like. Nat. ord., *Orchideæ*; Tribe, *Vandæo-Maxillariæ*.)

Stove epiphytal orchids, with rather small flowers.

O. album. See *Camaridium album*.

— *coccineum*. 1. Crimson. June. W. Indies. 1790. Syn., *Cymbidium coccineum*. B. M. t. 1437.

— *densum*. White, purplish. Mexico. 1836. Ref. Bot. t. 105. Syn., *Maxillaria densa*. B. R. t. 1804.

— *ochraceum*. Ochre, purple, white, mauve. New Grenada. 1887.

— *strumatum*. White. Costa Rica. 1875.

Ornithocephalus. (From *ornis*, a bird, and *kephale*, a head; in reference to the form of the column and anther. Nat. ord., *Orchideæ*; Tribe, *Vandæo-Oncidiæ*.)

Small stove epiphytal orchids. For cultivation, see EPIDENDRUM.

O. grandiflorus. White, yellow. 1832.

— *Oberonia*. Yellow, white. Trinidad. 1869.

Ornithochilus. (From *ornis*, a bird, and *cheilos*, a lip; in allusion to the shape of the lip or labellum. Nat. ord., *Orchideæ*; Tribe, *Vandæo-Sarcantheæ*.)

Stove epiphytal orchid. Culture the same as for *ÆRIDES*.

O. fuscus. Brownish-yellow, purple, reddish. Burmah. 1865. Syn., *Ærides difforme*.

Ornithogalum. Star of Bethlehem. (From *ornis*, a bird, and *gala*, milk. Nat. ord., *Liliaceæ*; Tribe, *Scilleæ*. Allied to *Scilla*.)

Pretty bulbous plants, white-flowered, where not otherwise specified. Offsets; sandy loam and a little leaf-mould for the hardy kinds; a little peat added for those that require a cold pit in winter. If the latter are planted out in a dry border, the border must be protected from wet and frost during winter, or the bulbs taken up, and kept in drawers or bags where no frost will reach them.

HARDY BULBS.

— *vicioides.* 1. Yellow. June. Hungary. 1819.

Oro'ntium. (The ancient Greek name for a plant supposed to grow on the banks of the river *Orontes*. Nat. ord., *Aroideæ*.)

Hardy aquatic perennial. Propagated by divisions.

- O. aquaticum.* Pale green. May. North America. B. C. t. 402.
— *japonicum.* B. M. t. 898. See *Rohdea japonica*.

Orotha'mnus. (From *oros*, mountain, and *thamnos*, shrub. Nat. ord., *Proteaceæ*.) A synonym of **Mimetes**.
O. Zeyheri. B. M. t. 4357. See *Mimetes Zeyheri*.

Oro'xylum. (From *oros*, a mountain, and *xylon*, wood. Nat. ord., *Bignoniaceæ*.)

Stove tree, requiring abundance of space for its roots to spread. Turfy loam, leaf-mould, and sand. Imported seeds, or cuttings.

- O. indicum.* 40. White, purple. India and Malayan Archipelago. 1775. Syn., *Calosanthus indica*.

Orphanide'sia. (Derivation not stated. Nat. ord., *Ericaceæ*.)

A dwarf, hardy shrub.

- O. gaultherioides.* Caucasus. Gfl. 1891, p. 469, fig. 87.

O'rphium. (After *Orpheus* of Greek mythology. Nat. ord., *Gentianeæ*.)

Greenhouse shrub. For culture, see **CHIRONIA**.

- O. frutescens.* 1-2. Red. South Africa. 1756. Syn., *Chironia angustifolia*, B. M. t. 818; *C. decussata*, B. M. t. 707, and *C. frutescens*, B. M. t. 37.

Orthocarpus. (From *orthos*, straight, and *karpos*, fruit. Nat. ord., *Scrophulariaceæ*; Tribe, *Euphrasieæ*.)

- O. purpureus.* Purple. California. Gfl. t. 1166.

Ortho'ceras. (From *orthos*, straight, and *keras*, a horn. Nat. ord., *Orchideæ*; Tribe, *Ophrydæ-Diseæ*.)

Greenhouse terrestrial orchid.

- O. Solandri.* 1-2. Greenish-yellow. Australia and New Zealand.

Ortho'chilus. A synonym of **Eulophia**.

Ortho'pogon. (From *orthos*, straight, and *pogon*, a beard. Nat. ord., *Gramineæ*.) See **Oplismenus**.

- O. hirtellus.* See *Oplismenus hirtellus*.
— *lobatus.* See *Oplismenus lobatus*.

Orgie'sia. See **Æchmea**.

Orthosiphon. (From *orthos*, straight, and *siphon*, a tube; referring to the tube of the flower. Nat. ord., *Labiatae*; Tribe, *Ocimoideae*. Allied to *Ocimum*.)

Division of herbaceous, or cuttings of the young shoots, when growth is commencing; cuttings of half-ripened shoots of the evergreens; sandy loam and fibry peat; common stove and greenhouse treatment.

- O. a'sperus*. White. May. E. Ind. 1827. Stove herbaceous.
 — *incu'rus*. 1. Pale scarlet. May. E. Ind. 1839. Stove evergreen. B. M. t. 3847.
 — *rubicu'ndus*. Purple. June. Nepal. 1826. Greenhouse evergreen. Ic. Pl. t. 459.
 — *stami'neus*. 2. Lilac. July. E. Indies. 1869.
 — *virga'tus*. Blue. June. Nepal. 1826. Greenhouse evergreen.

Orthostemma. (From *orthos*, straight, and *stemma*, a crown. Nat. ord., *Rubiaceae*.) A synonym of *Pentas*.

Orthotæ'nia turiona'na. See *Pine-bud moth*.

Orthrosanthus. (From *orthros*, morning, and *anthos*, a flower; flowers expand early in the day. Nat. ord., *Iridae*; Tribe, *Sisyrinchieae*. Allied to *Sisyrinchium*.)

Greenhouse herbaceous perennials. Seeds, and division of the plant in spring; sandy loam and leaf-mould; a cold pit in winter, to exclude the frost.

- O. chimborace'nsis*. 1. Peru. 1876.
 — *multiflo'rus*. 1. Blue. June. N. Holland. 1820. Syn., *Sisyrinchium cyaneum*. B. R. t. 1090.

Orvala. (From *Orvale*, the French for *Salvia Horninum*. Nat. ord., *Labiatae*.)

Hardy, herbaceous perennial. Propagated by seeds, or division of the roots.

- O. lamioi'des*. 1½. Pale reddish-purple, white. April. South Europe. 1596. Syn., *Lamium Orvala*. B. M. t. 172.

Ory'za. Rice. (From *Erus*, its Arabic name. Nat. ord., *Gramineae*.)

Stove grass from swampy parts of the East Indies. It flourishes best in a pot plunged into a warm tank.

- O. sati'va*. Widely cultivated in the Tropics as a food plant, but of no horticultural value in this country.

Osage Apple. *Mach'ra*.

Osbeckia. (Named after *P. Osbeck*, a Swedish naturalist. Nat. ord., *Melastomaceae*; Tribe, *Osbeckieae*. Allied to *Melastoma*.)

Cuttings of side, firm, stubby shoots in sand, under a bell-glass, and in bottom-heat; sandy loam, fibry peat, a little dried cow-dung, and charcoal. Winter temp., 45° to 58°; summer, 60° to 85°.

STOVE DECIDUOUS SHRUBS.

- O. cané'scens*. 1838. B. M. t. 3790.
 — *glomerata*. 1. Pink. July. Trinidad. 1818. B. M. t. 2838.

 — *rubicu'nda*. Purple. Ceylon. 1865.
 — *stellata*. 1. Pink. July. Nepal. 1820. B. R. t. 674.
 — *ternifolia*. 3. Lilac. May. Nepal. 1825.
 — *Wightia'na*. Purple. E. Indies. 1863. Wight Ic. t. 998.
 — *zeyla'nica*. 2. Yellow. August. Ceylon. 1799. B. R. t. 565.

Osier. *Salix vimina'lis*, or any of the other species of willows, which are grown for basket-making.

Osmanthus. (From *osme*, perfume, and *anthos*, a flower; flowers being fragrant. Nat. ord., *Oleaceae*; Tribe, *Oleaceae*.)

Hardy evergreen shrubs. For cultivation, see CAMELLIA.

- O. america'nis*. 6. White. June. North America. 1758.
 — *aquifolius*. White. Japan. There are two varieties with white variegated leaves, one being a dwarf.
 — — *ilicifolius*. A dense, compact bush.
 — — *myrtifolius*. Leaves without spines.
 — *fra'grans*. 6-10. Yellowish or white. Summer. Japan and China. 1771. Syn., *Olea fragrans*. B. M. t. 1552.

Osmi'tes. (From *osme*, perfume; smells like camphor. Nat. ord., *Compositae*; Tribe, *Inuloideae*. Allied to *Relhania*.)

Greenhouse, white-flowered evergreens, from the Cape of Good Hope. Cuttings of half-ripened shoots in sand, under a bell-glass, in April or May, and without bottom-heat. Winter temp., 40° to 45°.

- O. bellidia'strum*. 1. June. 1816.
 — *camphori'na*. 1½. May. 1794.
 — *denta'ta*. 1½. May. 1820.

Osmo'dium. A synonym of *Onosmodium*.

Osmu'nda. (The name of a Celtic deity. Nat. ord., *Filices*.)

Hardy, or greenhouse, brown-spored ferns. See FERNS.

- O. cinnamo'mea*. 2. June. N. Amer. 1772.
 — *Claytonia'na*. 2. August. N. Amer. 1772. Syn., *O. interrupta*.
 — *gra'cilis*. 1. June. N. Amer. 1827.
 — *hu'milis*. June. N. Amer. 1823.
 — *interru'pta*. See *O. Claytoniana*.
 — *japo'nica*. 1. Japan.
 — — *corymbi'fera*. Garden variety. 1883.
 — *java'nica*. 1-3. Eastern Coast of Asia. Syn., *O. Presliana* and *O. Vachellii*.
 — *patu'stris*. 2½. 1831.

- O. Prestia*'na. See *O. javanica*.
— *regalis*. 2. July. Britain.
— *spectabilis*. 2. July. N. Amer. 1811.
— *Vachelii*. See *O. javanica*.

EXCLUDED SPECIES.

- O. caroliniana*'na. See *Woodwardia angustifolia*.
— *crispata*. See *Cryptogramme crispata*.
— *humilis*. See *Anemia humilis*.
— *lunaria*. See *Botrychium lunaria*.
— *Phyllitidis*. See *Anemia Phyllitidis*.
— *proserpa*. See *Lomaria proserpa*.
— *Struthiopteris*. See *Onoclea germanica*.

Ossæ'a. (Named after *Ossa*, curator of the Havannah Botanic Garden. Nat. ord., *Melastomaceæ*; Tribe, *Miconieæ*. Allied to *Miconia*.)

Stove evergreen shrubs. Cuttings of young, side, stubby shoots, or the points of main ones, when a little firm, in sandy soil, under a bell-glass, and in heat; sandy peat and loam; common plant-stove treatment.

- O. fascicularis*. 6-10. White. Jamaica.
— *purpurascens*. 3. Purple. March. Jamaica. 1822.

Osteocarpus. (From *osteon*, bone, and *karpos*, fruit. Nat. ord., *Solanaceæ*.)

Greenhouse sub-shrub. Seeds; cuttings.

- O. rostratus*. Blue. Chili. Gf. t. 1175, figs. a-e. Syns., *Alona rostrata* and *Nolana rostrata*.

Osteomeles. (From *osteon*, bone, and *melon*, apple; the fruit. Nat. ord., *Rosaceæ*; Tribe, *Pomeæ*. Allied to *Amelanchier*.)

Hardy evergreen tree. For culture, see MEDLAR.

- O. ferruginea*. July. 1847.

Osteospermum. (From *osteon*, a bone, and *sperma*, a seed. Nat. ord., *Compositæ*; Tribe, *Calenduleæ*. Allied to *Calendula*.)

Greenhouse, yellow-flowered evergreens, from South Africa. Cuttings of small, half-ripened shoots in sand, under a bell-glass, in April or May; sandy loam and a little fibry peat. Winter temp., 40° to 45°.

- O. caeruleum*. 3. Blue. July. 1774. Jacq. Ic. t. 179.
— *calendulaeformis*. 2. July.
— *corymbosum*. 3. August. 1822.
— *ibicifolium*. 4. July. 1816.
— *incanum*. 3. August. 1815.
— *moniliferum*. 3. July. 1714.

Ostrich Fern. *Onoclea germanica*.

Ostrowskia. (After *Ostrowski*, a Russian botanist. Nat. ord., *Campanulaceæ*.)

Perennial herb, requiring the same culture as CAMPANULA.

- O. magnifica*. 4. Blue. Central Asia. 1837.

Ostrya. Hop Hornbeam. (From *ostryos*, a scale; scaly catkins. Nat. ord., *Cupuliferaæ*; Tribe, *Coryleæ*. Allied to the Hornbeam.)

Hardy deciduous trees. Seeds, which, if sown in the spring, the season after being gathered in the autumn, and kept in a rot-heap during winter, will make their appearance the year follow-

ing; layers, cuttings, and grafting on the common Hornbeam; good, deep, moist soil.

- O. carpinifolia*. Greenish-white. May. S. Europe. 1724. Syn., *O. vulgaris*.
— *virginica*. 20. April. N. Amer. 1622.
— *vulgaris*. Wats. Dendr. t. 143. See *O. carpinifolia*.

Oswego Tea. *Monarda didyma*.

Osyris. Poet's Cassia. (From *ozos*, a branch; referring to the numerous pliant branches. Nat. ord., *Santalaceæ*. Allied to *Santalinum*.)

Greenhouse evergreen shrub. Cuttings of ripened shoots under a hand-light in spring; sandy loam; requires the protection of a cold pit in winter, or a conservatory wall.

- O. alba*. 3. White. South Europe. 1739. Sibth. Fl. Gr. t. 954.

Otacanthus. (From *ote*, sometimes, and *acantha*, a thorn. Nat. ord., *Acanthaceæ*; Tribe, *Ruellieæ*.)

Stove shrub. For cultivation, see RUELLIA.
O. caeruleus. Violet, blue. Brazil. 1862. Fl. Ser. t. 1526.

Otaheite Chestnut. *Inocarpus edulis*.

Otaheite Myrtle. *Securinega nitida*.

Otandra. A synonym of *Geodorum*.

Othe'ra. (Said to be from the Japanese name. Nat. ord., *Ilicineæ*. Closely allied to *Ilex*.)

Hardy shrub, requiring the same culture as ILEX.

- O. japonica*. White. Japan.

Othonna. Ragwort. (From *othone*, linen; referring to the soft, downy clothing of the leaves. Nat. ord., *Compositæ*; Tribe, *Senecionideæ*.)

Greenhouse, yellow-flowered plants, from the Cape of Good Hope, except where otherwise mentioned. Seeds in a mild hotbed, in spring; annuals may be hardened off afterwards; perennials, by division of the plant; tuberos-rooted, by dividing them; shrubs, by cuttings of half-ripened shoots in sand, under a glass, in May; sandy loam, and a little fibry peat. Winter temp., 40° to 48°.

ANNUAL.

- O. tagetes*. 1. May. 1823.

HERBACEOUS.

- O. crassifolia*. Yellow. S. Africa. 1870. Trailing, basket plant.
— *linifolia*. 2. July. 1824.
— *pinnata*. 3. May. 1759. B. M. t. 768.
— *pinnatifida*. 1. July. 1523.

TUBEROUS-ROOTED.

- O. bulbosa*. 2. May. 1774.
— *filiculis*. 1½. April. 1791.
— *tuberosa*. August. 1842. B. M. t. 4038.

EVERGREEN SHRUBS.

- O. abrotanifolia*. 3. May. 1692. B. R. t. 108.
— *arborescens*. 2. July. 1723.
— *Athanasia*. 3. January. 1795.
— *carnea*. ¾. Yellow. S. Africa. 1867.
— *cheirifolia*. B. R. t. 266. See *Othonnopsis cheirifolia*.

- O. coronopifolia*. 2. August. 1731.
 — *denticulata*. 2. June. 1774. B. M. t. 1979.
 — *digitata*. 1½. July. 1824.
 — *labellifolia*. B. C. t. 728. A synonym of *Euryops virginicus*.
 — *furcata*. Pale yellow. January. Island of Ichaboe, Africa. 1844. Syns., *Ceradia furcata* and *Doria Ceradia*.
 — *heterophylla*. 2. May. 1812.
 — *pectinata*. B. M. t. 306. A synonym of *Euryops pectinatus*.
 — *perfoliata*. 1½. June. 1789. Jacq. H. Schoenb. t. 240.
 — *tenuissina*. 1½. May. 1759.
 — *triplinervia*. 5. Yellow. S. Africa. 1862.
 — *virginica*. A synonym of *Euryops virginicus*.

Othonno'psis. (From *Othonna*, and *opsis*, like; resembling the genus *Othonna*. Nat. ord., *Compositæ*; Tribe, *Senecionideæ*.)

Greenhouse shrub. For culture, see OTHONNA.

- O. cheirifolia*. 1½. Yellow. May. Barbary. 1752. Syn., *Othonna cheirifolia*. B. R. t. 266.

Oti'dia. A section of **Pelargonium**.

Otorhynchus sulcatus. This insect pest is figured and described as *Curculio sulcatus* on p. 281, where it is only noted as being destructive to succulent plants; but it also attacks many shrubs and trees, peeling off patches of the bark, and doing other damage. The only remedy that is likely to have any effect in preventing their ravages is to lay a sheet, or any other white cloth, under the infected shrubs, which should be well shaken late at night, when the beetles are feeding; they will then fall down on the cloth and simulate death, when they should be at once killed.

Otochilus. (From *ous*, *otos*, the ear, and *cheilos*, a lip; the lip has ear-like appendages. Nat. ord., *Orchideæ*.)

Intermediate stove, epiphytal orchids. Peat fibre, charcoal, sphagnum.

- O. fra'grans*. White. June. Nepaul. 1836. Syn., *Tetrapeltis fragrans*.
 — *fu'sca*. Brownish; lip golden, rose. August. Nepaul. 1840. B. M. t. 3921.

Oto'ptera. (From *ous*, an ear, and *pteron*, a wing; referring to an ear-like process on the wing-petals. Nat. ord., *Leguminosæ*; Tribe, *Phaseoleæ*.) See **Vigna**.

O. Burchellii. See **Vigna Burchellii**.

Otostegia. (From *ous*, ear, and *stegos*, roof. Nat. ord., *Labiata*; Tribe, *Satureiæ*.)

Half-hardy evergreen. For culture, see CALAMINTHA.

- O. scario'sa*. ¾. Purple. August. Spain. 1752. Syn., *Calamintha fruticosa*.

Otostemma. (From *ous*, an ear, and *stemma*, a crown. Nat. ord., *Asclepiadaceæ*.) A synonym of **Hoya**.

O. lacuno'sa. A synonym of *Hoya lacunosa*.

Ottelia. (Supposed to be from *Ottel*, the native name in Malabar. Nat. ord., *Hydrocharideæ*.)

Stove or greenhouse aquatic herbs. Propagated by seeds.

- O. indica*. White. August. East Indies. 1800. Syn., *Damasonium indicum*. B. M. t. 1201.

- *ovatifolia*. Green, pale yellow. Summer. Australia. 1883. G. C. 1886, xxv. p. 753.

Otter Moth. *Hepialus Hu'muli*. Also known as the Ghost Moth, or Ghost Swift. These moths emerge from the dark-brown pupæ about the beginning of June. The males, which are about two inches across, are silvery above, fringed with brown and tawny beneath. The females are slightly larger, and yellow above with orange markings. Both after hiding amongst herbage during the day fly in the evening. Long grass, nettles, etc., should therefore be removed from the vicinity of the crops which they attack. The principal injury they occasion is to the Hops by their caterpillars, which are cream-coloured with brown heads, preying upon the roots. When their presence is suspected, the roots should be examined and the caterpillars destroyed, either by hand-picking (which can be readily done, on account of their large size—an inch and a half long) or by watering the crop with some insecticide.

Ouri'sia. (Perhaps from *ourios*, a beneficial breeze; natives of mountains. Nat. ord., *Scrophulariaceæ*.)

Hardy perennial, but best cultivated in a cold frame. For cultivation, see CHELONE.

- O. coeci'na*. Scarlet. Andes of Chili. 1862. B. M. t. 5385.

- *Pea'rcii*. Crimson, scarlet. Chili. 1863.

There are several other species, all beautiful, but we are not aware of their being in cultivation.

Ouvira'ndra. (From *ouvirandrano*, the native name, signifying water-yam, the roots being eatable. Nat. ord., *Naiadaceæ*; Tribe, *Aponogetoneæ*.) United with **Aponogeton** in the Genera **Plantarum**.

The Lattice or Lace-leaved plants are stove aquatics. Their leaves are merely a network of vascular tissue, resembling lace, or, as the specific name of one intimates, a lattice window. In Madagascar they grow on the margin of streams. In a stove aquarium, they require the water of a temperature from 70° to 75°; the soil for them to root in being sandy loam. Seeds and division of the roots.

- O. Bernieria'na*. 2. Pink. August. Madagascar. 1858.

- *fenestra'tis*. 2. White. August. Madagascar. 1855.

Ovary. That part of the flower in which the ovules, or young seeds are produced. Like the rest of the flower it

consists of one or more leaves modified for a special purpose, which in this case is that of bearing seeds. In a simple case this modified leaf, or *carpel*, is rolled over, its margins are turned in, united, and bear the *ovules*, e.g., the Pea. In *Helleborus* there are several such carpels, each distinct from the other. In the Violet these carpels are united by their in-turned margins, thus inclosing a central cavity on the wall of which are three lines of ovules; these lines representing the *placentas*, or swollen margins of two adjacent carpels. This arrangement is known as *parietal placentation*. The Lily presents a more complicated arrangement, in which the carpels unite, and then their margins grow towards the centre of the cavity thus formed, there unite and recurve to bear the ovules, thus forming three cavities, instead of one, as in the Violet. This is known as *axile placentation*. The portions of the carpellary leaves, which in the last case divided the ovary into several cells, occasionally becomes absorbed, leaving a one-celled ovary with the ovules attached to a central column, as in the Pink and other Caryophyllaceæ. This is termed *free-central placentation*. In a few cases the ovule is produced from the floral axis, instead of from the margins of the carpels. This occurs in Polygonum, where a solitary ovule is contained in an ovary formed of three united carpels as in the Violet. Other differences are produced by the calyx or perianth being united with the wall of the ovary or free from it. In the former case the ovary is said to be *inferior*, e.g., Umbelliferæ, Compositæ, Orchideæ, Irideæ, Amaryllideæ, and certain Rosaceæ (Pyrus); in the latter case it is *superior*, e.g., Violaceæ, certain Rosaceæ (Cerasus), Scrophulariaceæ and Liliaceæ.

Ovule. That structure contained in the ovary, which after fertilization develops into the seed. It is borne on a stalk (*funicle*) and surrounded (generally) by two coats, the *primine* and *secundine*, through which at one point a hole (*micropyle*) exists to facilitate the entrance of the pollen tube. The central portion is termed the *nucleus*, in which exists the *embryo sac*, containing the *embryo* (oosphere) and *endosperm*. It is by the development of this endosperm that the *albumen* of some seeds is formed, although in some plants it is formed outside the embryo sac and is then distinguished as *perisperm*; both kinds are present in the seeds of Nym-

phæa. The ovule may be straight, *orthotropous*, e.g., Polygonum, inverted with adnate funicle (*raphe*), *anatropous*, e.g., Ranunculus, or curved, *campylotropous*, e.g., Leguminosæ.

Oxalis. Wood Sorrel. (From *oxys*, acid; and the acid taste of the leaves. Nat. ord., *Geraniaceæ*; Tribe, *Oxalideæ*.)

Natives of South Africa, except where otherwise stated. Hardy annuals, seed in open border, in April, in a shady place; perennials, by division and by seeds; tuberous and bulbous ones, by offsets; the tender ones succeed in a cool temperature in winter, if dry, and frost excluded; shrubby species, by seeds and cuttings in sandy soil, under a bell-glass, and grown in sandy loam and fibry peat; all the bulbous kinds the least tender should be kept dry in winter, and the shrubby have the greenhouse.

HARDY ANNUALS.

- O. corniculata*. ½. Yellow. August. Britain.
Dillenit. 2. Copper. America. 1798.
 — *florida*. 2. Yellow. America. 1798.

O'xalis De'ppei Culture.—Plant bulbs of this in pots at the beginning of March, and shelter in a cold pit or greenhouse. When all fear of frost is passed, plant them in a light soil, and in a southern aspect, about twelve inches apart each way; or the bulbs may be kept out of the ground altogether until the middle of April, and then be planted at once in the open soil. It should be trenched, and a little manure turned in

with the bottom spit, as for other tap-rooted crops. The scaly bulbs, from which it is propagated, grow in a cluster round the crown of the root. The only cultivation required is to keep the crop free from weeds, and to water plentifully in dry weather; otherwise, if the roots are allowed to become dry, they split upon the occurrence of moist weather. Protect from early frosts, in October or November, by a mat covering.

About ten roots are enough for a dish. They are very useful as a vegetable from early in October to the end of December. An inferior kind has often been substituted for it, viz., the *Oxalis Jacquiniana*; but this is distinguished by having pink flowers. In Belgium, the leaves, being gratefully acid, are used for the same purposes as sorrel, and the flowers are mixed with other salad-herbs.

As it is not a very common vegetable, it may be useful to state, as an improved mode of cooking, that after peeling the tubers, and cleaning out their hollow centres, they must be well boiled in rich stock (gravy), skimming off the fat, and then be served up hot, with a sauce made of a little butter heated until brown, with a spoonful of flour, and a little of the stock.

Oxe-eye. *Buphtha'lmum.*

Oxe-eye Daisy. *Chryso'nthemum leuca'nthemum.*

Ox-lip. *Pr'imula elat'ior.*

Oxe'ra. (From *oxeros*, sour; referring to the taste. Nat. ord., *Verbenaceæ.*)

A handsome stove climber, with large showy flowers, abundantly produced.

O. pulche'lla. Greenish-white. New Caledonia. 1886. B. M. t. 6938.

Oxya'nthus. (From *oxys*, sharp, and *anthos*, a flower; referring to the sharp-toothed calyx and corolla. Nat. ord., *Rubiaceæ*; Tribe, *Gardenieæ*. Allied to *Gardenia*.)

Stove, white-flowered, evergreen shrubs, from Sierra-Leone. Cuttings of young shoots, a little firm, in sand, under a bell-glass, in bottom-heat, in May; sandy loam, fibry peat, and a little dried cow-dung. Winter temp., 45° to 55°; summer, 60° to 85°.

O. hirsu'tus. 2. July. 1812.
— *specio'sus.* B. M. 1992. A synonym of *O. tubiflorus*.

— *versicolor.* July. Cuba, or Tropical Africa? 1839. Fl. Ser. t. 148.

Oxy'baphus. Umbrellawort. (From *oxys*, acid, and *baphe*, dyer's colour; referring to the coloured juice of the roots. Nat. ord., *Nyctaginaceæ*; Tribe, *Mirabilieæ*. Allied to the Marvel of Peru.)

All purple-flowered, except where otherwise stated. Seeds in May, in the open border, but better in mild hotbed, in March, and planted out in the end of April; also, by division of the plant in spring; sandy loam; they all require dry places, and protection from severe frost in winter.

— *viola'ceus.* 1. Violet. July. Cumaná. 1820. Syn., *Allionia violacea*.

Oxycco'cus. Cranberry. From *oxys*, acid, and *kokkos*, a berry. Nat. ord., *Vacciniaceæ*; Tribe, *Euvaccinieæ.*)

Hardy, pink-flowered evergreens. Seeds, but generally by dividing the plants, by layering the shoots, by merely placing sandy peat around them, and by cutting off the points of shoots, and inserting them in sandy peat, under a hand-light, in summer. Marshy, peaty soil, such as a bed surrounded with water. The Cranberry, however, has been grown successfully in a bed on a north border, without any water round it, and the produce was good and plentiful. *Macrocar'pus* produces the largest fruit. See AMERICAN CRANBERRY.

O. cre'tus. May. N. Amer. 1806. Wats. Dendr. t. 31.

— *erythroca'rpus.* See *Vaccinium*.

— *macroca'rpus.* †. May. N. Amer. 1760. Wats. Dendr. t. 122.

Oxyde'ndron. (From *oxys*, acid, and *dendron*, a tree; the leaves have an acid taste. Nat. ord., *Ericaceæ.*)

Hardy tree. Soil moist and peaty. Imported seeds.

O. arbo'reum. 15-40. White. Summer. Eastern United States. 1762. Syn., *Andromeda arborea*, B. M. t. 905.

Oxygo'nium. (From *oxys*, sharp, and *gonu*, an angle; referring to the divisions of the leaf, or frond. Nat. ord., *Filices*.) Now united to *Asplenium*.

Stove, brown-spored ferns, from the East Indies. See FERNS.

O. alismaefo'lium. April.

— *e'legans.* June. 1842.

— *ova'tum.* May. 1842.

— *vittaefo'rme.* June. 1840.

Oxylo'bium. (From *oxys*, sharp, and *lobos*, a pod; the seed-pods ending in a sharp point. Nat. ord., *Leguminosæ*; Tribe, *Podalyrieæ*. Syns., *Callistachys* and *Podolobium*.)

Greenhouse, yellow-flowered evergreen shrubs, from Australia. Seeds sown in a mild hotbed in April, after being soaked in warm water;

cuttings of young shoots, not too firm, in sand, under a bell-glass, in April or May; sandy peat, a few bits of fibry loam, a greater quantity of charcoal, broken crocks, etc., and abundant drainage. Winter temp., 40° to 48°.

 — *solano'ides*. 3. Purplish-scarlet. 1847. B. M. t. 4367.

Oxyramphus. (From *oxys*, sharp, and *rhamphos*, a beak; shape of the seed-pod. Nat. ord., *Leguminosæ*; Tribe, *Hedysarææ*. Allied to *Desmodium*.) A synonym of *Lespedeza*.

Greenhouse evergreen shrub. Cuttings of young shoots in sand, under a bell-glass and seeds sown in spring; sandy, fibry loam, and a

little peat and leaf-mould. Winter temp., 40° to 50°.

- O. macrostyla*. 4. Purple, crimson. October. Saharanpoor. 1837. B. R. 1846, t. 28.

Oxyspora. (From *oxys*, sharp, and *spora*, a seed, which is here awned at both ends. Nat. ord., *Melastomaceæ*; Tribe, *Oxysporeæ*. Allied to *Rhexia*.)

Stove evergreen shrub. Cuttings of young shoots in sandy soil, under a glass, in bottom-heat, in April; sandy peat, fibry loam, and nodules of charcoal. Winter temp., 50° to 60°; summer, 60° to 85°.

- O. paniculata*. 3. Red. June. Nepaul. 1826. B. M. t. 4553.
 — *va'gans*. A synonym of *O. paniculata*.

Oxystelma. (From *oxys*, sharp, and *stelma*, a crown; referring to the acute little leaves accompanying the flower-head, or crown. Nat. ord., *Asclepiadaceæ*; Tribe, *Cynanchææ*. Allied to *Philibertia*.)

Stove evergreen climber. Cuttings of half-ripened shoots in sand, under a bell-glass, and in bottom-heat, in May; sandy peat and fibry loam. Winter temp., 50° to 60°; summer, 60° to 85°.

- O. esculentum*. 4. Yellow. E. Ind. 1816.

Oxytropis. (From *oxys*, sharp, and *tropis*, a keel; the keel-petal ends in a sharp point. Nat. ord., *Leguminosæ*; Tribe, *Galegeææ*. Allied to *Astragalus*.)

Hardy herbaceous perennials, from Siberia, except where otherwise stated. Chiefly by seeds, sown where the plants are intended to remain, as they do not transplant well; though, also, by dividing the plants in spring, and by cuttings of young shoots under a hand-light, in a shady place, in summer; dry, sandy loam.

P.

Pachira. (From the native name in Guiana. Nat. ord., *Malvaceæ*. Syn., *Carolineæ*.)

Stove trees. Cuttings of ripened wood in sand, under a bell-glass, in heat; rich loamy soil. Summer temp., 60° to 85°; winter, 50° to 55°.

- P. alba*. 20. July. Brazil. 1817. B. M. t. 4508. Syn., *Carolineæ alba*, B. C. t. 752.
aquatia. 30. Red, yellow, green. West Indies. 1787. Syn., *Carolineæ princeps*.
insignis. 20. Red. West Indies. 1796. Syn., *Carolineæ insignis*, B. C. t. 1004.
macrocarpa. 30. Red, yellow, green. Mexico. B. M. t. 4549. Syn., *Carolineæ macrocarpa*.
minor. 20. Red, yellow, green. July. Guiana. 1798. Syn., *Carolineæ minor*, B. M. t. 1412.

Pachyphilus. (From *pachys*, thick, and *cheilos*, a lip. Nat. ord., *Orchideæ*; Tribe, *Epidendræ-Eriæ*.) A synonym of **Pachystoma**.

Pachylophus. (From *pachys*, thick, and *lophos*, a crest. Nat. ord., *Onagrariæ*.) A synonym of **Cenothera**.

Pachyne'ma. (From *pachys*, thick, and *nema*, a filament. Nat. ord., *Dille-niaceæ*.)

Glabrous, half-hardy herb, with the leaves reduced to scales.

P. complanatum. Yellow. Australia.

Pachyphyllum. (From *pachys*, thick, and *phyllon*, a leaf. Nat. ord., *Orchideæ*; Tribe, *Vandææ-Sarcantheæ*. Allied to *Luisia*.)

Cuttings of the young shoots any time during spring and summer, drying them at the base, and inserting them in sandy loam; sandy loam, a little brick-rubbish, and dried cow-dung; little water and plenty of light are required in winter. See *ORCHIDS*.

P. procumbens. Green, blue. May. Andes of S. America. 1836.

Pachypodium. (From *pachys*, thick, and *podion*, a foot; referring to the stalks of the flowers. Nat. ord., *Apocynaceæ*. Allied to *Nerium*.)

Greenhouse evergreens, from the Cape of Good Hope, with white and red flowers. Cuttings of young shoots in spring, base dried before inserting in dryish, sandy soil; sandy loam, a little brick-rubbish and peat, but little water in winter. Winter temp., 40° to 45°. Propagated also by a division of the fleshy, tuber-like roots.

- P. succulentum*. 1. May. 1823.
tuberosum. 1. August. 1813. B. C. t. 1676.

Pachyphytum. See **Cotyledon**.

Pachyrhizus. (From *pachys*, thick, and *rhiza*, a root. Nat. ord., *Leguminosæ*.)

Stove, twining herbs. Cuttings in sand under a bell-glass; tubers; seeds.

P. angulatus. Violet-purple. July. Tropics. 1781.

— *Thunbergiana*. See *Pueraria Thunbergiana*.

Pachysandra. (From *pachys*, thick, and *aner*, a stamen. Nat. ord., *Euphorbiaceæ*. Allied to *Buxus*.)

Division and suckers; common, sandy loam. The stove under-shrub, by cuttings in a little heat, but otherwise requiring no particular treatment. The herbaceous, by division in spring; sandy loam and peat.

- P. coriacea*. See *Sarcococca prunifolia*.
procumbens. †. White. April. N. Amer. 1800. Hardy herbaceous. B. M. t. 1964.
terminalis. Leaves with whitish variegated margins. Japan. 1882.

Pachystigma pteleoides, Ic. Pl. t. 698. See **Peltostigma pteleoides**.

Pachystima. (From *pachys*, thick, and *stigma*; alluding to the thick stigma. Nat. ord., *Celastrinæ*.)

Hardy, evergreen, shrubs. For culture, see *MYGINDA*.

- P. Canbyi*. Greenish. California. 1889.
myrsinites. †. White. June. N. Amer. 1818. Syn., *Myginda myrsifolia*.

Pachystoma. (From *pachys*, thick, and *stoma*, a mouth; referring to the thick lip. Nat. ord., *Orchideæ*; Tribe, *Epidendræ-Eriæ*. Allied to *Eria*.)

P. speciosum given below is a doubtful member of this genus; it appears to be a stove epiphyte, and probably requires the same treatment as *ERIA*. But those which are genuine members of the genus, none of which appear to be in cultivation, are stove terrestrial Orchids, growing naturally in grassy places; so that should they be introduced they will require to be grown in turfy loam.

P. speciosum. Yellow. January. Ceylon. 1866.

Syn., *Ipeea speciosa*. B. M. t. 5701.

— *Thomsonia num.* †. White, red-purple. W. Tropical Africa. Autumn. 1879. B.M. t. 6471.

Pa'dus. See Prunus.

Pæderia. (From *pæderos*, opal; referring to its transparent berries. Nat. ord., *Rubiaceæ*; Tribe, *Pæderiaceæ*.)

Stove evergreen shrub. Cuttings in sand, in summer, in a little bottom-heat, under a glass; sandy loam and leaf-mould. Winter temp., 48° to 55°; summer, 60° to 80°.

P. fœtida. 6. Purple. Tropical Asia. 1806.

Pæderota. (From *Paideros*, an ancient name for a species of *Acanthus*. Nat. ord., *Scrophulariaceæ*.)

Hardy, perennial, dwarf herbs. Light sandy soil. Seeds.

P. Ageria. †. Yellow. May. Mountains of Central Europe. 1824.

— *bonarota*. †. Blue. May. Mountains of Central Europe. 1818.

Pæonia. Pæony. (Named after *Pæon*, a physician, who first used it medicinally. Nat. ord., *Ranunculaceæ*; Tribe, *Pæoniaceæ*.)

Seeds for raising varieties, sown in September, in a cold pit, will appear some the first, and others the second, spring. Herbaceous kinds, by division of the roots. Tree, or Moutan, by division; by grafting on the herbaceous roots; by cuttings of the young shoots in spring, under a glass, and in a little heat; by layers and suckers; by layering young shoots, after ringing round each bud, so that each bud forms a plant; deep, good loam. The Moutans require a little protection in spring; do well for forcing, and for the borders of large, cool conservatories, where the temperature is not kept high in winter.

HARDY SHRUBS.

P. Moutan. 3. Purple. May. China. 1789.

 Abcharia. 1842. B. M. t. 6645.

Pagle. The Cowslip. *Pri'mula*
ve'ris.

Pagoda Tree. *Ficus india*, *Plu-*
meria a'ba, and *So'phora japo'nica*.

Painted Cup. *Castille'ja*.

Painted Grass. *Aru'ndo*.

Palafox'ia. (Named after *Palafox*,
 a Spanish general. Nat. ord., *Com-*
positæ; Tribe, *Helenioideæ*. Allied to
Stevia.)

Herbaceous perennials, with white flowers.
 Seeds, divisions, and cuttings of the youngshoots
 in spring; sandy loam. A cool greenhouse or
 cold pit in winter for *linea'ris*.

- P. fastigia'ta*. August. N. Amer. 1823. Hardy.
Hookeria'na. Pink. Rocky Mountains. 1865.
 B. M. t. 5849.
 — *linea'ris*. 2. June. Mexico. 1821. Green-
 house. B. M. t. 2132. Perennial.

Pala'va. (After *A. Palau y Verdera*,
 once a professor of botany at Madrid.
 Nat. ord., *Malvaceæ*.)

Hardy, or half-hardy annuals. Common gar-
 den-soil. Seeds in a hotbed in spring; the seed-
 lings planted out in May.

- P. flexu'sa*. ¾. Mauve. June. Peru. 1866.
 B. M. t. 5768.
 — *malvaefolia*. Pink. South America.
 — *rhombifolia*. Prostrate. Rose. Summer.
 Peru. 1830. B. M. t. 3100.

Pale-brindled Beauty Moth.
Geome'tra.

Palicou'rea. (Named after *Le Pali-*
cour, of Guiana. Nat. ord., *Rubiaceæ*;
 Tribe, *Psychotriæ*. Allied to *Psychotria*.)

Some of the species are used for killing rats
 and mice in Brazil. Stove evergreen shrubs.
 Cuttings in spring, in sand, under a glass, in a
 gentle hotbed; sandy loam and peat.

- P. apica'ta*. 4. Yellow. July. Caraccas. 1824.
 — *cro'cea*. 4. Orange. July. W. Ind. 1823.
 — *discolor*. See *P. nicotianaefolia*.
 — *gardenioi'des*. 2. White. Winter and sum-
 mer. S. America. Syn., *Rhodostoma*
gardenioides.
 — *juga'sa*. Leaves satiny green above, purple
 beneath. Brazil.
 — *lutea*. 1. Yellow. June. Guiana. 1823.
 Syn., *Nonatelia lutea*.
 — *nicotianaefolia*. Pale yellow. September.
 Brazil. Syn., *P. discolor*.
 — *orna'ta*. Leaves olive-green with crimson
 veins. South America. 1875.
 — *pave'tta*. 2. White. August. W. Ind. 1823.
 — *racemo'sa*. 3. White. June. Guiana. 1818.
 Syn., *Nonatelia racemosa*.

- P. ri'gida*. 3. Yellow. August. Caraccas. 1820.
 — *viola'cea*. 4. White. June. Guiana. 1824.
 Syn., *Nonatelia violacca*.

Paliso'ta. (Dedicated to *Palisot de*
Beauvois, a botanist and traveller. Nat.
 ord., *Commelinaceæ*; Tribe, *Polliceæ*.)

Stove evergreen perennial herbs. For culti-
 vation, see *COMMELINA*.

- P. Barte'ri*. Purple. Fernando Po. 1862. B.
 M. t. 5318.
 — *bi'color*. Leaves green with paler disc, brown-
 woolly beneath. Fernando Po. 1878.
 — *bracteo'sa*. Whitish. W. Tropical Africa.
 1879.

Paliu'rus. Christ's Thorn. (Name
 of a plant used by *Dioscorides*. Nat.
 ord., *Rhamnaceæ*; Tribe, *Zizyphææ*.
 Allied to *Zizyphus*.)

Hardy deciduous shrubs, with greenish-yellow
 flowers. Suckers, which come freely; layers,
 cuttings, and seeds. *P. Auble'tia* is an elegant
 shrub. The other, from its abundance in
 Judea, is supposed to be the plant from which
 our Saviour's crown of thorns was made; com-
 mon garden-soil.

- P. aculeat'rus*. 4. June. South Europe. 1596.
 Syn., *P. australis*.
 — *Auble'tia*. 6. August. South China. 1817.
 Syn., *P. virgat'us*, B. M. t. 2535.

Palla'sia. (After *Pallas*, a Russian
 botanist. Nat. ord., *Compositæ*; Tribe,
Helianthoideæ.) See *Encelia*.

- P. grandifl'ora*. A synonym of *Encelia halimi-*
folia.
 — *halimifolia*. A synonym of *Encelia canescens*.

Palle'nis. (From *palea*, chaff; the
 receptacle is furnished with chaffyscales.
 Nat. ord., *Compositæ*; Tribe, *Inuloi-*
deæ.)

Hardy, annual herb. For culture, see *BUPH-*
THALMUM.

- P. spin'o'sa*. 2½. Yellow. July. South Europe.
 1870. Syn., *Buphthalmum spinosum*.
 Sibth. Fl. Gr. t. 898.

Palm. Any plant belonging to the
 order *Palmeæ*.

Palma Christi. *Ri'cinus commu-*
nis.

Palm, Cabbage. *Oreodo'æ ole-*
ra'cea.

Palm, Date. *Phœ'nix dactyli'fera*.
Palmetto, Cabbage. *Sa'bal*
Palme'tto.

Palmetto, Dwarf. *Sa'bal Adan-*
sonii.

Palmetto Palm. *Sa'bal Palme'tto*.

Palmetto, Saw. *Sereno'a serrula'ta*.

Palm, Fan. *Sa'bul Blackburnia'na*.

Pal'mia. (After *L. H. Palm*, a
 botanical author. Nat. ord., *Convolvu-*
laceæ.) See *Hewittia*.

- P. bico'lor*. See *Hewittia bicolor*. *Convolvulus*
bicolor of B. M. t. 2205 is a synonym of
 this.

Palmit'e. See *Pri'o'nium Palmi'ta*.

Palm Oil. A product of *Elæ'is*.

Palm, Patana. *Enoca'rpus Bata'ua*.

Palm, Savanah. *Sa'bal mauriticia-fo'rmis*.

Palm, Thatch. *Sa'bal Blackbur-nia'na*.

Palmyras Tree. *Bora'ssus flabel-lifo'rmis*.

Palsy-wort. *Pri'mula ve'ris*.

Palumbi'na. (From *palumbes*, a wood-pigeon; the flowers are supposed to resemble that bird. Nat. ord., *Orchi-deæ*; Tribe, *Vandææ-Oncideæ*.)

Stove orchid. For culture, see *ONCIDIUM*.

P. ca'ndida. ½-1. Pure white; lip spotted with red. Summer. Mexico. 1843. Syn., *Oncidium candidum*, B. M. t. 5545.

Pampas Grass. *Gyne'rrium arge'n-teum*.

Panæ'tia. (Derivation not explained. Nat. ord., *Compositæ*; Tribe, *Inuloideæ*.) See *Podolepis*.

P. Lesso'nii. See *Podolepis Lessonii*.

Pa'nax. (From *pan*, all, and *akos*, remedy; referring to the stimulant drug, Ginseng, to which miraculous virtue is ascribed by the Chinese. Nat. ord., *Araliaceæ*.)

Stove, greenhouse, or hardy trees or shrubs. Cuttings of young shoots under a hand-light, in epring and summer; sandy loam and fibry peat.

P. arma'tum. India. 1876. Syn., *Aralia armata*.

— *conchifo'lum*. 10. Yellow. India. 1820. Stove evergreen.

— *crassifo'lum*. See *Pseudopanax crassifolia*.

— *crispa'tum*. Leaves pinnate. Brazil. 1888.

— *diffu'sum*. Leaves bipinnate, triangular. Poly-nesia. 1883.

— *disse'ctum*. Leaves bipinnate, drooping. 1882.

— *dum'o'sum*. Probably a synonym of *P. fruti-cosum*, var. *Delanana*.

— *e'legans*. 1880.

— *fi'ssum*. Leaves tripinnate. Polynesia. 1884.

— *frutico'sum*. 10. Java.

— *Delana'na*. III. Hort. t. 492. Syn., *Aralia Delanana*.

— *multifida'm*. Leaves tripinnatisect. 1887.

— *ho'rridum*. See *Fatsia horrida*.

— *lacinia'tum*. Polynesia. 1877.

Hort. 1874, p. 248.

P. spinosa. See *Aralia pentaphylla*.

— *Victo'riæ*. Leaves ternate, edged with white. Polynesia. 1883. G. C. 1883, xix., p. 404, fig. 60.

Pancra'tium. (From *pan*, all, and *kratys*, potent; supposed medicinal qualities. Nat. ord., *Amaryllideæ*; Tribe, *Pancreaticeæ*. Allied to *Hymenocallis*.)

Handsome bulbs, and white-flowered, except where otherwise mentioned. Seeds for new varieties, as well as for perpetuating the older; chiefly by offset-bulbs; sandy loam, fibry peat, and rotten cow-dung. Temp. for stove kinds, winter, 50°; summer, 60° to 90°. Even the hardy kinds require a little protection in severe weather.

P. ama'num of Herbert is a synonym of *Hymenocallis ovata*; of Salisbury is a synonym of *Hymenocallis caribæa*.

Panning is forming a pan or basin in the soil round the stem of a tree or shrub, in which to pour water.

Pansy. (*Viola tricolor*.) The native situation of the wild Pansy is generally in fields of growing corn, where it is partially shaded from the wind and the heat of the midday sun. To grow the Pansy for the purpose of exhibition, the situation for the plants should also be one sheltered from all cutting winds, as these are very destructive, often injuring, and even killing, the plants close to the soil, by twisting them about. The situation should be open to the free circulation of the air, and exposed to the morning sun, but protected from the full influence of the midday sun, which injures the colour of the blooms. The plants should be placed together in beds made for the purpose. The situation should be cool and moist, but thoroughly drained; for although the Pansy requires considerable

moisture during the blooming season, and through the summer months, yet it is very impatient of superabundant moisture, and the plants will be found never to do well when the soil becomes in any degree sodden.

The *Soil* should be rich and tolerably light. Decayed cucumber-bed dung is the best manure, and the soil a light, hazel loam, with a good portion of decayed turf from pasture land, thoroughly intermixed by frequent stirring and digging, and to three barrow-loads of this soil add one of the cucumber-bed manure two years old. Manure-water, particularly guano-water, applied during the blooming season, is very beneficial.

The *Plants* should be carefully selected for the purpose of producing blooms for exhibition, as it will be always found that when they have flowered well through one season, they never produce so fine blooms the second. Those who intend to grow the Pansy for exhibition should select young plants well established from cuttings for the purpose. For the spring exhibitions in May and June, select plants struck the previous autumn, in August and September; and for the autumn exhibitions in September, select plants struck early in the spring; and after these have produced their blooms, save them for store plants, to produce cuttings, always having a constant succession of young plants for the purpose of blooming.

Propagation.—The young side-shoots are to be prepared for cuttings, as the old, hollow stems seldom strike freely, and do not grow so strong for spring blooming. Take off a sufficient quantity of these side-shoots in August, or the beginning of September, and for autumn-blooming in April and May; insert these either under hand-glasses, or in pots placed in a cool frame in some good, light compost, mixed with a good quantity of silver-sand, taking care to keep them moderately moist, and shading them from hot suns.

The *Disease* to which the Pansy is most subject is a withering away suddenly, as if struck by something at the root. This disease has received various names, as *root-rot*, *decline*, etc.; but both cause and remedy are unknown. Old plants are much more subject to it than young ones, and it appears to be most prevalent during hot and dry seasons. When a plant is thus struck, which is indicated by a withering of the foliage, if it be a rare and choice kind, immediately take all the cuttings you can get, and strike them, as almost in-

variably the old plants die. Strong, stimulating manures are productive of this disease. As a preventive keep the surface of the soil frequently stirred.

Insects.—The worst foes of the Pansy are the slug and the snail. To destroy and keep away these vermin, water the bed late of an evening, in moist weather, with lime-water, and sprinkle the surface, pretty thickly with fresh wood-ashes. See **Agromyza**.

Box for exhibiting Blooms.—Dr. Lindley says, that the best-constructed box for exhibiting twenty-four Heart's-ease is made of deal, of the following dimensions: twenty inches long, one wide, and five inches deep; the lid made to un hinge; a sheet of zinc fitted inside, resting upon a rim; four rows of six holes each cut in the zinc at three inches apart; under each hole a zinc tube soldered to the plate, and intended to contain the water; the apertures to admit the flower made in the form of a key-hole, as it will admit part of the calyx, and keep the flower in a flat position. The outside may be painted green; but the zinc plate should be painted of a dead white.

Pansy Fly. *Agromyza*.

Pantiles. See **Bricks**.

Papa'ver. Poppy. (From *papa*, pap, or thick milk; referring to the juice. Nat. ord., *Papaveraceæ*; Tribe, *Eupapaveraceæ*.)

Seeds in March and April, where the plants are to remain; division of the roots of the perennial ones; light, rich, sandy loam.

Papa'ya. Papaw Tree. (From the native name. Nat. ord., *Passifloreæ*.) A synonym of *Carica*.

- P. Carica*. See *Carica Papaya*.
 — *gracilis*. Gf. t. 986. See *Carica gracilis*.

Paper Lights were never much employed, and, since the introduction of Whitney's and other compositions for rendering cloth semi-transparent, are still less likely to be employed. Cart-ridge paper is the best for the purpose. It should be damped before it is nailed upon the frame, because when dry it becomes taut. It may then be painted over with boiled linseed oil, in which a little white lead has been incorporated. In nailing on the paper, a strip of tape should be placed between the heads of the tacks and the paper, to check the tearing to which the paper is so subject.

Paper Mulberry. *Broussonetia papyra'cea*.

Paph'nia. (*Paphia*, a surname of Venus. Nat. ord., *Orchideæ*; Tribe, *Vandææ*—*Cyrtopodiææ*. Allied to *Maxillaria*.) A synonym of *Lycaste*.

 — *myosotoides*. 1½. Blue. September. Orient. 1838. Half-hardy.

Paradisanthus. (From *Paradeisos*, park, Paradise, and *anthos*, flower; in allusion to the beauty of the flowers. Nat. ord., *Orchideæ*.)

- To be grown in a mixture of peat, sphagnum, and charcoal, in an intermediate house.
P. bahiensis. White, purple. Xen. i. p. 30, t. 14. Syn., *Warrea bahiensis*.
 — *Mose'ni*. Green, brown, mauve, white, purple. Brazil. 1881.

Paradise, Grains of. The seeds of *Amo'mum Meleguet'a*.

Paradi'sia. St. Bruno's Lily. (From *Paradeisos*, a park, Paradise. Nat. ord., *Liliaceæ*. Syn., *Czakcia*.)

- Hardy, perennial herb. For culture, see ANTHERICUM.
P. Lilia'strum. 1-2. White, with a green spot on each perianth segment. June. S. Europe. 1629. Syn., *Anthericum Lilia'strum*, B. M. t. 318, and *Czakcia Lilia'strum*.

P. Liliastrum major. 6. Flowers larger than in the type. Syn., *Anthericum Liliastrum*, var. *majus*.

Paragra'mma. A synonym of **Poly-podium**.

Paraguay Tea, or Mate. *Ilex paraguayensis*.

Paranephe'lius. (From *para*, beside, and *nephele*, a cloud; in allusion to the great altitude at which it grows. Nat. ord., *Compositæ*; Tribe, *Senecionideæ*.) See **Liabum**.

P. uniflorus. B. M. t. 5826. See *Liabum uniflorum*.

Para Nut. *Bertholletia excel'sa*.

Para Rubber. *He'vea brazilie'nsis*.

Parasitic Plants are such as derive their nourishment from other living plants by rooting into their sap-vessels. Examples are—the Mistletoe and Dodder which attach themselves to the stems and branches of some plants; the Hypocistis and the Orobanche, or Broom Rape, affix themselves to the roots of others. The minute fungi which constitute the mildew are also parasites. There is some doubt whether the Ivy is at all parasitical; but whether it derives nourishment or not from trees, it certainly checks the respiration, and prevents the free access of light and air to those upon which it attaches. The orchidaceous plants which grow upon dead wood as readily as upon living timber are not parasites. See also **Saprophytes**.

Parastra'nthus. (From *para-strepho*, to invert, and *anthos*, a flower; referring to the inverted position of the flowers. Nat. ord., *Campanulaceæ*; Tribe, *Lobeliææ*.) See **Lobelia**.

P. simplex. See *Lobelia tutea*.

— *unidentatus*. See *Lobelia tenella*.

— *varifolius*. See *Lobelia varifolia*.

Paratro'pia. See **Heptapleurum**.

P. Teysmanniana. See *Heptapleurum polybotryum*.

— *venulosa*. See *Heptapleurum venulosum*.

Parda'nthus. (From *pardos*, a leopard, and *anthos*, a flower; referring to the spotted flowers. Nat. ord., *Irideæ*; Tribe, *Sisyrinchieæ*. Allied to *Aristea*.) A synonym of **Belamcanda**.

Half-hardy, herbaceous, orange-flowered perennial. Seeds or divisions in spring; rich, sandy loam; a sheltered border in winter.

P. chinensis. 2. Orange, with purple brown spots. China and Japan. 1759. B. C. t. 1874. Syns., *P. nepalensis*, *P. sinensis* and *Ixia chinensis*, B. M. t. 171. This is now known as **BELAMCANDA CHINENSIS**.

Pareira Brava Root. *Chonde'n-dron tomento'sum*.

Parina'rium. (From *parinari*, the Guianan name. Nat. ord., *Rosaceæ*; Tribe, *Chrysobalanææ*.)

The rough-skinned or grey plum is the produce of *P. excel'sum*. Stove evergreens. Cuttings of ripe shoots in spring, in sand, under a glass, in bottom-heat; sandy loam and dried leaf-mould. Winter temp., 50° to 55°; summer, 60° to 85°.

P. campe'stre. 6. Yellow. Guiana. 1824.

— *excel'sum*. 60. White. Sierra Leone. 1822.

— *macrophyllum*. 3. White. Sierra Leone. 1822.

Paring and Burning are never to be practised by the gardener, except for the purpose of charring the turf, and rendering porous the soil cut from the banks of clayey ditches. When this is carefully done, a serviceable dressing is obtained. But paring and burning, as a general practice, is extremely wasteful; and, though it may give a good crop immediately afterwards, never fails, by speedy exhaustion, to demonstrate how great has been the dispersion of carbonaceous matter.

Pa'ris. (From *par*, equal; alluding to the regularity of the plants. Nat. ord., *Liliaceæ*; Tribe, *Trilli'diææ*.)

Hardy perennial herbs, with creeping root-stocks, which may be divided to propagate the plants. Seeds also.

P. polyphylla. 1-2. Green, yellow. May. Himalayas. 1826.

— *quadrifolia*. 1. Yellowish-green. Spring. Britain. Eng. Bot. ed. 3, t. 1509.

Par'tium. A synonym of **Hibiscus**.

P. elatum. See *Hibiscus elatus*.

Parivo'ra. (The name in Guiana. Nat. ord., *Leguminosæ*; Tribe, *Amherstieæ*. Allied to *Amherstia*.) A synonym of **Eperua**.

P. grandiflora. See *Eperua grandiflora*.

Park, in the modern acceptation of the word, is an extensive adorned inclosure surrounding the house and gardens, and affording pasturage either to deer or cattle. But a park, strictly and legally, is a large extent of a man's own ground inclosed and privileged for wild beasts of chase by prescription or by royal grant.

Parke'ria. (Named after C. S. Parker, its discoverer. Nat. ord., *Filices*.) A synonym of **Ceratopteris**.

Stove ferns. See **FERNS**.

P. acrostichoides. A synonym of *Cryptogramme crispata*, var. *acrostichoides*.

— *Lockhartii* and *pteroïdes*. See *Ceratopteris thalictroides*.

Pa'rkia. Nitta-tree. (Named after Mungo Park, the African traveller.

Nat. ord., *Leguminosæ*; Tribe, *Parkieæ*. Allied to *Mimosa*.)

Stove evergreen trees, with crimson flowers. Cuttings of half-ripened shoots in sand, in heat, under a bell-glass, in May; sandy peat and loam. Winter temp., 48° to 50°; summer, 60° to 80°.

P. africana. 30. March. Sierra Leone. 1822. Syn., *P. uniglandulosa*.

— *biglandulosa*. Brownish-yellow, white. Malay Archipelago.

— *biglobosa*. W. Indies. Syn., *Inga biglobosa*. — *uniglandulosa*. See *P. africana*.

Parkinsonia. (Named after J. Parkinson, a botanical author. Nat. ord., *Leguminosæ*; Tribe, *Eucasalpinieæ*. Allied to *Colvillea*.)

Stove evergreen shrub. Seeds, when obtainable; cuttings of half-ripened shoots, treated like *PARKIA*.

P. aculeata. 12. Yellow. W. Ind. 1739.

Parmentiera. (Dedicated to A. Parmentier, a writer on edible plants. Nat. ord., *Bignoniaceæ*; Tribe, *Jacarandaceæ*.)

Stove tree. For cultivation, see *BIGNONIA*.

P. cereifera produces cylindrical fruit 2 to 3 feet long, of a waxy yellow colour, which hang down and look like large candles, whence the name "Candle-tree" has been given to it.

P. cereifera. White. Panama. 1866.

Parnassia. Grass of Parnassus. (Named after *Mount Parnassus*, where, from the elegance of these plants, they were fabulously said to have first sprung. Nat. ord., *Saxifragaceæ*; Tribe, *Saxifrageæ*.)

P. palustris is one of our prettiest British marsh plants. Hardy, herbaceous, white-flowered perennials. Seeds and divisions in spring; shady, marshy places.

P. asarifolia. $\frac{1}{2}$. July. N. Amer. 1812.

— *caroliniana*. $\frac{1}{2}$. May. N. Amer. 1802. B. M. t. 1459.

— *umbriata*. $\frac{1}{2}$. July. N. Amer.

— *nubiicola*. $\frac{1}{2}$ -1 $\frac{1}{2}$. Greenish, white. July. Himalayas. 1881. B. M. t. 6609.

— *palustris*. $\frac{1}{2}$. July. Britain. Eng. Bot. ed. 3, t. 565.

— *parviflora*. $\frac{1}{2}$. June. N. Amer. 1820.

— *speciosa*. $\frac{1}{2}$. July. N. Amer.

Parnassus, Grass of. *Parnassia palustris*.

Parochetus. (From *para*, near, and *ochetos*, a brook; its habitat. Nat. ord., *Leguminosæ*; Tribe, *Trifolieæ*. Allied to *Trigonella*.)

Half-hardy, evergreen, Nepalese creepers. Division in spring; cuttings under a hand-light, in summer; loam and leaf-mould. The protection of a cold pit in winter.

P. commutis. Purple. July. 1820.

— *major*. Lilac. June. 1827.

Paronychia. Whitlow-wort. (From *paronychia*, a whitlow; which it is thought to be a cure for. Nat. ord., *Ullcebraceæ*.)

Hardy tufted herbs. Seeds. Light sandy soil

P. argentea. Whitish. S. Europe. 1879. This plant yields the Sanguinaire, which in Algeria is used as a beverage.

— *serpyllifolia*. Silvery. Summer. S. Europe. 1882.

Parrot-beak Plant. *Clinanthus*.

Parrotia. (Named after M. Parrot. Nat. ord., *Hamamelidaceæ*. Allied to *Fothergilla*.)

Hardy deciduous trees. Cuttings of young shoots getting firm, in sand, under a glass, in spring; peat and loam. Should be grown in a light soil.

P. Jacquemontiana. 6-12. Cashmir.

— *persica*. 15. Scarlet. Leaves in autumn turning to bright orange, golden-yellow and scarlet. Persia. 1848. B. M. t. 5744.

Parrya. (Named after Captain Parry, the arctic navigator. Nat. ord., *Crucifereæ*; Tribe, *Arabideæ*. Allied to *Arabis*.)

Hardy perennial herbs. Seeds; common garden-soil.

P. arabidiflorum. $\frac{1}{2}$. Purple. May. Siberia. 1800. Syns., *Hesperis arabidiflora* and *Neuroloma arabidiflora*.

— *arctica*. $\frac{1}{2}$. Purple. Melville Island. 1820.

— *integerrima*. $\frac{1}{2}$. Rose, purple. April. Siberia. 1829. Evergreen.

— *nudicaulis*. Rosy-lilac. Arctic regions. Gfl. t. 1126. Syn., *Arabis nudicaulis*.

Parsley. (*Petroselinum sativum*.) There are two varieties, the Common Plain-leaved and the Curly-leaved.

Sow annually, once in February, and again in the end of June. Sow moderately thick, in narrow drills barely a quarter of an inch deep, twelve inches apart if in a bed by itself, or in a single one round the edge of a bed, the soil being raked level, and the stones immediately over the seed gathered off. The plants make their appearance in from two to six weeks. When two or three inches high, they may be gathered from as required. In early June, when they make a show for seed, the stems should be cut down close to the bottom, and again in September, if they have acquired a straggling, rank growth. This will cause them to shoot afresh, and acquire a strong growth before the arrival of severe weather. On the approach of frost, if protection is afforded to the plants by means of haulm or reed panels, so supported as not to touch them, it will preserve them in a much better state for use in winter and spring. But a still more effectual plan is to take up some of the strongest and best-curved plants in September, and plant them in pots, two or three plants in each, using a rich soil. If these be placed in a pit or greenhouse, and abundance of liquid manure given, they will be very superiorly productive throughout the winter.

To obtain Seed.—Allow some of the plants to run up in June; they should not, however, be allowed to stand nearer than eighteen inches to each other. The seed ripens in early autumn, and, when perfectly dry, may be beaten out and stored. Soot is an excellent manure for parsley, and preserves it from root-canker, the only disease affecting it.

Parsley Fern. *Cryptogramma crispa.*

Parsnip. (*Peucedanum sativum.*) The two varieties, Hollow-crowned and Guernsey, are nearly alike.

Soil.—A rich, dry, sandy loam, and the deeper the better. The most inimical to it is gravel or clay. Trench the ground two spades deep, a little manure being turned in with the bottom spit. In the Isle of Guernsey, which has long been celebrated for the fineness of its parsnips, sea-weed is the manure chiefly employed. Of dung, that of pigeons is the best. Decayed leaves are also very favourable to its growth. The situation cannot be too open.

Sow from the end of February to the beginning of April, but the earlier the better. It has been recommended, in field cultivation, to sow them in September; in the garden, when sown at this season, they also obtain a finer size, but many of them run to seed. In the Isle of Guernsey they regulate their time of sowing according to the soil: in the most favourable soils they sow in January, or, if the soil is wet or stiff, they do not insert the seed until the latter end of March.

Sow in drills ten inches apart, and half an inch deep; the compartment being laid out in beds not more than four feet wide, for the convenience of weeding, etc. When the seedlings are two or three inches high, thin to ten inches apart, and remove the weeds both by hand and small hoeing. The beds require to be frequently looked over, to remove all seedlings that may spring up afresh, as well as to be frequently hoed until the plants so cover the ground as to render it impracticable.

The roots may be taken up as wanted in September, but they do not attain maturity till October, which is intimated by the decay of the leaves.

In November, part of the crop may be taken up, and, the tops being cut close off, laid in alternate layers with sand, for use in frosty weather. The remainder may be left in the ground, and taken up as required, as they are never injured by the most intense frost, but, on the

contrary, are rendered sweeter. In February or March, however, any remaining out must be taken up, otherwise they will vegetate. Being preserved in sand, they continue good until the end of April or May.

To obtain Seed.—Some of the finest roots are best allowed to remain where grown; or else, being taken up in February, planted in a situation open, but sheltered from violent winds. If of necessity some of those are employed which have been preserved in sand, such should be selected as have not had their tops cut off very close.

In dry weather water plentifully twice a week. At the end of August the seed is usually ripe; the umbels may then be cut, and when thoroughly dried on cloths, the seed beaten out and stored.

Seed should never be employed that is more than a twelvemonth old.

Parsnip Fly. *Tephritis otophaga*. See **Celery Fly**. The parsnip seeds are also attacked by *Depressaria heracliana*, a greyish moth about an inch across.

Diseases.—Minute fungi, such as *Erysiphe Martii* and *Peronospora nivea*, occasionally attack parsnips, but do little damage.

Parso'nsia. (In honour of *Dr. J. Parsons*, a microscopist. Nat. ord., *Apocynaceae*; Tribe, *Echitideae*.)

Greenhouse climbing shrubs. Cuttings of firm side shoots in summer under a bell-glass. Light loam.

P. albiflora. Cream-colour. May. New Zealand-Syn., *P. heterophylla*. Paxt. Fl. Gard. i. p. 91, fig. 62.

—*varia* *bitis*. Perhaps a young state of *P. albiflora*.

—*velutina*. N. Holland.

Parterre is synonymous with our English name *Flower Garden*.

Parthenium. (From *parthenos*, a virgin; a name given to a plant by Hippocrates. Nat. ord., *Compositae*.)

Greenhouse, or half-hardy annual. Common soil. Seeds.

P. Hystero'phorus. Whitish. West Indies. B. M. t. 2275. Bastard Feverfew. West Indian Mugwort.

Parting the roots is a mode of propagation available with some plants; and where a large increase of an individual specimen by this mode is desired, its flower-stems should be removed as fast as they are produced. This makes the plant stool, for whatever prevents the formation of seed, promotes the development of root.

Partridge Berry. *Gaultheria procumbens* and *Mitche'lla repens*.

Partridge Pea. *Hicist'ria*.

Pasca'lia. (Named after *Dr. Pascal*, professor at Parma. Nat. ord., *Compositæ*; Tribe, *Helianthoidæ*.)

Half-hardy herbaceous. Division in spring; cuttings under a hand-light, in summer; should have a dry, warm spot, or the protection of a frame, in winter.

P. glau'ca. 1½. Yellow. July. Chili. 1799. Andr. Rep. t. 549. Possibly a species of *Helianthus*.

Pasi'thea. (After the nymph, *Pasithea*. Nat. ord., *Liliacæ*; Tribe, *Asphodeleæ*.)

P. cæru'lea. Blue. May. Chili. Syn., *Anthericum cæruleum*.

Pasque Flower. *Anemone Pulsatilla*.

Passeri'na. Sparrowwort. (From *passer*, a sparrow; referring to the beaked seeds. Nat. ord., *Thymelacæ*; Tribe, *Euthymelææ*. Allied to Dais.)

Greenhouse evergreens, white-flowered, and from the Cape of Good Hope, except where otherwise mentioned. Cuttings of the young shoots, half-ripe, in sand, under a glass, in April or May; sandy peat, with a few nodules of fibry loam. Winter temp., 40° to 48°; summer, a rather shady place after the wood is ripe. *P. filifor'mis* might be tried against a conservatory wall.

P. cilia'ta. 2. May. 1818.
— *empetrifolia*. 2. Yellow. July. Spain. 1834.
— *ericoides*. 3. May. 1810. Syn., *Lachnæa conglomerata*.

— *filifor'mis*. 1. July. 1752.
— *grandiflora*. 1. May. 1789. B. M. t. 292.
— *hirsuta*. 1½. South Europe. 1759. B. M. t. 1949.

— *la'za*. ¾. June. 1804. B. C. t. 755.
— *linearifolia*. 3. May. 1820.
— *rigida*. 2. May. 1817.
— *spicata*. 1. May. 1787. B. C. t. 311.

— *Stelle'ri*. June. Siberia. 1817.
— *teniflora*. ¾. July.
— *Thunbergii*. 3. May. 1817.
— *uniflora*. ¾. May. 1759.

EXCLUDED SPECIES.

P. Tarton-ra'ira. See *Daphne Tarton-raira*.
— *thymelæa*. See *Daphne thymelæa*.
— *villo'sa*. See *Daphne tomentosa*.

Passiflora. Passion-Flower. (From *passio*, suffering, and *flos*, a flower; referring to the filaments, or rays, and other parts, being likened to the circumstances of Christ's crucifixion. Nat. ord., *Passifloracæ*; Tribe, *Passiflorææ*.)

Cuttings of young wood, in almost any stage during summer, in sand, under a bell-glass or hand-light; peat and loam. *Cæru'lea* and its varieties are the hardest. It not only flowers freely, but ripens fruit against a wall round London. *Incarnata* is a pretty thing, of semi-herbaceous habit, which has also, in a few cases, been tried against a wall. The shoots of the *cæru'lea* group might easily be wrapped together, and protected in winter by a mat. The fruit of many is very pleasant and refreshing to most palates. *P. edulis* fruits very freely in a stove, but the flower has no great beauty; it fruited a number of years with us in a cool conservatory, but it died at last. We found it hardier than the *P. Billotii*. The *quadran-*

gularis, to be fruited, must be grown in a good, light situation, in a warm stove, and be artificially impregnated. See GRANADILLA.

HALF-HARDY CLIMBERS.

P. cæru'lea. 30. White, blue. August. Brazil. 1699. B. M. t. 28. There are several hybrids from this species.
— *Colvi'lei*. White, blue, purple. Swt. Fl. Gard. t. 125.
— *glaucoephylla*. 20. Blue. August. Brazil.
— *incarnata*. 30. Pink. June. S. Amer. 1629. B. M. t. 3697.

STOVE CLIMBERS.

Passion Flower. *Passiflora* and *Tacsonia*.

Pastina'ca. Parsnip. (From *pastinum*, a dibble; referring to the shape of

the root. Nat. ord., *Umbelliferae*.) A synonym of **Peucedanum**.

P. Opo'ponax. See *Malabaila Opoponax*.

— *sativum*. Eng. Bot. ed. 3, t. 612. See *Peucedanum sativum*.

Patago'nula. (From *Patagonia*, its native country. Nat. ord., *Boraginæ*; Tribe, *Cordiææ*.)

Stove evergreen tree. Cuttings in sand, under a glass, in May; sandy loam and fibry peat. Winter temp., 50° to 55°; summer, 60° to 85°.

P. americana. 20. White. July. Brazil. 1732.

Patero'nia. (Named after *Col. W. Paterson*, a botanist. Nat. ord., *Iridææ*; Tribe, *Sisyrinchieæ*. Allied to *Sisyrinchium*.)

Greenhouse herbaceous perennials, from New South Wales, and blue-flowered, except where otherwise mentioned. For culture, see IRIS.

P. glabrata. 1½. Purple. June. 1814. B. R. t. 51.

— *glauca*. 1. June. 1820. B. M. t. 2677.

— *lanata*. 1. June. 1824.

— *longifolia*. 1. June. 1818.

— *longica'pa*. 1½. June.

— *me'dia*. A synonym of *P. glabrata*.

— *occidentalis*. 1. June. 1824.

— *pygma'ea*. May.

— *sapphiri'na*. B. R. 1839, t. 60. A synonym of

P. occidentalis.

— *sericea*. 1½. June. 1803. B. M. t. 1041.

Patience, Herb. *Ru'mex Patie'ntia*.

Patri'nia. (Named after *M. Patrin*, a Siberian traveller. Nat. ord., *Valerianaceæ*.)

Hardy biennials, except *heterophylla*, and all yellow-flowered. Seed in March, in light soil.

P. heterophylla. May. China. 1837. Hardy herbaceous. Syn., *Valeriana siberica*. B. M. t. 714.

— *interme'dia*. 1. June. Siberia. 1820. Syn., *P. nudiuscula*.

— *rupes'tris*. 1. May. Siberia. 1801.

— *scabrofolia*. 1. June. Dahuria. 1817.

B. C. t. 1340. Syn., *P. serratifolia*.

— *sibirica*. 1. June. Siberia. 1751. Syns.,

P. coronata, and *Valeriana ruthenica*.

B. M. t. 2325.

Paulli'nia. (Named after *S. Paullii*, a Danish botanist. Nat. ord., *Sapindaceæ*; Tribe, *Sapindeæ*. Allied to *Sapindus*.)

Stove evergreen, white-flowered twiners. Cuttings of ripe shoots in sand, under a bell-glass, and in bottom-heat; loam and leaf-mould. Winter temp., 60°; summer, 60° to 85°.

P. asiatica. See *Toddalia aculeata*.

— *bipinnata*. 20. Brazil. 1816.

— *carthaginensis*. A species of *Serjania*.

— *cauliflora*. 18. Caraccas. 1822. Jacq. Ic.

t. 458.

— *Cupa'nia*. 20. Trinidad. 1818.

lensis.

— *pubescens*. 16. S. Amer. 1820.

— *senegalensis*. See *P. pinnata*.

— *tetragona*. 20. Cayenne. 1825.

P. thalictrifolia. Pinkish. Brazil. 1871. B.

M. t. 5879. A very beautiful climber.

— *vespertilio*. 20. St. Christopher. 1823.

Paulowilhel'mia. (Derivation not given. Nat. ord., *Acanthaceæ*.)

Stove herbaceous shrub.

P. speciosa. 2. Mauve-blue, yellow. Tropical

Africa. G. C. 1889, vi. p. 749, fig. 106.

Paulo'wnia. (Named after the hereditary princess of the Netherlands, daughter of the Emperor of Russia. Nat. ord., *Scrophulariaceæ*; Tribe, *Che-loneæ*.)

Cuttings of young shoots, when a little firm, under a hand-light. It is a deciduous tree, with beautiful foliage, and quick growing, somewhat resembling a Catalpa, and said to be hardy, and has not only stood the winter, but flowered in England, though with us it has been killed nearly to the ground every season; deep, good loam; might stand better if starved in summer.

P. tomentosa. 30. Lilac. June. Japan.

1840. Syn., *P. imperialis*. B. M.

t. 4666.

Pave'tta. (The East Indian name. Nat. ord., *Rubiaceæ*; Tribe, *Ixoreæ*. Allied to *Ixora*.)

Stove, white-flowered evergreens. Cuttings of half-ripened shoots in sand, under a bell-glass, in spring; sandy loam and fibry peat. Winter temp., 45° to 48°; summer, 60° to 75°.

P. alba. See *P. indica*.

— *arensis*. 3. June. China. 1799.

R. t. 198. Syns., *P. alba* and *P. tomen-*

tosa.

— *javanica*. A synonym of *Ixora javanica*.

— *natale'nsis*. White. Natal. 1838.

— *tomentosa*. See *P. indica*.

Pa'via. (Named after *P. Paw*, a Dutch botanist. Nat. ord., *Sapindaceæ*; Tribe, *Sapindeæ*.)

In the Genera Plantarum this genus is united with *ÆSCULUS*, from which it differs in having a smooth, not spiny, capsule. Hardy deciduous trees and shrubs, very like the Horse Chestnut. Seeds, layers, and grafting on the Horse Chestnut. The weeping one and others look interesting when grafted at a good height; deep, sandy loam.

P. alba. 8. White. April. N. Amer. 1820.

Syns., *P. macrostachya*, *Æsculus macro-*

stachya, B. M. t. 2118 and *Æ. parvi-*

flora.

— *californica*. 30. White. California. 1838.

— *car'nea*. 16. Red. 1820. Swt. Fl. Gard.

ser. 2, t. 301. Syn., *Æsculus carnea*.

— *discolor*. 4. Red, yellow. June. N. Amer.

1812. Syn., *Æsculus discolor*.

— *flava*. 20. Yellow. May. N. Amer. 1764.

Syn., *Æsculus flava*.

— *indica*. North of India. 1844. Syn., *Æsculus*

indica.

— *macrocar'pa*. See *P. alba*.

— *macrostachya*. 6. White. June. N. Amer.

1820. G. C. 1877, p. 657. Syn., *Æ. mac-*

rostachya.

— *neglecta*. 20. Pale yellow. May. 1823.

Syn., *Æsculus neglecta*.

- P. rubra*. 6. Scarlet. May. N. Amer. 1711.
Syn., *Æscutius Pavia*.
— *arguta*. 4. Red. Europe. 1820.

P. rosea. B. R. 1836, t. 60. See *Spathoglottis rosea*.

Pea. (*Pisum sativum*.) There are many varieties, but a great sameness about those of the early kinds. One good variety is all that is required in a small garden; and for one combining all the good qualities of a pea, *Alpha*, 3 feet high, is among the best. *American Wonder*, *Dr. Hogg*, *Ringleader*, *William the First*, etc., are also all good, well-known peas, where variety is required. The best varieties to succeed are the *Champion of England*, a first-rate pea, 4 to 5 feet high; *Dickson's Favourite*, *Fill Basket*, *Marvel*, *Telegraph*, *Vetch's Perfection*, etc., all of which are first-rate peas to succeed each other from May till November. There are many other good varieties, such as *King of the Marrows*, *Macleans Best of All*, *Prizetaker Green Marrow*, *Telephone*, etc., etc.

One quart of an early variety of pea is quite sufficient for sowing a row 100 feet in length; half a pint less sown in the same distance of the blue varieties, and one pint of the large and tall kinds, are sufficient where the soil is rich, well pulverized, and pretty free from slugs, etc.

Soil.—A soil moderately rich and open is best, rather inclining to strong for the lofty growers and main crops, but for the early and late ones, light and dry.

Dwarf varieties will grow on poorer and lighter soils than the others.

Early Peas.—The best mode of obtaining these is according to the following plan, suggested by Mr. Bishop, gardener to C. Baldwin, Esq., of Camberwell:

In the last week of January, cut some turf in strips of three inches in width, the length depending on the width of the hotbed in which they are to be placed. Lay the pieces of turf in the frame, grass downwards, close together; then make in the centre of each piece of turf, by pressing it with the edge of a board, a drill, in which sow the peas, which soon come up; and then take the lights entirely off in the day-time unless very cold, and shut them down at night. Keep them close till the beginning of March. When the peas are to be planted in the border, lift the box entirely off, and the strips of turf, in which the peas will be well rooted, and place them on a hand-barrow, and take them to the border for planting, which do in a drill cut so deep that they shall be about an inch lower than they were in the box. It may be necessary to protect them from frost and cool winds at first, and this may be done by putting some short sticks along the rows, and laying some long litter or cuttings of evergreens over them.—*Gard. Chron.*

Sowing.—In January they may be sown in sheltered borders, and larger supplies in an open compartment, and thence continued throughout February and until the end of May once every two or three weeks.

For the first production in the following year, a small sowing may be made at the close of October, and repeated about the middle of November and December, though it often happens that these are scarcely a week forwarder than those inserted in the following February.

Sow in drills, or by the dibble in rows, at a distance proportionate to the height to which the variety grows, as well as according to the season; Dwarfs at two feet, for the early and late crops, but three feet for the main ones; Marrowfats at three and a half or four and a half; Knight's Marrowfats and other gigantic varieties at six or eight. Peas not intended to be supported require the least room. At the early and late sowings the seed should be buried an inch deep, but for the main crops an inch and a half. With respect to the distances, it may be inserted in the row, of the Dwarfs, two in an inch; Blues and other middle-sized varieties for the main crops,

three in two inches; the tall and Knight's Marrowfat, as well as others of similar stature, full an inch apart. The best mode is to sow in single rows, ranging north and south, and the sticks alternately on each side of the row. If the rows range east and west, put the sticks on the south side.

When the summer sowings are made, if dry weather is prevalent, the seed should be soaked in water for two or three hours previous, and the drills well watered.

When the plants have advanced to a height of two or three inches, they are to be hoed, and earth drawn around their stems. This should be done twice or three times gradually as they ascend, previous to the sticks being placed. It should be performed in dry weather; for the winter-standing crops it should be especially attended to, as it protects them greatly from frost.

Sticking is not required until the plants show their tendrils. If, during the time of blossoming or swelling of the fruit, continued drought should occur, water may very beneficially be applied, it being poured between the rows, if they are in pairs, or otherwise in a shallow trench, on one side of each. Watering the leaves is rather injurious. Failures in the rows of the earliest crops may be rectified by transplanting. This is best performed in March: the plants thus removed must be watered until they have taken root, and also shaded if the weather is hot. It is a good practice to nip off the top of the leading shoots of the early and late crops as soon as they are in blossom, as it greatly accelerates the setting and maturity of the fruit. Too much care cannot be taken, when the pods are gathered, not to injure the stems. We know, from lengthened experience, that if the pods are cut off with scissors, the plants produce one-fourth more than when roughly gathered from.

The more regularly the plants are gathered from, the longer they continue in production, as the later pods never attain maturity if the earlier ones are allowed to grow old before they are gathered. In very severe weather, the winter-standing crops require the shelter of litter or other light covering, supported as much as possible from the plants by means of branches; ropes or twisted straw-bands are good for this purpose, to be fixed along each side of the rows with wooden pins driven into the ground. Whichever mode of shelter is adopted, it must be always removed

in mild weather, otherwise the plants will be spindled and rendered weaker.

To obtain Seed, leave some rows that are in production during July, or sow purposely in March. Care must be taken, however, that no two varieties are in blossom near each other at the same time. The plants intended for seed ought never to be gathered from. When in blossom, all plants which do not appear to belong to the variety among which they are growing should be removed. They are fit for harvesting as soon as the pods become brownish and dry. When perfectly free from moisture, they should be beaten out, otherwise, if hot, showery weather occurs, they will open and shed their seed.

Forcing commences in December, in the early part of which month they may be sown in a hotbed to remain, or thick to transplant, during the succeeding month, into others for production. These may be repeated in January, and the transplanting takes place in February. It is also a common practice to sow in a warm border during October, and the plants being cultivated as a natural ground crop, are removed into a hotbed during January.

The hotbed must be moderate, and earthed equally over the depth of six or eight inches with light, fresh mould not particularly rich. The seed must be buried one inch and a half deep. The frame, which is required to be two feet and a half high behind, and one and a half in front, ought to be put on three or four days before the crop is sown, that the steam and heat may abate. Seed may likewise be sown at the above times in pots or pans, and placed round the bins of the stove. At the close of September, also, some peas may be sown in pots, and sunk in the earth of any open compartment; when the frost commences, to be removed into the greenhouse. A border of fresh earth being made in the front of it early in December, the plants are removed into it, in rows two feet asunder, or, still better, in pairs, with ten inches interval, and two feet and a half between each pair. These will come into production about the middle of March.

In every instance, as stated above, the rows should be two feet apart, the seed or plants being set an inch asunder. The plants are ready for moving when an inch or two high. They must be shaded and gently watered until they have taken root. Preserve as much earth about their roots at the time of removal as possible.

Transplanted peas are most productive, and run the least to straw in the forcing frames. Air must be admitted as freely as circumstances permit, the same precautions being necessary as for Cucumbers. Water must be given at first sparingly, otherwise decay or superluxuriance will be occasioned; but when they are in blossom, and during the succeeding stages of growth, it may be applied oftener and more abundantly, as it is necessary for the setting and swelling of the fruit.

The shading during hot days, and covering at night, must also be particularly attended to. From three to five months elapse between the times of sowing and production, according to the fineness of the season, length of the days, etc.

The temperature may be uniformly kept up throughout their growth, having 50° for the minimum at night, and 70° for their maximum by day.

Peach. *Pe'stica vulga'ris.*

Select Varieties in the order of their ripening.—Those in *italics* are good forcing peaches. Acton Scot, Pourpré Hâtive, Grosse Mignonne, Red Magdalen, *Royal George*, *Noblesse*, *Bellegarde*, or Galande, Late Admirable, Walburton Admirable, River's Early York, River's Early, etc.

Propagation: Budding.—This is performed during July. (See **Budding**.) Some persons plant the stock against the wall in its permanent situation, and bud it there; but peaches are principally budded in the nursery. The bud is introduced at about six inches from the ground. It remains dormant until the succeeding spring, when the head of the stock is cut off close above the bud, and the wound pared off particularly neat, in order that the returning sap may heal and skin it over. It is a good practice to apply some white lead, or a similar material, in order to exclude the air and moisture. During this summer the young bud will produce a shoot of some two or three feet in length, and this is headed back in the succeeding spring to about five or six eyes, thus leaving about five or six inches of the base of the shoot. The bud generally produced laterals during the first summer, especially towards the upper end; and the point where these commence branching generally dictates the point to which they are cut back. In the summer following they will produce four or five shoots, which must be carefully trained, and kept totally free from insects, and in

the succeeding autumn the tree is fit for removal to a wall. Plants with one shoot, or of the season next after the budding, are termed by our nurserymen *maidens*; but in the succeeding summer they are termed *trained* trees. There is no better *stock* for general peach-budding than the Plum, a kind called the Muscle being very generally used. Some persons advocate the use of either Almond stocks or Peaches raised from the stone; but it is scarcely safe to recommend the practice. The Americans, to be sure, raise many of their orchards from the stone; but they have a very different climate to deal with, and we hear, moreover, many complaints of the short-lived character of their trees. The peach stones may either be sown in heat to expedite them, or otherwise. They should be cleansed and dried at the ripening period, and may be sown late in the autumn, care being taken to preserve them from the mice. The seedlings must be carefully transplanted like other shrubs; those raised in heat in pots, and those in the open ground to the nursery immediately after one summer's growth, unless sowed to remain. Their pruning must be performed as other stocks, and their subsequent culture similar.

Soils, etc.—The selection of a proper soil, and the securing a sound and dry subsoil, are of as much importance with the peach as with the vine. Three-fourths of the trees in this kingdom have been ruined by borders too deep, too damp, and too rich. Unless proper means be taken to ripen the wood, all other labours are vain. The first step in root culture is to examine the subsoil; if this is not sound and dry, it must at once be thoroughly drained. As to depth of soil, we do not exceed two feet, and nobody has had greater success for many years. How much, however, that depth is above the ground level must depend on the character of the locality: if a low and damp district, we would have nearly half the volume of the soil above the front walk; if a very dry and elevated spot, not more than a third. The latitude of the place should also have an influence; and in many parts of Scotland and the north of Ireland we should raise nearly the whole border above the ordinary level. No soil is fitter than a good, sound, hazel loam; but, whatever be the colour, it is absolutely essential that it be of a texture slightly adhesive. We introduce no manure with such a soil, but generally mix with it about one-third of

ordinary dark, light garden-soil, adding about one-sixth of ordinary tree or shrub leaves with the whole. We generally make an artificial subsoil, planting on what we term "prepared stations." The site being drained, and the excavations formed, brick-bats, or any imperishable rubbish, is strewed over the bottom, and then covered with cinders; the latter have a couple of barrows of half-decayed leaves spread over them. This comprises the whole of our preparations. As for manures, we top-dress systematically every year in May: this forms an essential accompaniment of the shallow border system.

Culture during the Growing Period.—Protection to the blossoms is the first thing in early spring. (See **Protection**.) The next point is disbudding. Healthy trees are sure to produce a host of little shoots, which must not be retained. Disbudding is best performed by degrees, and about three periods two or three weeks apart suffice. At the first, which should be when the young shoots are from two to three inches in length, those shoots only need be removed which project nearly at right angles from the wall; as, also, those which shoot between the wall and the branch. Nothing can justify the reservation of any of these but bare spaces of walling; such should be covered, ven if by shoots of inferior character. At the second disbudding a sort of "singling out" may be practised. At the third thinning a clever selection should be made, and in doing so we should direct especial attention to the preservation of the lowest-placed young shoots all over the tree, for on these mainly depends the supply of successional wood. By the fan mode of training, which is at least equal to any other mode, acute angles, of course, are formed by every two branches when they meet. The lowest shoot in this angle, then, must be carefully preserved, and if overtopping the next shoot a-head, it may at once be pinched. Our practice is to turn next to all the extreme points, and to set the leading shoot free. It is of no use suffering any side-shoots to compete with the leading ones; therefore, all within four or five inches may be stripped away, or, if doubtful, pinched. And now a regular thinning or disbudding must be carried out between the bole and the extremities of the branches; and the only requisite is not to suffer, if possible, two young shoots to proceed side by side from any given point. Thus, training from any young shoot at the base, we would not reserve

another nearer than four or five inches up any given line, and so on, all over the tree. One thing may be observed; if the operator is at any time doubtful about a young shoot, let him merely pinch the point instead of totally removing it; at the finishing disbudding he will perceive whether it may be entirely stripped away. Disbudding should be completed a little before Midsummer. During this period the fruit must be thinned, if too thick, and this may be done at three different periods; the first, when the fruit is as large as a marble, when all malformations, and those crowded behind the shoots, may be taken away. The remaining, if too thick, must be singled out, leaving none in pairs or touching each other. At this period, they may average three inches apart all over the tree. In about three weeks, another slight thinning may be made, taking away a few where crowded; and now the remainder may be reserved until the stoning is nearly completed, which will be in the course of July, when all not wanted may be plucked away. It is difficult to give any set rule as to distance, so much depends on the powers of the trees; from six to eight inches apart, finally, may be considered a fair crop. Water should be liberally supplied during their swelling, if the weather is dry. All gross shoots, or robbers, should be pinched when about six inches in length, throughout all the growing season.

Culture during the Rest Period.—Do not brush off the foliage of peaches in the autumn; the practice is not only unscientific, but really absurd. If the summer's management has been right, the pruning will be but a small affair. It consists of thinning out the shoots which had escaped notice in summer, and shortening back as much of the point of each shoot as appears immature: this is readily told by its colour and general character. These things done, the trees must be neatly trained, and such should be completed by the beginning of February, about which time we cover ours to retard the blossom-bud. Before covering them we apply a sulphur-paint, as a preventive of the red spider. This is simply sulphur beat up in soap-water, four ounces of soft soap to a gallon, adding nearly as much sulphur as it will carry, and plenty of clay to give it a body. This is applied in all directions, between the shoots, with a painter's brush. In order to soften the colour, it is well to add plenty of soot to the mixture.

Diseases.—The *Gum* is the principal ; and as a gumming habit is readily induced by wounds, especially if the tree be growing in a deep and rich soil, great care must be exercised at all times not to wound them. Rich soils, also, must be avoided, and manurial matters applied, for the most part, on the surface. The *Mildew* is a great annoyance to some cultivators. Sulphur is the best remedy, and an avoidance of extremes of wet and dry at the root the best preventive. *Blistered leaves* are said to be caused by cold at the germinating period ; but this we much doubt. It probably arises from imperfect ripening of the wood in the preceding season, caused by ungenial soil and ill-training ; indeed, it would not be difficult to trace three-fourths of the evils to which the peach is liable to ill-conditioned wood.

Insects.—See **Aphis** and **Acarus**.

Forcing: Form of House.—The best form for a peach-house is that thus described by the late T. E. Knight, Esq. :

As the lights, to be moved to the required extent with facility, must necessarily be short, the back wall of the house must scarcely extend nine feet in height, and this height raises the rafters sufficiently high to permit the tallest person to walk with perfect convenience under them. The lights are divided in the middle at the point A, and the lower are made to slide down to the D, and the upper to the point A. The flue, or hot-water pipe, enters on the east or west end as most convenient, and passes within six inches of the east and west wall, but not within less than two feet of the low front wall, and it returns in a parallel line through the middle of the house, in the direction either east or west, and goes out at the point at which it entered. The house takes two rows of peach or nectarine trees, one of which is trained on trellises, with intervals between for the gardener to pass, parallel with the dotted line C. These trees must be planted between the flue and the front wall, and the other row

near the back wall, against which they are to be trained.

If early varieties be planted in the front, and the earliest where the flue first enters, these being trained immediately over the flue, and at a small distance above it, will ripen first ; and if the lower lights be drawn down in fine weather to the point B, every part of the fruit on the trees, which are trained nearly horizontally along the dotted line C, will receive the full influence of the sun. The upper lights must be moved as usual by cords and pulleys, and if these be let down to the point A, after the fruit in the front tree is gathered, every part of the trees on the back wall will be fully exposed to the sun, at any period of the spring and summer after the middle of April, without the intervention of the glass. A single fireplace will be sufficient for a house fifty feet long, and the foregoing plan and dimensions will be found to combine more advantages than can ever be obtained in a higher or wider house. Both the walls and the flue must stand on arches, to permit the roots of the trees to extend themselves in every direction beyond the limits of the walls, for whatever be the more remote causes of mildew, the immediate cause generally appears to be want of moisture beneath the soil, combined with excess of moisture or dampness above it. A bar of wood must extend from B to D, opposite the middle of each lower light, to support it when drawn down.—*Knight's Select Papers.*

The soil, culture, and pruning are the same as required for those trees grown on walls.

Forcing in Pots is a very excellent mode, and enables the peach to be thus grown in establishments where there is no regular peach-house. Pot a three-years-old tree in a twelve-inch pot, cutting it back to four buds, and shift every year until it has attained an eighteen-inch pot, a size which need never be exceeded. Let the soil be turfy, and mixed with decaying wood from the bottom of an old wood stock.

Commencing Forcing and Temperature.—The best and most successful directions on these points are the following, given by Mr. W. Hutchinson, gardener at Eatington Park. He says : "Bring the trees into the house in mild weather during November, a little earlier or later, according to the state of the weather ; do not start them all, however, at once ; the last lot need not be put in until the 1st of January. Any

later than this would not answer, as the weather, if clear, is then hot through the day; commence forcing them at 55° at night, allowing the thermometer to fall to 50° in the morning, if cold; but if the weather is mild, never to fall below 55°, and from that to 60°, is the usual temperature kept up throughout the period of forcing during the night. During the day I make up for low night temperature, when I have the chance, by sun heat. Do not be fastidious about a few degrees: to get it high enough is the main point, say from 70° to 85° and 90°, until the fruit is stoned; then keep them very hot during the day, viz., from 95° to 105°, and sometimes even as high as 110°. Of course a great deal of moisture is required with this high temperature. Syringe overhead twice a day, and sometimes oftener when the air is dry, and you will scarcely ever be troubled with either green fly or red spider. Watering at the root must be carefully attended to; very little is wanted until the trees get covered with leaves, but after the fruit is stoned they should be watered plentifully. Of course the watering must be gradually withdrawn as the fruit approaches maturity, in order to increase their flavour."—*Gard. Chron.*

When the blossoms are well opened, impregnation should be aided by applying the pollen with a camel's-hair pencil.

One essential for securing vigorous production in the peach-house is to have the roots of the trees well nourished. If these are not duly supplied with moisture and food during the time the fruit is setting and swelling, a failure of the crop is inevitable. To secure such a supply, it is a most effectual treatment to give the border a top-dressing, at the close of February, of charred turf. Liquid-manure and water, of course, must be given also, as the dryness of the soil and appearance of the trees indicate is necessary.

Standards.—In Essex we have grown the peach successfully, both as a standard and as an espalier, in a garden sloping to the south, and well protected from the east and strong westerly winds.

Peach Blister. Many conflicting accounts have been given as to the cause of this disease, but it now seems clearly established that, like many other diseases of plants, it is caused by the corroding mycelium of a fungus, in this case by *Ascomyces deformans*. The disease takes the form of large red irre-

gular blisters upon the leaf (Fig. 1, reduced), sometimes without any fungus being apparent to the naked eye, or, as seen under an ordinary lens, at other times the fungus is visible as a very fine whitish surface covering a portion of the blister; this is because the fungus grows among the cells in the interior of the blister, only coming to the surface when perfecting its fruit. Fig. 2 shows a thin

section through a portion of a blister with the fungus in fruit, magnified about 100 diameters. The spores are formed in little sacs, called *asci* (*a*), each ascus containing 8 spores; when ripe, the asci burst, and the spores escape, ultimately to reproduce the fungus. The spores contain one, two, or three nuclei, as shown at Fig. 3, magnified about 600 diameters. We did not observe any spores containing three nuclei in our specimen, but give them on the authority of Mr. W. G. Smith, who published an account of the fungus in the "*Gardener's Chronicle*" for 1875, vol. 4, p. 136. Mingled with the asci are some beaded threads (*b*), which probably break up and form a second kind of fruit.

Pear. *Pyrus communis*.

Superior Dessert kinds, arranged in the order of ripening.—1, Citron des Carnes; 2, Jargonelle; 3, Délice d'Hardenpont; 4, Dunmore; 5, Marie Louise; 6, Louis Bonne of Jersey; 7, Fondante d'Automne; 8, Beurré d'Amalix; 9, Beurré Diel; 10, Althorpe Crasanne; 11, Winter Nelis; 12, Passe Colmar; 13, Hacon's Incomparable; 14, Thompson's; 15, Knight's Monarch; 16, Glout Morceau; 17, Beurré d'Arenberg; 18, Easter Beurré; 19, Soldat Laboureur; 20, Josephine de Malines; 21, Ne plus Meuris; 22, Beurré Rance.

Kitchen Pears in the order of their ripening.—1, Bezi d'Heri; 2, Summer

Compote; 3, Catillac; 4, Bellissime d'Hiver; 5, Uvedale's St. Germain.

Useful and profitable Orchard Pears.—1, Beurré de Capiaumont; 2, Beurré Diel; 3, Louis Bonne of Jersey, William's Bon Chrétien; 4, Jargonelle; 5, Swan's-egg; 6, Moorfowl's-egg. Those living north and south of the centre of England must make allowance accordingly.

Of *Dessert Pears*, Nos. 1, 2, 3, 4, 6, 8, 9, 10, 13, 15, 16, 18, will succeed well, if necessary, as espaliers, pyramids, etc.; that is to say, they will do very well without a wall. Of course, the orchard pears may be added to this section, if necessary. Nos. 5, 11, 12, 16, 17, 19, 20, 21, 22, should have a wall, if possible. Nos. 11, 12, 17, 21, deserve a south aspect. The varieties are now very numerous, and a great many of them useless.

Propagation.—Grafting is the usual mode; and for this purpose two distinct kinds of stocks are used—the one called the free stock, or wild seedlings, the other the quince. The first is the most proper for the orchard pear, as this produces much larger trees; the latter is best adapted, in general, for espaliers, walls, and pyramidal trees in gardens.

Budding is done precisely as for other fruits, and for the same purposes as grafting. By this course, however, one year, or nearly so, may be considered as lost, in point of time.

Seed is resorted to, either to produce stocks, or to raise new kinds. The seeds should be washed from the pulp when the fruit is fully ripe, dried and preserved as other seeds, and sown in the February following. Care must be taken to preserve the seed from mice whilst germinating. Those who wish to expedite the process, for the sake of gaining time, with fancy seedlings, may sow and rear the young plants in a moderate bottom-warmth, sowing in January or February, potting off the plants when up, and hardening them off by the beginning of June, when they may be planted out in a warm spot. The best way to prove such seedlings is to graft them on a good bearing old tree, on a quince stock, if possible; they will thus fruit in half the time. Our nurserymen, who rear immense quantities for stocks, bury the pears in a pit in autumn, and take them up in the February following to sow, mixing abundance of sand with the mass, to separate the seeds from the pulp; the whole is then sown together.

Soil.—The pear delights in a sound

loam, rather inclining to clayey than sandy. It will, however, grow freely in sandy loams; but the fruit is very apt to crack, or become otherwise disfigured, through their impatience of drought. Any ordinary soil of a sound texture will do for their culture; and if what is termed "in good heart," no manures are necessary. For standard trees in orchards, the soil should be at least two feet deep; but for espaliers, walls, pyramids, etc., half a yard may suffice, if sound. A dry subsoil is particularly necessary, especially for garden pears.

Culture during the Growing Period.—The chief point is to keep down watery spray, which is generally produced in abundance. Caution must be exercised in not doing this too early, or the embryo blossom-buds may be driven into growth. Our practice is to commence by disbudding; this is generally in the beginning of May. All gross *foreright* shoots are stripped away, and several of the more luxuriant shoots, where too thick. In a few weeks the shoots begin to lengthen considerably, and their character, as to fruitfulness, is in some degree determinable. Very few of our pears bear on wood of the previous year, but a great many shoots plainly show betimes that their tendencies are towards fructification; such should, by all means, be encouraged. About Midsummer, a selection may be made; most of those which look browner than the rest, and are shorter jointed, must be reserved; and much of the paler, longer-jointed, and more succulent-looking spray may be cut or pinched back, leaving about four inches at the base. Those reserved we tie down to the older branches, sometimes in a reverse position—indeed, just as they happen to lay. In about a month or so from this operation we pinch the points from all growing shoots, or nearly so. This is generally done about the middle of August, and has a tendency to cause the wood to become highly solidified, and thus induces fruitfulness. After this period, the only care is to pinch the points of all succulent spray which may arise.

Culture during the Rest Period.—When the summer culture of the pear is properly attended to, but little is left for the winter pruner. Nevertheless, there is still something to do. Some shoots will have escaped the summer dresser, and many "snags" must be cut entirely away. Most of those which had been pinched back to three inches at Midsummer, or after, must be pruned closely off. No stump or spur must be left,

unless a blank space occurs; as these, by what used to be termed spurring back, only produced their like again. These snags removed, the young shoots tied or nailed down must be examined, and all considered superfluous cut away. Those reserved must be tied down on the old stems, or nailed between them, and little more is necessary until the growing period returns.

Storing.—The conditions requisite for keeping pears are a rather cool room, and one that is dry. It is well known, however, that several of our superior pears require a certain amount of warmth when near the period of use, to give them their proper flavour. We, therefore, in advising a somewhat cool room, refer to one of the most important objects connected with the dessert-table—the providing a long and continuous succession. Still it has been generally found, that in proportion as any given kind has been kept past its natural period, it has, in like proportion, lost flavour, as, also, that buttery texture for which a ripe pear is so much esteemed. What is the best temperature is not quite certain; it probably differs somewhat in different kinds. We should say 55° to 60°; not more than the latter; probably, a condition of air similar to a fine, mild, October day.

Diseases.—See **Canker**. They are also liable to decay at the points of the shoots in some soils, which, we think, generally arises from the roots entering improper or cold subsoils.

Insects.—See **Acarus**, **Aspidiotus**, and **Selandria**.

Peda'lium. (From *pedalion*, a rudder; the fruit has rudder-like angles. Nat. ord., *Pedaliaceæ*.)

A sparingly-branched, stove annual. Seeds. Sandy soil.

P. mu'reæ. Yellow. India and Tropical Africa. Wight Ic. t. 1615.

Pedicula'ris. Lousewort. (From

pediculus, a louse; supposed effect on sheep eating it. Nat. ord., *Scrophulariaceæ*; Tribe, *Euphrasiaceæ*. Allied to *Melampyrum*.)

Seeds and cuttings. Loam and peat; the great proportion require the cold pit in winter. *See-primum Carolinum* is a giant among them, and one of the most beautiful. They should be sown where it is intended they are to remain.

Pedila'nthus. (From *pedilon*, a shoe, and *anthos*, a flower; on account of the shape of the flower. Nat. ord., *Euphorbiaceæ*; Tribe, *Euphorbiææ*. Allied to *Euphorbia*.)

Stove perennial shrub, of a succulent nature. Cuttings should be well dried at the base, and allowed to cicatrize before inserting in sand, which should be slightly damped from time to time, but never made very wet. When rooted well, they may be planted in a mixture of two-thirds sandy loam, and one third brick rubbish, to which may be added a little rotten cow-dung. Summer temp., 60° to 80°; winter, 60° to 70°. The atmosphere should be dry.

P. tithymalo'ides. 3. Red. E. Indies. 1874. Sins., *Euphorbia carinata*, B. R. t. 837, and *E. canaliculata*, B. C. t. 727. There are two varieties of this, viz., *variagat'us*

and *variegatus cucullatus*, both with white-bordered leaves, the latter with the edges drawn up so as to appear cupped.

Pe'kea. (Said to be from the Guianese name. Nat. ord., *Ternstroemiaceæ*.) See **Caryocar**.

P. tuberculosa. See *Caryocar tomentosum*.

Pelargo'nium. Stork's-bill. (From *pelargos*, a stork; referring to the beak-like formation of the ripe seed-pod. Nat. ord., *Geraniaceæ*; Tribe, *Geranieæ*.)

Natives of South Africa, except where otherwise mentioned. Many, however, have originated as garden hybrids. Seeds; cuttings. Rich sandy soil.

Pelargonium Culture. — *Progenation by Seed* is the only way to raise new varieties. The first and most important of their qualities is *form*, the next is substance, the next size, and the last colour. To these may be added habit and truss. Save seed only from such as possess already these points approaching to perfection. *In all attempts to hybridize, let the one to bear the seed possess the property of form.* In order to obtain the other properties wanting, cut off the anthers of the well-formed variety before the pollen-cases shed their contents; and the moment the hybridizing is performed, cover the flowers with a close-fitting cap of fine muslin-net, to prevent insects from carrying strange pollen to the stigma dusted with pollen from such varieties as have the desirable properties. When the seed is ripe, gather it carefully, and divest it of its arils, or feather-like appendages, wrap it up in paper, and keep it in a dry drawer, in a cool room, till spring. Sow it early in March, and place it in a gentle heat; a hotbed that has been at work for a few weeks will answer admirably. Sow in wide, shallow pots, well-drained, in a light, rich compost, press the seed down gently, and cover it about a quarter of an inch. If the seed is good, it will quickly germinate, and should then be removed from the hotbed, and placed upon a shelf in the greenhouse near to the glass. Water very moderately, or the plants will be apt to damp off. As soon as the seedlings have made their second leaf, pot them off singly into two-inch pots, in a compost of loam and leaf-mould, in equal parts, with a liberal addition of river-sand, finely sifted. Replace them on the shelf, and shade for a time from hot sunshine. The seedlings will soon fill these small pots with roots. They must then be re-potted into a size larger pot, and subsequently be treated in the same way as such as have been propagated by cuttings. Keep them close to the glass, and give abundance of air on all favourable occasions. As soon as

the weather will permit, place them out of doors, upon a bed of ashes of sufficient thickness to prevent worms from entering the pots. The situation should be an open one, the grand object being to ripen the wood, and induce a stocky or bushy habit, so as to insure their flowering the following season. The size of pots to flower them in need not be more than four and a half inches. When there is a fear of autumnal frosts, remove them into the greenhouse, and place them on a shelf, at such a distance from the glass as will serve to keep them dwarf and bushy. There is no need to top them in the manner recommended hereafter for plants raised from cuttings, the object being not to make fine specimens, but to get them to flower as quickly as possible the spring following.

By Cuttings.—Cuttings may be put in and struck from March to August; the general time, however, is when the plants have done flowering, and require cutting down to make bushy plants for the next season. This generally happens from the end of June to the beginning of August.

The best place to strike the cuttings in is a well-constructed propagating-house; but, as every one has not such a convenience, they may be very successfully propagated in a frame set upon a spent hotbed, first removing the soil, and replacing it upon a thick coat of coal-ashes, to keep out the worms. Upon this coat place another of cocoa-nut fibre, to plunge the cutting-pots. The cocoa-nut fibre serves to absorb the moisture from the soil in the pots and the necessary waterings. The best soil is pure loam, mixed with silver sand. The size of the pots should neither be too large nor too small—five inches wide at the top is the most proper. Some use small pots, and only place one cutting in each. This, where the cuttings are few and the convenience small, will be suitable enough. It has this advantage, also, that the cuttings are, after being rooted, more conveniently re-potted, without in the least injuring the young and tender roots; but where the quantity to be increased is large, the former method of putting several cuttings in five-inch pots will be more convenient, and, with care, equally as successful. Whichever method is adopted, the pots must be well drained with broken potsherds, the larger pieces at the bottom, and smaller at the top. Fill them to the top with the prepared loam, which should be put through a rather coarse sieve to take out the stones, roots of grain, and other extraneous matter.

It should not be pressed down too hard, but made firm enough to hold the cuttings fast. Another point is to use it in a state neither wet nor dry. The side-shoots which have not flowered, and are not more than two inches long, make the best cuttings. These should be cut off close to the stem from whence they spring with a sharp knife. Cut off the bottom leaves close to the stem, leaving only two of the uppermost. Place the cuttings, after they are made, in a shady situation, upon a dry board or slate, to dry up the wound. This will take an hour on a dry day, or two hours on a dull, cloudy one. Then put them in the prepared pots round the edge, inclining the leaves inwards, so that they may not touch the leaves of those in the contiguous pots when they are placed in the frames, or set upon the heated material in the propagating-house. When a pot is filled, give it a gentle watering, and set it on one side to dry up the moisture on the leaves and surface of the soil. Then plunge them in the frame, and shade them carefully and effectually from the sun, or even from the light. Reduce the shade gradually, using it only during bright sunshine. A little air may also be given every day, by tilting up the lights behind, if in a frame. The propagating-house will only require air when the heat is too great, to reduce the temperature to 55° or 60°. The cuttings must be frequently examined, to see if roots are formed; and as soon as they are an inch long, pot them off immediately into the smallest 60-pots, which are generally about two inches diameter. A small addition of well-decomposed leaf-mould may be mixed amongst the loam with advantage. When they are finished potting off, give another gentle watering, and replace them in the frame or propagating-house until fresh roots are formed; renew the shading, but disuse it as soon as it is safe to do so, and then give plenty of air, to prevent them being drawn up and spindly. To cause them to become bushy plants furnished with branches close to the pot, nip off the top bud; the lower side buds will then break and push forth, and these must be again stopped as soon as they have made three leaves. The plants will then be ready to receive a second potting, and should be removed into the open air.

The above remarks and directions, so far as the cuttings are concerned, relate only to the (as they are called) *show* varieties. There is another class of pelargoniums, which are denominated *fancy*

varieties. These are more difficult to increase by cuttings. Place the cuttings in shallow pans, one and a half inch only deep, with a hole in the centre, in the usual loam and sand, placing them on a shelf in the propagating-house, or in the frame, close to the glass. The cuttings are made very short, with a portion of the old wood at the bottom of each. Very little water is given till they callus, when it is given more freely, and then roots make their appearance, when they are immediately potted off, and the usual treatment followed.

By Buds.—Make a shallow pan ready for them, by first putting in a portion of pure loam and sand, then a covering of pure sand alone, give a gentle watering to settle it, and then prepare the buds. Take a shoot of moderate strength, cut off the leaves, but not quite close to the stem, then cut off the two lowest buds, leaving about a quarter of an inch of wood below each bud. After that, split the shoot containing the two buds down the centre. If the two buds are not exactly opposite, but one a little below the other, the upper one must be shortened below the bud to the proper length. The upper cut should be very nearly close to the bud. Make a sufficient number ready at once to fill the pan or pot, and plant them, using a short, blunt stick a degree thicker than the bud-cutting. Insert them so as only to leave the bud just above the sand. Plant them close to, and round the edge of the pan, placing the cut side close against the pot, which will, of course, place the bud side inwards. Then fill up the holes with a little dry sand, and water gently again. Place them either in a propagating-house, a shady part of a stove near the glass roof, or in a frame. Shade from bright sunshine in whatever situation they are placed, and water as required. The buds will soon break and show leaves, shortly to be followed by a shoot.

By Roots.—Some kinds of *Fancy Pelargoniums*, and most of the *Cape species*, are difficult to increase by any of the above methods. In such cases there is left the mode of increase by cuttings of the roots. This is almost certain of success. Take an old plant, shake off carefully all the soil, and cut the roots into short pieces, retaining as many fibres as possible to each. Put each root-cutting singly into as small pots as they can be got into, leaving the top just visible. Place them in the house, or frame, appropriated to propagation; give a gentle watering, and shade effec-

tually. New roots will soon push forth, and then shoots will appear, generally in clusters. When that takes place, reduce the shade, to give colour to the leaves and strength to the shoots. As these advance in growth, thin them gradually, by slipping one or two off at a time, till finally they are reduced to one which is to form the future plant. As soon as this shoot attains the height of two or three inches, nip off the top to cause side-shoots to grow, and so form a neat, bushy plant.

General Culture: the House.—Pelargoniums, like all other large families of plants, require a house to themselves, and one peculiarly adapted to produce fine specimens. The span-roofed form is the best, and for this satisfactory reason—that the plants in such a house grow on all sides alike. The sides of the house should be of glass, the side windows should move up and down, to allow a free circulation of air, and the top lights should also be movable, to let out the upper stratum of heated air. The plants should be placed upon stages near to the glass. These stages ought to be broad enough to allow large specimens to stand clear of each other upon them. The size of the house will depend upon the means of cultivation, and the number intended to be grown. To exhibit collections of ten or twelve in number, three or four times during the season, the house should be at least fifty feet long, and twenty feet wide. This will allow a stage in the centre ten feet wide, walks round it two and a half feet wide, and a platform all round two and a half feet broad. This will leave the stage ten feet wide, and forty feet long, which will be ample space for three rows of twelve plants in each, full-sized and well-grown specimens. On the platforms next the front light smaller-sized plants may be placed, to succeed the others when they become unsightly through the bloom being over.

The only heat wanted is just enough to keep out the frost, and the best mode of obtaining that heat is by hot water circulating in cast-iron pipes. (See **Greenhouse.**)

Compost.—Procure from an old pasture, where the grass is of a fine texture, as much turf, three or four inches thick, as will serve to pot the collection for one year; cast it into the compost-yard, and have it immediately chopped up into small pieces, and, as it is done, lay it up in a long ridge, facing east and west, so that the sun can shine upon each side morning and evening.

The ridge or bank should not exceed two feet high, on a base of three feet wide. The grassy surface and green roots will soon begin to ferment during the process of decomposition, and the gases arising will penetrate to every particle of soil, and moderately enrich it, quite sufficient to grow geraniums. Let it be turned over every three months for a year, and then it will be fit for use. Unless it be very heavy, or of a close texture, it will not require any addition. If too heavy, add sand to render it of an open texture.

Culture of Established Plants.—Cut them down in July, leave them in a cold pit, and in eight or ten days after being cut down, and receiving moisture about the tops rather than among the roots, the pots may receive a fair watering—as much as will reach every good root. When the buds break, gradually give air. When one inch in length or so, take the plants to the potting-bench, shake the soil from the roots, examine and prune the roots a little, re-shift into similar, or, what in general will answer better, smaller-sized pots; place them again in the cold pit, and keep close until the fresh roots are running in the new soil; then give air gradually, until at length you expose them *entirely* to the atmosphere, steering clear, however, of cold rains and anything like frost. Plants cut down in June and July, if transferred to small pots, will require to be placed in blooming-pots in the end of October. Those cut down in the end of July, or during August, will not want re-potting until the new year has brought lengthened sunshine; and from these different successions of bloom may be expected. To have it fine, cleanliness, air, light, room, and a temperature seldom below 45°, must be leading considerations. Through the winter, unless during sunshine, the temperature should never be higher. After a sunny day it may be from five to eight degrees lower at night with impunity. In the case of large plants, little stopping will be required after re-potting. Thinning instead will often be necessary. Hence old plants generally produce the earliest bloom, as every general stopping of the shoots, as well as every shift given, retards the blooming period.

Pelecyphora. (From *pelekyphorus*, hatchet-bearing; in allusion to some fancied resemblance of the tubercles to a hatchet. Nat. ord., *Cactaceæ*; Tribe, *Echinocactæ*. Allied to *Mammillaria*.)

Greenhouse succulent perennial. For cultivation, see under CACTUS.

- P. aselliformis*. †. White, rose. June. Mexico. 1843. III. Hort. 1858, p. 186.
- *co-necolor*. †. Purple. June. Mexico. 1873. B. M. t. 6061.

Pelexia. (From *peleza*, a helmet; in reference to the shape of the back sepal. Nat. ord., *Orchidææ*; Tribe, *Neottiaæ-Spirantheæ*.)

Stove terrestrial orchid, allied to GOODYERA, to which refer for cultivation.

- P. olivacea*. Olive-green; lip white. Andes. 1891.
- *setacea*. 1-2. Greenish. West Indies. 1834. Syns., *Collea calcarata*, *Neottia calcarata*. B. M. t. 3403, and *Stenarrhynchus calcaratum*.
- *spiranthoides*. 1-3. Greenish, white. West Indies. 1823. B. R. t. 985.
- *triloba*. Green. Brazil. 1870.

Pelican Flower. *Aristolochia grandiflora*.

Peliosanthus. (From *pelios*, livid, and *anthos*, flower. Nat. ord., *Hæmodoraceæ*; Syn., *Teta*.)

Stove perennial herbs, with creeping rhizomes. Propagated by suckers.

- P. alvida*. White. Summer. Malay Peninsula. 1885. B. M. t. 7110.
- *humilis*. 1. Greenish. May. Eastern Himalayas. 1809. B. M. t. 1532.
- *Teta*. 1. Greenish. April. Eastern Himalayas. 1807. B. M. t. 1302.

Pellæa. (From *pellos*, dark-coloured; referring to the stripes. Nat. ord., *Filices—Polypodiaceæ*.)

Stove and greenhouse. See FERNS.

STOVE.

- P. Bridgésii*. See *Platyloma*.
- *cordata*. Tropical America. 1820.

- *Wrightiana*. Mexico. 1865. Nearly hardy.

Pellionia. (Named after A. M. J. Alphonse Pellion, an officer in Freycinet's voyage round the world. Nat. ord., *Urticaceæ*; Tribe, *Urticeæ*. Allied to *Pilea*.)

Stove perennial creeping herb with ornamental foliage. Seeds, divisions, or cuttings. Rich sandy loam. Moist atmosphere. Summer temp., 60° to 85°; winter, 58° to 70°.

- P. Davaudana*. †. Green. Cochin China. 1830. III. Hort. t. 472. Syn., *Begonia Davauana*.
- *viridis*. Leaves bright green, with whitish blotches. 1832.
- *pulehra*. Leaves green, with blackish veins. Cochin China. 1852. III. Hort. t. 479.

Pellitory. *Parietaria officinalis*.

Pellitory of Spain. *A'nthemis Pyrethrum*.

Peltaandra. Arrow Arum. (From *pelte*, a shield, and *aner*, a male; re-

ferring to the shape of the stamens. Nat. ord., *Aroideæ*.)

Hardy perennial. Marsh herb.

P. virginica. 1. June. N. E. America. 1759.

Pelta'ria. (From *pelte*, a little shield; referring to the shape of the seed-pod. Nat. ord., *Cruciferae*; Tribe, *Isatideæ*.)

Hardy, herbaceous perennials. Seeds; divisions. Common soil.

P. allia'cea. 1. White. June. Austria. 1601.
— *glastifolia*. 1. White. June. Syria. 1823.

Pelto'phorum. (From *pelte*, a small shield, and *phoreo*, to bear; alluding to the shape of the stigma. Nat. ord., *Leguminosæ*; Tribe, *Eucæsalpineæ*.)

Stove trees. For cultivation, see ACACIA, stove species. One of the species yields the orange-coloured Braziletta wood.

P. Linna'i. 20. Yellow. Jamaica.

Peltostig'ma. (From *pelte*, a small shield, and *stigma*, a stigma; in allusion to the swollen stigma. Nat. ord., *Rutaceæ*; Syn., *Pachystigma*.)

Stove evergreen shrub. Cuttings under a bell glass in heat. Sandy loam and fibry peat.

P. pteleoides. 10. Green. February. Jamaica. 1844. Syn., *Pachystigma pteleoides*.

Penæ'a. (Named after *P. Pena*, a German botanist. Nat. ord., *Penæaceæ*.)

Greenhouse evergreens, from South Africa, and red-flowered, except where otherwise mentioned. Cuttings of stubby side-shoots in summer, in sand, under a bell-glass; sandy peat and a little charcoal. Winter temp., 40° to 45°.

P. fruticulosa. See *Stylopteris fruticulosa*.

P. villosum. White. Abyssinia. Le Jard. 1891, p. 213.

Penny Grass. *Rhina'nthus cri'stagalli*.

Penny-royal. *Me'ntha Pule'gium*.

Penny-wort, or Penny-leaf. *Cotyle'don Umbi'licus*, *Hydroco'tyle vulgaris*, *Lina'ria Cymbala'ria*, *Sibitho'ropia europæa*.

Penstemon. See **Pentstemon**.

Pentachæ'ta. (From *pente*, five, and *chaita*, a bristle; the pappus has five bristles at its base. Nat. ord., *Compositæ*; Tribe, *Asteroideæ*.)

Hardy herb. Sandy loam in a sunny spot. Seeds.

P. aurea. ½. Yellow. California. 1883. Gf. t. 1153.

Pentade'sma. (From *pente*, five, and *desma*, a bundle; referring to the disposition of the stamens. Nat. ord., *Guttiferae*; Tribe, *Moronobææ*. Allied to *Garcinia*.)

Stove evergreen tree. Cuttings of ripe shoots in sand, under a bell-glass, and in bottom-heat; fibry loam and sandy peat. Winter temp., 60°; summer, 60° to 90°.

P. butyrea'cea. 30. November. Sierra Leone. 1822.

Pentago'nia. (From *pente*, five, and *gonia*, an angle; in allusion to the divisions of corolla. Nat. ord., *Rubiaceæ*; Tribe, *Catesbæææ*.)

Stove shrub. For cultivation, see CINCHONA.
P. Wendlandi. Yellow. Central America. 1861. The foliage very fine. B. M. t. 5230.

Pentalo'phus. (From *pente*, five, and *lophos*, a crest. Nat. ord., *Boraginææ*.)

Hardy, herbaceous perennial. Seeds or divisions; common soil.

P. longiflorus. ½. Yellow. June. Missouri. 1812. Syn., *Batschia longiflora*.

Penta'pera. (From *pente*, five, and *pera*, a bag; in allusion to the five-celled ovary. Nat. ord., *Ericaceæ*; Tribe, *Ericææ*. Closely allied to *Erica*.)

Half-hardy evergreen shrub. Sandy loam and peat.

P. sicula. 1-2. Pink. Sicily. B. M. t. 7030. Syn., *Erica sicula*.

Penta'petes. (From *pente*, five, and *petalon*, a petal; five petals in the flower. Nat. ord., *Sterculiaceæ*; Tribe, *Dombeyææ*. Allied to *Dombeya*.)

Stove, scarlet-flowered plants, flowering in July. Cuttings of half-ripened shoots in sand, under a glass, in moist heat; also by seeds in a hotbed, in spring; sandy loam and leaf-mould. Stove temperature.

P. Erythronylon. B. M. t. 1000. See *Trochetia grandiflora*.

— *ovata*. 2. New Spain. 1805.

— *phœnicea*. 2. India. 1690.

Pentapterygium. (From *pente*, five, and *pterygion*, a small wing; alluding to the winged calyx. Nat. ord., *Vacciniaceæ*; Tribe, *Thibaudieæ*.)

Greenhouse evergreen shrubs. Cuttings in sand under a bell-glass. Sandy loam and peat. *P. florum*. Yellow. Bootan. B. M. t. 4910. — *rugosum*. White, red, green. May. Bootan. B. M. t. 5198. — *serpens*. Scarlet. May. Eastern Himalayas. B. M. t. 6777. Epiphytic.

Pentara'phia. (From *pente*, five, and *raphis*, a needle; alluding to the form of the open calyx. Nat. ord., *Gesneraceæ*; Tribe, *Gesnerææ*.)

Warm greenhouse plants. For cultivation, see *GESNERA*.

P. calycosa. 1½. Red, white. Jamaica. 1824. Syn., *Conradia calycosa*. Ic. Pl. t. 689-690. — *cubensis*. 2. Scarlet. July. Cuba. 1854. Rev. Hort. 1847, p. 361. — *floribunda*. Red. Summer. Cuba. 1878. — *libanensis*. ½. Crimson. June. Jamaica. 1847. Syn., *Gesnera libanensis*. B. M. t. 4380, and *Rhytidophyllum floribundum*. Fl. Ser. t. 178. — *longiflora*. See *Conradia longiflora*. — *neglecta*. ½. Scarlet. September. Jamaica. 1847. — *verrucosa*. Scarlet. May. Cuba. Paxt. Fl. Gard. iii. p. 30, fig. 250.

Pentas. (From *pente*, five; referring to the number of petals and stamens. Nat. ord., *Rubiaceæ*; Tribe, *Hedyotideæ*.)

Stove evergreens, from South Africa, with pink flowers. Cuttings of young shoots in sandy soil, in a hotbed; sandy loam and fibry peat. Winter temp., 45° to 58°; summer, 60° to 75°. Propagated in spring, in a hotbed, the plants so raised will bloom freely in the greenhouse during the summer.

P. carnea. 1½. May. 1842. B. M. t. 4086. B. R. 1844, t. 32. — — *kermesina*. Carmine-rose, violet. Rev. Hort. 1870, p. 130. — *parviflora*. 2. May.

Pentlandia. (Named after J. P. Pentland, Esq., consul-general in Peru. Nat. ord., *Amaryllidææ*.) See *Urceolina*.

Pentstemon. (From *pente*, five, and *stemon*, a stamen; four fertile and one abortive stamen. Nat. ord., *Scrophulariaceæ*; Tribe, *Cheloneæ*. Allied to *Chelone*.)

Seeds sown in a hotbed, in spring, the plants will bloom in the flower-garden the same summer; division of the plant in spring, as growth commences; cuttings of the young shoots any time in spring, summer, or autumn, under a hand-light, in sandy soil; sandy loam and leaf-mould. *Gentianoides* and its varieties, *coccinea* and *alba*, require a little protection in winter, when north of London; a few fir-boughs and some moss among the plants will generally be sufficient; but, to make sure, a few cuttings should be kept over the winter in a cold pit.

HALF-HARDY HERBACEOUS.

Pentzia. (After Charles John Pentz, a pupil of Thunberg. Nat. ord., *Compositæ*.)

A small greenhouse shrub. For culture, see TANACETUM.

P. flabelliformis. 2½. Yellow. Summer. South Africa. 1774. Syn., *Tanacetum flabelliforme*. B. M. t. 212.

Peony. *Paeonia*.

Peperomia. (From *peper*, pepper, and *omoios*, similar. Nat. ord., *Piperaceæ*; Tribe, *Piperæ*.)

Stove ornamental-leaved plants. For cultivation, see PIPER.

- P. acuminata*. Leaf ribs dark-green, red beneath. Peru. 1865.
- *argyreia foliis variegatis*. Garden variety. Wien. Gart. Zeit. 1883, p. 297, t. 3.
- *arifolia*. Leaves variegated green and grey. Brazil. 1864.
- *Botte'rii*. Green. Mexico. 1869.
- *ebu'rneae*. Leaves green, with ivory-white stalks. Columbia. 1871.
- *heterostachya*. Leaves with pale ribs. Peru. 1869.
- *maculosa*. Leaf-ribs grey, stalks spotted.
- *magnoliifolia*. Green. W. Indies. 1868.
- *marmorata*. Leaves dark green, banded and marbled with grey. S. Brazil. 1866. Syn., *P. arifolia* of some gardens.
- *microphylla*. Green. Mexico. 1860.
- *nummulariifolia*. S. Brazil. 1866. Well adapted for covering the sides of hanging baskets.
- *pellucida*. 1-1½. Green. Tropical America. 1867.
- *pellucida*. Leaves green, with a few green longitudinal bands. Brazil. 1864.
- *prostrata*. 1879.
- *puberula*. Green. Guatemala. 1870.
- *pubifolia*. Leaves with a grey central bar.
- *resediflora*. 1. White. Summer. Columbia. 1870.
- *Saundersii*. Leaves variegated green and grey. S. Brazil. 1866. Syns., *P. arifolia*, var. *argyreia* and *P. Verschaaffeltii*.
- *velutina*. Leaves dark green, with grey bands. Ecuador. 1872.

Pepinia. (Dedicated to *M. Pepin*, head gardener of the Museum of Natural History of Paris. Nat. ord., *Bromeliaceæ*; Tribe, *Pitcairniæ*.) See **Pitcairnia**.

P. aphelandrasiflora. See *Pitcairnia aphelandrasiflora*.

Pepper. *Piper*.

Peppermint. *Me'ntha piperi'ta*.

Pepper Vine. *Ampelopsis bipinnata*.

Pepperwort. *Lepidium*.

Perdicium. (Nat. ord., *Compositæ*; Tribe, *Mutisiaceæ*.) See **Trixis**.

P. brasiliense. See *Trixis auriculata*.

— *chilense*. A synonym of *Chatanthera chilensis*.

— *roseum*. A synonym of *Leuceria runcinata*.

Pereira. (After *Dr. Pereira*. Nat. ord., *Menispermaceæ*; Tribe, *Tinosporæ*.) See **Coscinium**.

P. medica. A synonym of *Coscinium fenestratum*.

Perennial. A plant of any kind that lives for more than two years.

Pere'skia. Barbadoes Gooseberry. (Named after *Pieresk*, a French patron of botany. Nat. ord., *Cactaceæ*; Tribe, *Opuntiacæ*. Allied to *Cactus*.)

Stove succulents. Cuttings in sandy loam, in heat, at almost any time; sandy loam, lime-rubbish, and a little peat and old cow-dung. Winter temp., 40° to 55°; summer, 60° to 80°.

P. aculeata. 5. White. October. W. Ind. 1696. B. R. t. 1928.

- P. Ble'o.* 5. Pale red. November. Mexico. 1827. B. M. t. 3478.
 — *crassicaulis*. Mexico. 1838.
 — *grandiflora*. Red. Mexico. 1838.
 — *grandifolia*. 3. Brazil. 1818.
 — *grandispina*. Mexico. 1818.
 — *longispina*. 4. S. Amer. 1808.
 — *Petitche*. Mexico. 1838.
 — *portulacaefolia*. 3. Purple. W. Ind. 1820.
 — *subulata*. Valparaiso.

Peresia. (After *Lazarus Perez*, a Spanish apothecary of the sixteenth century. Nat. ord., *Compositæ*; Tribe, *Mutisiaceæ*. Syns., *Homoianthus* and *Clarionea*.)

Hardy perennial. For culture, see CINERARIA
P. viscosa. Purple. Chili. 1863. Syn., *Homoianthus viscosus*.

Pergularia. (From *pergula*, trellis-work; referring to its quick climbing growth. Nat. ord., *Asclepiadaceæ*. Allied to *Stephanotis*.)

Stove evergreen climbers. Cuttings of firm side-shoots in sand, under a glass, and in bottom-heat; fibry loam, sandy peat, leaf-mould, and dry cow dung. Winter temp., 55° to 65°; summer, 60° to 85°.

- P. glabra*. See *Vallis pergilana*.
 — *minor*. 8. Yellow, green. June. E. Ind. 1790. Andr. Rep. t. 134.
 — *odoratissima*. 15. Green. June. E. Ind. 1784. Andr. Rep. t. 185.
 — *sanguinolenta*. 6. Green, yellow. July. Sierra Leone. 1822. B. M. t. 2532.

Pericome. (From *peri*, around, and *kome*, hair. Nat. ord., *Compositæ*; Tribe, *Helenoideæ*.)

Hardy annual.
P. caudata. 3-4. Golden-yellow. October. Colorado. 1880.

Perilla. (Unexplained. Nat. ord., *Labiatae*; Tribe, *Satureineæ*.)

Half-hardy annuals. Seeds. For cultivation, see ANNUALS.

- P. arguta atropurpurea*. See *P. nankinenses*.
 — *heteromorpha*. See *P. ocimoides*.
 — *nankinenses*. Leaves dark-purple. China. Syn., *P. arguta*, var. *atropurpurea*.
 — *ocimoides*. 3. White. August. E. Indies. 1770. Syn., *P. heteromorpha*.
 — *crispa*. 3. Purple. August. China.

Perilomia. (From *peri*, around, and *loma*, a margin; referring to the membranous border of the fruit. Nat. ord., *Labiatae*; Tribe, *Stachydeæ*. Allied to *Scutellaria*.)

Half-hardy evergreen shrub. Cuttings of young shoots in sand, under a glass in April; sandy peat. Winter temp., 40° to 45°.

- P. scutellarioides*. 3. Purple. August. Peru. 1829. Syn., *P. ocimoides*. B. R. t. 1394.

Periphragmos. (From *peri*, around, and *phragmos*, a fence. Nat. ord., *Polemoniaceæ*.) See *Cantua*.

- P. dependens* and *P. uniflorus*. Synonyms of *Cantua ovata*.
 — *flesuosa* and *P. pyriformis*. Synonyms of *Cantua pyriformis*.

Periploca. (From *periploke*, an in-

tertwining; referring to the habit of the plant. Nat. ord., *Asclepiadaceæ*; Tribe, *Periploceæ*.)

Hardy deciduous twiners. Layers and cuttings under a glass, during summer and autumn. Any good soil will do. *Græca* will soon cover an arbour or wall. The tender species are not worth culture.

- P. africana*. Purple, white. Autumn. 1726. Andr. Rep. t. 557.
 — *angustifolia*. 6. Purplish. South Europe. 1800.
 — *græca*. 10. Brown. July. Syria. 1597. B. M. t. 2289.

Peristeria. Dove Flower. (From *peristera*, a dove; dove-like appearance of the column. Nat. ord., *Orchideæ*; Tribe, *Vandæe-Stanhopeæ*. Allied to *Acineta*.)

Stove orchids. Division, or separating the pseudo-bulbs, as growth commences. See ORCHIDS.

- P. aspersa*. Yellow-brown, dotted with brownish-red; lip dark crimson. Venezuela. Lind. t. 267.
 — *Barkeri*. Bate Orch. t. 8, B. M. t. 4203. See *Acineta Barkeri*.
 — *cerina*. B. R. t. 1953. See *Lycomormium cerinum*.
 — *elata*. 4. White. July. Panama. 1826. B. M. t. 3116.
 — *ephippium*. Yellowish or white. Western S. America. G. C. 1883, xx. p. 198.
 — *expansa*. White. July. Panama. 1839.
 — *fulva*. A synonym of *Acineta Humboldtii*.
 — *guttata*. Kn. and West, t. 70. See *Lycomormium guttatum*.
 — *Humboldtii*. B. R. 1843, t. 18, and var. *fulva*. Synonyms of *Acineta Humboldtii*.
 — *læta*. Bright yellow, dark purple. G. C. 1887, ii. p. 616.
 — *lentiginosa*. Yellow. May. Guiana. 1837.
 — *peñula*. 1. White-spotted. September. Panama. B. M. t. 3479.
 — *Rossiana*. Yellowish. G. C. 1889, v. p. 8.
 — *setigera*. Yellowish. G. C. 1887, ii. p. 272.
 — *stapelioides*. Yellow, brown. May. Spanish Main. 1839.

Peristrophe. (From *peristrophe*, turning round because the corolla is twisted so as to be upside down. Nat. ord., *Acanthaceæ*; Tribe, *Justicieæ*. Allied to *Hypoestes*.)

Stove herbaceous or sub-shrubby perennials. For cultivation, see JUSTICIA.

- P. lanceolaria*. Purple. Moulmein. 1866. B. M. t. 5566. Syn., *Justicia lanceolaria*.
 — *saticifolia*.
 — *au'neo-variegata*. Rose; leaves with central feathered golden stripe. Java. 1871.
 — *speciosa*. 4. Pale purple, carmine. Winter. India. 1826. Syn., *Justicia speciosa*. B. M. t. 2722.
 — *tinctoria*. 1. Pink. August. India. 1815. Syn., *Justicia Roxburghiana*.

Peritoma. (From *peritome*, a cutting round about. Nat. ord., *Cappariaceæ*.) See *Cleome*.

P. aurea See *Cleome lutea*.

Periwinkle. *Vi'nea*.

Pernettia. (Named after *Don Per-netty*, author of "A Voyage to the

Falkland Islands." Nat. ord., *Ericaceæ*; Tribe, *Arbuteæ*. Allied to *Gaultheria*.)

Hardy evergreen, white-flowered shrubs. Seeds and layers in spring; peat border; requires similar treatment to the tenderer Azaleas and Rhododendrons.

- P. angustifolia*. 2. June. Valdivia. 1834.
B. M. t. 3889. A variety of *P. mucronata*.
— *ciliaris*. 3. Mexico. Journ. Hort. Soc. vi. p. 268.
— *Cumini ngii*. May. Mexico.
— *floribunda*. Berries crimson. Extra-tropical S. America. G. C. 1882, xviii. p. 648, fig. 113.
— *fulrens*. White. March. Chili.
— *mucronata*. 6. May. Magellan. 1828. B. R. t. 1675. Syn., *Arbutus mucronata*, B. M. t. 3093.
— *Pentlandii*. White; fruit blue-black. June. Andes. 1875. B. M. t. 6204.
— *piloosa*. April. Mexico. 1839.
— *prostrata*. May.
— *pubula*. 4. June. Magellan. 1825.

Peronia. A synonym of *Thalia*.

Peronospora. See Potato Disease.

Persea. Avocado or Alligator Pear. (Name of a tree from Theophrastus. Nat. ord., *Laurinææ*; Tribe, *Perseaceæ*.)

Stove evergreen tree. Layers of ripened shoots in autumn; cuttings of firm shoots in May, in sand, under a bell-glass, and in bottom-heat; sandy loam and fibry peat. Winter temp., 50° to 60°; summer, 60° to 90°.

- P. gratissima*. 40. Green. W. Ind. 1739.
B. M. t. 4580.

Persian Sun's Eye. *Tuli'pa o'culus solis*.

Persica. Peach. (From *Persia*, its supposed native place. Nat. ord., *Rosaceæ*; Tribe, *Prunææ*.)

Closely allied to *Amygdalus*. See NECTARINE and PEACH. All bloom in April.

- P. Davidiana*. Pale rose or white. China. Rev. Hort. 1872, p. 75.
— *laevis*. See *P. vulgaris*, var. *laevis*.
— *vulgaris*. 15. Red. Persia. 1562. Syn., *Prunus Persica*. Peach.
— *alba*. 14. White. Persia.
— *compressa*. 15. Red.
— *fo're-plé'no*. 15. Red. Persia.
— *fo'tis variegat'is*. 15. Persia.
— *fru'cto plé'no*. 15. Red. China. 1845.
— *hispanica*. White. Spain. 1847.
— *laevis*. 15. Red. Persia. 1562. Syns., *P. laevis* and *Amygdalus persica*. Nectarine.
— *pe'ndula*. White. 1842.
— *sanguinea plé'na*. 15. Red. China. 1845.

Persimmon. *Diospyros virginiana*-na.

Persoonia. (Named after C. H. Persoon, a distinguished botanist. Nat. ord., *Proteaceæ*; Tribe, *Persooniææ*.)

Greenhouse evergreen shrubs, from New South Wales, yellow-flowered, except where otherwise mentioned. Cuttings of ripened shoots in sand, under a bell-glass, in spring, and kept in a temperate pit until roots are formed; fibry loam and

sandy peat. Winter temp., 38° to 45°; summer, 60°; a little shaded.

- P. acerifolia*. Orange. July. 1824. Syn., *P. pallida*.
— *brevifolia*. 1840.
— *chancepitius*. 4. June. 1824.
— *ferruginæa*. 3. Yellow, red. June. 1823.
— *flexifolia*. See *P. nutans*.
— *Fraseri*. See *P. saccata*.
— *heterophylla*. Swan River.
— *hirsuta*. 4. June. 1800.
— *juniperifolia*. 4. June. 1826.
— *lanceolata*. 4. June. 1791. Andr. Rep. t. 74.
— *latifolia*. 4. June. 1795. Andr. Rep. t. 280.

— *pa'ulida*. See *P. acerosa*.
— *pinifolia*. 4. June. 1822.
— *pruinosa*. 3. June. 1824.
— *saccata*. 2-6. July. 1837. Syns., *P. Fraseri* and *P. macrostachya*.
— *sabiceana*. 7. Pink. July. 1795.
— *sea'bra*. 4. June. 1824.
— *spathulata*. June. 1824.
— *tenuifolia*. June. 1822.
— *To'ro*. Summer. New Zealand.

Peru Balsam-tree. *Myroxylon*.

Peruvian Bark. *Cincho'na*.

Peruvian Daffodil. *Isme'ne*.

Peruvian Mastic. *Schi'nus*.

Perymenium. (Meaning not explained. Nat. ord., *Compositæ*; Tribe, *Helianthoidææ*.)

Cuttings, taken from the points of shoots, or the firm side-shoots; sandy loam and a little peat. Winter temp., 38° to 48°.

- P. Barclayana*. Copper. July. Mexico. 1830.

Pescatorea. (Commemorative. Nat. ord., *Orchidææ*; Tribe, *Vandææ-Cyrtopodiææ*.) See *Zygopetalum*.

- P. Backhousiana*. See *Zygopetalum Backhousiana*.
— *bellæ*. See *Zygopetalum bellum*.

P. Vervœti. Flor. and Pom. 1833, p. 10.
— *Wallisii.* Fl. Ser. t. 1828. See *Zygopetalum Wallisii.*

Pesome'ria. (From *piptopesi*, to fall, and *meros*, a part: the sepals fall off soon after expansion. Nat. ord., *Orchidææ*; Tribe, *Epidendrææ-Bleticææ.* Allied to *Bletia*.) See **Phaius**.

P. tetragona. See *Phaius tetragonus*.

Petala'cte. (From *petalon*, a petal, and *acte*, a ray. Nat. ord., *Compositææ*; Tribe, *Inuloideææ.* Allied to *Antennaria*. Syn., *Petalolepis*.)

Greenhouse evergreen shrubs, from Cape of Good Hope. Cuttings of young side-shoots, getting firm at the base, in sand, under a bell-glass, in May; sandy loam and fibry peat, with pieces of charcoal, and well-drained pots. Winter temp., 38° to 48°.

P. bicolor. Purple, white. May. 1816. Syn., *Petalolepis bicolor*.
— *coronata.* White. May. 1816.

Petali'dium. (From *petalon*, a petal; referring to the conspicuous flowers. Nat. ord., *Acanthaceææ*; Tribe, *Ruellieææ.* Allied to *Ruellia*.)

Stove evergreen climber. Cuttings of shoots in April or May, in sandy loam, in a hotbed; sandy, fibry loam, and a little peat. Winter temp., 48° to 60°; summer, 60° to 80°.

P. barberiodes. 4. White. June. India. B. M. t. 4053.

Petalole'pis. (From *petalon*, a petal, and *lepis*, a scale. Nat. ord., *Compositææ*; Tribe, *Inuloideææ.*) See **Petalacte**.

P. bicolor. See *Petalacte bicolor*.

Petaloste'mon. (From *petalon*, a petal, and *stemon*, a stamen; stamens joined to the bottom of the petals. Nat. ord., *Leguminosææ*; Tribe, *Galegeææ.* Allied to *Dalea*.)

Hardy North American herbaceous perennials. Division in spring; sandy loam, and a little peat or leaf-mould.

P. ca'ndidus. 1. White. July. 1811.
— *ca'rneus.* $\frac{1}{2}$. Flesh. July. 1811.
— *corymb'sus.* $1\frac{1}{2}$. White. August. 1811.
— *foli'sus.* Rose-purple. 1882.
— *villo'sus.* Red. July. 1826.
— *viol'a'ceus.* 1. Violet. August. 1811. B. M. t. 1707.

Petasi'tes. (From *petasos*, an umbrella; alluding to the leaves. Nat. ord., *Compositææ.*)

Hardy, perennial herbs, generally covered with white tomentum.

P. fra'grans. $\frac{1}{2}$. White. February. S. W. Europe. 1806. Syn., *Tussilago fragrans*. B. M. t. 1388.
— *fr'i'gida.* $\frac{1}{2}$. White. April. Arctic regions. 1778. Syn., *Tussilago frigida*.
— *ni'va.* 1. White. Europe. 1713.
— *vulga'ris.* $\frac{1}{2}$ - $1\frac{1}{2}$. Yellow. March. Britain. Eng. Bot. ed. 3, t. 783-4. Syns., *Tussilago hybrida* and *T. Petasites*.

Petaso'stylis. (Derivation uncer-

tain. Nat. ord., *Gentianaceææ*; Tribe, *Chironieææ.*) See **Leianthus**.

P. nigre'scens. See *Leianthus nigrescens*.

Petive'ria. (Named after *J. Petiver*, an English naturalist. Nat. ord., *Phytolaccæææ*; Tribe, *Rivineææ.*)

Stove evergreen, West Indian, white flowered shrub. Cuttings of half-ripened shoots in May, in sand, under a bell-glass, and in a sweet bottom-heat; peat and sandy loam. Winter temp., 48° to 60°; summer, 60° to 85°.

P. allia'cea. 2. June. 1737.

— *octa'ndra.* A synonym of *P. alliacea*.

Pet'rea. (Named after *Lord Petre*. Nat. ord., *Verbenaceææ*; Tribe, *Verbeneææ.* Allied to *Duranta*.)

Stove evergreen trees. Cuttings of short, firm side-shoots in summer, in sand, under a bell-glass, and in bottom-heat; rich, sandy loam. Winter temp., 60°; summer, 60° to 90°.

P. arbo'rea. 10. Blue. S. Amer. 1823. Syn.,
P. erecta. B. C. t. 1606.

— *ere'cta.* See *P. arborea*.

— *macrosta'chya.* 20. Lilac. June. S. Amer.

Twiner. Syn., *P. Stapelieææ.*

— *rufo'sa.* 10. Blue. Caraccas. 1824.

— *Stape'lieææ.* Violet-purple, yellow. June. Paxt.

Mag. iv. p. 199.
— *volu'bilis.* 20. Purple. July. Vera Cruz. 1733. Twiner. B. M. t. 628.

Petro'bium. (From *petros*, a rock, and *bio*, to live; rock inhabiting. Nat. ord., *Compositææ.*)

Ornamental stove tree. Sandy loam. Cuttings. *P. arbo'reum.* Yellow. June. St. Helena. 1816.

Petroca'llis. (From *petros*, a rock, and *kalos*, beautiful; pretty rock-plant. Nat. ord., *Crucifereææ*; Tribe, *Alyssineææ.*) See **Draba**.

P. pyrena'ica. B. C. t. 635. See *Draba pyrenaica*.

Petroca'rya. (From *petros*, stone, and *carya*, the walnut. Nat. ord., *Rosaceææ.*) See **Parinium**.

P. campe'stris. See *Parinium campestre*.

Petroco'ptis. A section of **Lychnis**.

Petro'phila. (From *petros*, a rock, or stone, and *phileo*, to love; referring to their natural habitation. Nat. ord., *Proteaceææ*; Tribe, *Proteæææ.* Allied to *Protea*.)

Greenhouse, evergreen, white-flowered, Australian shrubs. Cuttings of ripe shoots in spring, under a bell-glass, and placed in a cold frame; fibry, rather tenacious loam, and a little peat. Winter temp., 88° to 48°.

P. acicula'ris. 2. May. B. M. t. 3469. Syn.,
P. filifolia.

— *brevifo'lia.* B. E. t. 1839. See *P. media*.

— *fastigia'ta.* 5. July. 1820.

— *filifo'lia.* See *P. acicularis*.

— *glandul'i'gera.* See *P. Serrurieææ.*

— *heterophy'lia.* W. Australia.

— *juncifo'lia.* See *P. media*.

— *me'dia.* Syns., *P. brevifolia* and *P. junci-*

folia.

- P. pedunculata*. 4. July. 1824.
 — *puiche'lla*. 5. July. 1790. Syn., *Protea*
puichella. B. M. t. 796.
 — *ri'gida*. 5. June. 1823.
 — *Serru'ria*. 3. May. 1840. Syn. *P. glandu-*
liger.
 — *terretifolia*. 4. July. 1824.
 — *trifida*. 4. July. 1820.

Petroselinum sativum. A synonym of **Carum Petroselinum**.

Pette'ria. (After Franz Petter, a botanical traveller in Dalmatia. Nat. ord., *Leguminosæ*.)

Hardy shrub, requiring the same culture as **CYTISUS**.

- P. ramenta'cea*. 10. Yellow. May. Dalmatia. 1840. Syn., *Cytisus Weidenii*. B. R. 1843, t. 40.

Pettigree or Pettigree. *Ru'scus aculeatus*.

Petty-Whin. *Geni'sta a'nglica*.

Petu'nga. (Its Indian name. Nat. ord., *Rubiaceæ*; Tribe, *Gardenieæ*.)

Stove evergreen shrub. Cuttings of half-ripened shoots in sand, under a bell-glass, and in a slight bottom-heat; sandy loam and fibry peat. Winter temp., 50° to 60°; summer, 60° to 80°.

- P. Roxbu'rgii*. 3. White. May. E. Ind. 1818.

Petu'nia. (From *petun*, Brazilian name for tobacco, to which *Petunia* is allied. Nat. ord., *Solanaceæ*; Tribe, *Salpiglossideæ*.)

Half-hardy herbaceous perennials. Seeds sown in a hotbed, in March; seedlings pricked out, and finally transplanted into the borders in May; cuttings of the points of shoots, or small side-shoots, in spring, in heat, and in summer and autumn without heat, except being covered with glass; scarcely any of them will stand frost. It is best to keep the plants in a cold, dry pit during the winter; for growing, light, rich, sandy loam. Temp., not below 38° in winter.

- P. acuminata*. See *Nicotiana acuminata*.
 — *compacta elegantissima*. Mauve. 1881.
 — *intermedia*. 1. Yellow, purple. August. Buenos Ayres. 1832. B. R. t. 1931. Syn., *P. linearis*, *Paxt. Mag. v. p. 219*, *Nierembergia linearis*, and *Salpiglossis linearis*. B. M. t. 3256.
 — *meled'gris*. White, blue. 1849. A hybrid? Fl. Ser. t. 550.
 — *nyctaginiflora*. 4. White. August. S. Amer. 1823. B. M. t. 2552.
 — *phœni'cea*. 2½. Crimson, purple. June. Buenos Ayres. 1831.
 — *punctata*. Deep blue, white, rosy crimson. 1844. *Paxt. Mag. xi. p. 7*.
 — *viola'cea*. Rose, purple. August. Buenos Ayres. 1831. B. M. t. 3556. Syn., *Nierembergia phœnicea* and *Salpiglossis integrifolia*. B. M. t. 3113.

Peuce'danum. (A name used by Hippocrates. Nat. ord., *Umbellifereæ*. Syn., *Pastinaca*.)

For culture, see **PARSNIP**.

- P. sativum*. 2. Bright yellow. July. Britain. Syn., *Pastinaca sativa*. Eng. Bot. ed. 3, t. 612.

Peu'mus. (From the Chilian name. Nat. ord., *Monimiaceæ*. Syn., *Boldoa*.) Greenhouse, evergreen tree. Sandy peat. Cuttings.

- P. fra'grans*. 20. White. May. Chili. 1844. B. M. t. 7024. Syn., *P. Boldus* and *Boldoa fragrans*

Peyrou'sia. (Named after *La Peyrouse*, the French navigator. Nat. ord., *Irideæ*; Tribe, *Iaxieæ*.) Now known as **Lapeyrousia**, under the specific names annexed.

Greenhouse bulbs, from South Africa, and blue-flowered, except where otherwise specified. For culture, see **LIXA**.

- P. aculeata*. A synonym of **LAPEYROUSIA ANCEPS**.
 — *d'nceps*. ½. Blue, yellow. September. 1824. **LAPEYROUSIA ANCEPS**.
 — *corymbo'sa*. ½. May. 1791. **LAPEYROUSIA CORYMBO'SA**.
 — *Fabri'ci*. ½. May. 1825. **LAPEYROUSIA FABRICII**.
 — *falca'ta*. ½. May. 1825.
 — *fascicula'ta*. ½. May. 1825. **LAPEYROUSIA FASCICULATA**.
 — *fistifolia*. ½. Violet. August. 1809. **LAPEYROUSIA FISSIFOLIA**.
 — *silenoides*. ½. Violet. June. 1822. **LAPEYROUSIA SILENOIDES**.

Pfa'fia. (After C. H. Pfaff, once Professor of Chemistry at Kiel. Nat. ord., *Amaranthaceæ*.)

Stove, perennial herb. For culture, see **CELOSIA**.

- P. gnaphalioides*. 1. White. June. Brazil. 1822.

Pfeiffera. (In honour of *Dr. L. Pfeiffer*, a botanist, who has attentively studied *Cacti*. Nat. ord., *Cactaceæ*.) See **Rhipsalis**.

- P. cereiformis*. See *Rhipsalis cereiformis*.

Pha'ca. (Name of a plant mentioned by Dioscorides. Nat. ord., *Leguminosæ*.) United with **Astragalus** in the **Genera Plantarum**.

Hardy herbaceous perennials. Seeds sown in a little heat, in April, and seedlings planted out, will bloom the same season; many will do so if sown in good places in the open air; division of the roots in spring; cuttings under a hand-light, in summer; sandy loam. *Cane scens* requires protection from frost in winter.

- P. alpi'na*. 2. Pale yellow. July. Austria. 1759. Jacq. Ic. t. 151. Syn., *Astragalus penduliflorus*.
 — *dahu'rica*. Pale yellow. Dahuria. 1820.
 — *arena'ria*. ½. Cream. July. Siberia. 1796. Syn., *Astragalus chorinensis*.
 — *astragali'na*. 1. White, blue. July. Scotland. Syn., *Astragalus alpinus*.
 — *austra'lis*. ½. Pale purple. May. South Europe. 1779. B. C. t. 490. Syn., *Astragalus australis*.
 — *ba'tica*. 4. White. May. Spain. 1640. Syn., *Astragalus lusitanicus*.
 — *cane'scens*. 1. Pale rose. July. Valparaiso. 1831.
 — *densifolia*. 1. Red. July. California. 1822. Syn., *Astragalus Crotalaria*.
 — *exalta'ta*. 1. Yellow. July. Altai. 1823.
 — *florida'na*. See *Sesbania vesicaria*.

- P. frigida*. 1. Cream. July. Austria. 1795.
Syn., *Astragalus frigida*.
— *glabra*. A synonym of *P. australis*.
— *lappo'nica*. $\frac{1}{2}$. Purple. July. North Europe.
1816. Syn., *Astragalus creticus*.
— *lutca*. 1. Yellow. July. Siberia. 1827.
— *oroboides*. 1. Purple. July. Norway. 1820.
Syn., *Astragalus oroboides*.
— *triangularis*. 1. Blue. July. Siberia. 1824.
Syn., *Astragalus triangularis*.

Phacelia. (From *phakelos*, a bundle; the disposition of the flowers. Nat. ord., *Hydrophyllaceae*; Tribe, *Phacelariæ*. Syn., *Cosmanthus*, *Eutoca* and *Whittlavia*.)

Annuals, by seeds; perennials, by seed and division in April; sandy, common garden-soil.

HARDY ANNUALS.

- P. campanularia*. $\frac{1}{2}$. Bright blue. July. S. California. 1832. B. M. t. 6735.
— *congesta*. $\frac{1}{2}$. Purple, blue. June. Texas. 1835. B. M. t. 3452.
— *divaricata*. Light violet. May. N. America. 1833. Syn., *Eutoca divaricata*. B. M. t. 3706.
— — *Wrangelia*'na. 1. Blue. August. N. America. 1835. Syn., *Eutoca Wrangeliana*. Swt. Fl. Gard. ser. 2, t. 363.
— *ambriata*. Lilac, white. N. America.
— *grandiflora*. 5. Violet-purple. Summer. California. Syn., *Eutoca grandiflora* and *Cosmanthus grandiflorus*, B. M. t. 5029.
— *Menziesii*. Purple. June. N. America. 1826. Syn., *Eutoca Menziesii*, B. M. t. 3762, and *E. multiflora*, B. M. t. 1180.
— *Orcuttia*'na. White, yellow. California. 1890.
— *Parryi*. Violet, spotted with yellow. California. 1835. B. M. t. 6842.
— *parviflora*. Blue. June. N. America. 1826. Syn., *Eutoca parviflora*.
— *tanacetifolia*. 2. Blue. June. California. 1832.
— *Whittlavia*. 2. Blue. June. California. B. M. t. 4813.
— *viscida*. 2. Brown, rose. N. America. 1834. Syn., *Eutoca viscida*, B. M. t. 3572.

HARDY HERBACEOUS.

- P. A'idea*. $\frac{1}{2}$. Pink. June. Peru. 1824.
— *bipinnatifida*. 2. Blue. June. N. Amer. 1824.
— *circinata*. $\frac{1}{2}$. Pink. June. Magellan. 1817.
— *Franklinii*. 1. Pink. May. N. America. 1827. Syn., *Eutoca Franklinii*. B. M. t. 2985.
— *sericea*. 1. Blue. June. N. America. 1827. Syn., *Eutoca sericea*. B. M. t. 3003.

Phædrana'ssa. (From *phaidros*, gay, and *anassa*, queen. Nat. ord., *Amaryllidæ*; Tribe, *Amaryllæ*. Allied to *Coburgia*.)

American bulbs, requiring the protection of a greenhouse, and succeed best in a strong, yellow loam, like *Coburgia*; they rest in winter, or may be made to rest in summer. For culture, see *COBURGIA*.

- P. Carmali*. 2. Red, green. Costa Rica. 1868. Ref. Bot. t. 46. Stove.
— *chlora'ca*. 1. Crimson, green. December. 1844. B. R. 1845, t. 17.
— — *obtus*'sa. December. 1844. Syn., *P. obtusa*.
— *eucrosioides*. 1. Green, red. Ecuador. 1878. Syn., *Leperiza eucrosioides*. Stove.
— *Lehma'nni*. Scarlet. Columbia. 1884. Stove.
— *obtus*'sa. See *P. chloracea*, var. *obtus*'sa.

- P. rubro-viridis*. 1. Green, bright red. April. Andes. Now known as *EUSTEPHIA COCCINEA*.
— *schizantha*. Bright red, green. October. Columbia. 1800.
— *viridiflora*. 1. Greenish-yellow. 1877.

Phænocodon. (From *phainos*, bloody, and *codon*, a bell. Nat. ord., *Liliacæ*; Tribe, *Luzuriacæ*.) A synonym of *Lapageria*.

Phæno'coma. (From *phainos*, bloody, and *come*, hair; colour of involucre. Nat. ord., *Compositæ*; Tribe, *Inuloideæ*. Allied to *Cassinia*.)

Greenhouse evergreen shrubs. Cuttings of young side-shoots, getting firm at the base, in sand, over peat, in pots three-parts filled with drainage, under a bell-glass, and kept near the glass of a house or pit in summer; sandy peat and a little fibry loam. Winter temp., 40° to 48°.

- P. prolifera*. 4. Crimson. September. Cape of Good Hope. 1789. Syn., *Helichrysum proliferum*, B. M. t. 2365, and *Xeranthemum proliferum*, Andr. Rep. t. 374.

Phænogams. Flowering plants, i.e., those provided with stamens and ovules.

Phænosp'erma. (From *phaios*, greyish, and *sperma*, a seed; seeds greyish. Nat. ord., *Gramineæ*.)

Hardy grass. Seeds grown in spring. Common garden-soil.

- P. globosa*. China. 1874.

Phaiocalanthe. (A name given to hybrids between *Phaius* and *Calanthe*. Nat. ord., *Orchidæ*.)

For culture, see *ORCHIDS*.

- P. irrorata*. Cream, rosy-pink. 1867. A hybrid between *Phaius grandifolius* and *Calanthe vestita*.
— *Sedenia*'na. Milk-white, sulphur, light purple. 1887. Hybrid between *Calanthe Veitchii* and *Phaius grandifolius*. Syn., *Phaius Sedenianus*.

Phaius. (From *phaios*, shining; referring to the flowers. Nat. ord., *Orchidæ*; Tribe, *Epidendræ*-*Bleticæ*. Allied to *Bletia*.)

Stove orchids. Division of the pseudo-bulb-like shoots, as growth commences, in spring; grown in pots. See *ORCHIDS*.

- P. albus*. 2. White. July. Sylhet. 1836. Syn., *Thunia alba*. B. M. t. 3991.
— — *flavo-ir'netus*. Tinged with yellow. 1833.
— *angustifolius*. Green. July. Trinidad. 1821.
— *Bensonia*'na. 1. Purple, yellow. July. Rangoon. 1867. Syn., *Thunia Bensonia*. B. M. t. 5694.
— *Blumei*. Cinnamon-red, white. April. 1879.
— — *assamicus*, G. C. 1882, xvii. p. 558.
— — *Bernardysii*. 3. Sulphur-yellow. Queensland. 1873. B. M. t. 6032.
— *bicolor*. 2. Maroon, white. July. Ceylon. 1837. B. M. t. 4078.
— *callosus*. Reddish-brown. March. Java. 1848. Syn., *Limodorum callosum*.
— *candidissimus*. White. Syn., *Thunia candidissima*.

- P. Cookso'ni*. Hybrid between *P. tuberculosus* and *P. Wallichii*. G. C. 1890, vii. p. 388, fig. 57.
- *Dodgso'ni*. White, yellow. India. 1877.
- *fa'vus*. Yellow. India. 1837.
- *grandifo'lius*. White, brown. April. China. 1778. Syns., *Bletia Tankervilleae*, B. M. t. 1924, and *Limodorum Tankervilleae*, Andr. Rep. t. 426.
- *superbus*. A grand variety.
- *Humboldtii*. Rosy, white, red. Madagascar. 1880.
- *inquili'nus*. Cream, with yellow keels. 1867. A hybrid.
- *intermedius*. India. 1839.
- *irroratus*. See *Phaiocalanthe irrorata*.
- *macula-to-grandifo'lius*. A hybrid. G. C. 1881, x. p. 591.
- *maculatus*. 2. Yellow. June. Nepal. 1829. B. M. t. 3960. Syn., *Bletia Woodfordii*, B. M. t. 2719.
- *Ma'nnii*. A form of *P. Wallichii*. G. C. 1889, v. p. 714.
- *Marshalliae*. 2. White, lemon. 1871. Syn., *Thunia Marshalliae*. Varieties of this are *ionophlebia*, *purpurata*, and *triloba*.
- *philippine'nsis*. Reddish-orange-brown; lip white. Philippines. G. C. 1889, vi. p. 239.
- *Robertsonii*. Brownish-yellow, red. New Caledonia. G. C. 1884, xxii. p. 428.
- *Sedeniana'nis*. See *Phaiocalanthe Sedeniana*.
- *tetragonus*. 2. Brown. December. Mauritius, 1837. Syn., *Pesomeria tetragona*, B. M. t. 4442.
- *tuberculosus*. Snow-white, yellow, brown. Spring. Madagascar. 1881.
- *Veitchiana'nis*. White, purple-mauve. 1885. Hybrid between *P. Marshalliae* and *P. Bensoniae*.
- *Wall'chii*. 2. Orange, yellow. April. Khasia. 1837.
- Phalæno'psis**. Butterfly - Plant. (From *phalaina*, a moth, and *opsis*, like; the appearance of these handsome flowers. Nat. ord., *Orchidæ*; Tribe, *Vandæe-Sarcantheæ*.)
- Stove orchids, grown in baskets or on blocks. Pieces of offset-shoots, kept dry at the base, for a day or two, before setting them growing. See ORCHIDS.
- P. alceio'rnis*. Creamy-white, yellowish. G. C. 1887, i. p. 799.
- *ambilis*. 1½. White, pink. Autumn. Java. 1847. Syn., *P. grandiflora*, B. M. t. 5184. See also *P. Aphrodite*.
- *Dayana*. White, carmine. Indian Archipelago. Syn., *P. Aphrodite*, var. *Dayana*.
- *longifolia*. White. Manilla. 1842.
- *rotundifolia*. White. Manilla. 1837.
- *amethystina*. Cream-coloured, with amethyst lip. Sunda Isles? 1865.
- *antennifera*. Orange, purple. Burmah. 1879.
- *Aphroditæ*. 1. White, crimson, orange, yellow. Manilla. 1836. Syn., *P. amabilis* of B. R. 1838, t. 34, Fl. Ser. t. 36, and Gf. 1887, p. 56.
- *Dayana*. See *P. amabilis*, var. *Dayana*.
- *Boza'lii*. Sulphur, brown, white. Philippines. 1883.
- *Buysoniana*. Bright purple, white, scarlet. August. G. C. 1888, iv. p. 295.
- *casta*. White, rosy-tinted. Philippines. 1875.
- *Corningtoniana*. Purple-brown yellowish, violet. 1879.
- *cornu-cervi*. Green, white, purple. June. Moulmein. 1864. Syn., *Polychilus cornu-cervi*. B. M. t. 5570.
- *Cy'nthia*. A natural hybrid between *P. Schilleriana* and *P. Aphrodite*. G. C. 1890, vii. p. 132.
- P. delicat'a*. A supposed natural hybrid. G. C. 1882, xvii. p. 700.
- *denticulata*. 1. White, brown, yellowish. G. C. 1888, iii. p. 296.
- *equestr'is*. See *P. rosea*.
- *Esmeralda*. 1. Violet-purple, white. Cochinchina. 1877.
- *canad'ula*. White, rosy-purple. Cambodia. Lind. t. 263.
- *fasciata*. Philippines. 1882.
- *Foersteriana'ni*. White, brown, yellow. G. C. 1887, i. p. 244.
- *fusca'ta*. Yellowish, brown. June. Malay Peninsula. 1874.
- *gloriosa*. Perhaps a variety of *P. amabilis*. G. C. 1888, iii. p. 554.
- *grandiflora*. B. M. t. 5184. See *P. amabilis*.
- *Harrietæ*. Primrose, rosy-purple, orange. Hybrid between *P. amabilis* and *P. violacea*. Syn., *P. violacea-amabilis*. G. C. 1887, ii. p. 8, fig. 1.
- *intermedia*. White, pink. Philippines. Syn., *P. Lobbi*.
- *Brymeriana*. White, purple, crimson-violet. 1876.
- *Po'rtiei*. White, rosy-lilac. Philippines. 1867. Gard. March 4, 1882.
- *Le'da*. Rosy, purple, yellow. Hybrid.
- *leucorrh'oda*. White, purple, yellow. Philippines. 1875.
- *Lo'bbii*. See *P. intermedia*.
- *Lo'wii*. Yellow, purple. Borneo. 1862.
- *Luëddemanniana'na*. White, purple. Philippines. 1865.
- *amabilis*. Garden hybrid. G. C. 1888, iii. p. 331.
- *hieroglyphica*. Ochraceous, brown. Philippines. G. C. 1887, ii. p. 586.
- *ochracea*. Pale yellowish-rose, pale brown. Philippines.
- *pu'tehra*. Blackish-purple, blue. Philippines. 1875.
- *maculata*. Borneo. 1881.
- *Ma'nnii*. Yellow, brown, purple. India. 1871.
- *Mar'ice*. White, chocolate-red, magenta-purple. Borneo? 1883. Warn. Orch. Alb. t. 80.
- *Michol'tzi*. Creamy-white. Andamans. Gard xxxviii. p. 532.
- *Pari'shii*. ½. White, purple. May. Burmah. 1865.
- *Lo'bbii*. Lip white, with two brown bands. E. Himalaya. 1870.
- *Regnieriana*. Rose, dark purple, white. Siam. G. C. 1887, ii. p. 746.
- *Reichenbachiana'na*. Cream, crimson, rose, orange. 1882.
- *ro'sea*. White, pink, deep violet, orange. Manilla. 1848. B. M. t. 5212. Syn., *P. equestr'is*.
- *Rothschildiana'na*. Sulphur, purple, white, orange. Hybrid between *P. Schilleriana* and *P. amabilis*. G. C. 1887, i. p. 606.
- *Ru'ckeri*. White, yellow. Indian Archipelago. 1864.
- *Sanderiana'na*. Rosy, white, brown, purple, yellow. April. Philippines. 1883. Warn. Orch. Alb. t. 209.
- *marmorata*. Yellowish, purple.
- *Schilleriana'na*. Pink. January. Manilla. 1860. B. M. t. 5530. Syn., *P. amabilis* of Gf. 1888, p. 544.
- *advena*. Pale purple, white, yellow. 1885.
- *alba*. White, yellow. 1882.
- *immaculata*. Rosy, white, violet, yellow. Philippines. 1875.
- *splendens*. Rose, white, purple. Philippines. Rev. Hort. 1886, p. 396.
- *vestalis*. White. Philippines. 1882.

- P. speciosa*. White, rose-madder, yellow. 1881. Tropical Asia.
 — *Christiana*. Rose-madder, white. 1882.
 — *impe'ratric*. Rose-purple. 1882.
 — *Stobartiana*. Green, amethyst, yellow, white. 1877.
 — *Stuartiana*. Cream, sulphur, cinnamon, white. January. Philippines. 1881. B. M. t. 6222.
 — *bella*. Cream, red, purple-brown. G. C. 1888, iii. p. 200.
 — *Hrubiana*. Purple, white. 1884.
 — *no'bilis*. Cream, orange. 1882.
 — *punctatissima*. White, greenish, carmine, yellow, mauve. 1882.
 — *punctulata*. Sepals and petals dotted with red. Lind. t. 8.
 — *sumatran*. White, brown. Sumatra. 1865. B. M. t. 5527.
 — *Kimballiana*. Yellow, red, ochre, orange. G. C. 1888, iv. p. 6.
 — *parucivittata*. A form with fewer streaks than in the type. 1882.
 — *sanguinea*. Dark red, yellowish-green. Borneo. 1881.
 — *tetra spits*. White, yellow. Andaman Islands. G. C. 1881, xv. p. 562.
 — *Valentini*. Purple, white, mauve, yellow. 1883.
 — *Veitchiana*. Purplish, with dark-purple spots. Philippines. 1872.
 — *brachyodon*. White, brown, purple. 1884.
 — *violacea*. Rose-purple, white, yellow. Sumatra. 1861. G. C. 1881, xvi. p. 145.
 — *Bowringiana*. Light yellow, purple. Malayan Archipelago. 1884.
 — *Murtoniana*. Lemon-yellow, purplish. Malacca. 1878.
 — *Schröderi*. Purple, amethyst. G. C. 1882, xviii. p. 242.
 — *Wightii*. White, purple. Burmah. 1865. Now referred to *DORITIS*.

Phala'ngium. (From *phalagion*, a spider. Nat. ord., *Liliaceæ*.) A synonym of **Anthericum**.

- P. argenteo-lineare*. See *Anthericum variegatum*.
 — *elatum*. See *Chlorophytum elatum*.
 — *Liliago*. B. M. t. 914. See *Anthericum Liliago*.
 — *Liliastrum*. Red. Lil. t. 255. See *Paradisea Liliastrum*.
 — *nepalense*. B. R. t. 998. A synonym of *Chlorophytum nepalense*.
 — *pomeridianum*. Swt. Fl. Gard. ser. 2, t. 381. A synonym of *Chlorogalum pomeridianum*.
 — *ramosum*. B. M. t. 1055. See *Anthericum ramosum*.
 — *virgatum*. See *Nolina georgiana*.

Phalaris. Canary Grass. (From *phaloros*, shining; referring to the shining seeds. Nat. ord., *Gramineæ*; Tribe, *Phalarideæ*.)

- P. canariensis* produces the Canary-seeds of commerce. Seeds; common soil.
 — *appendiculata*. See *P. paradoxa*.
 — *arundinacea*. 3-5. Purplish. July. Britain. Syn., *Digraphis arundinacea*. Eng. Bot. ed. 3, t. 1697.
 — *gigantea*. A robust form. France. 1877.
 — *variegata*. Leaves striped. Ribbon Grass or Gardener's Garters.
 — *canariensis*. 2. July. Britain. Eng. Bot. ed. 3, t. 1698.
 — *cærulea*. 1. June. Italy. 1823. Syn., *P. commutata*.
 — *paradoxa*. 1. June. Egypt. 1820. Syn., *P. appendiculata*.

Phaleria. (Derivation unexplained, perhaps from *phaleros*, white; in allusion to the white flowers. Nat. ord., *Thymelæaceæ*; Tribe, *Phalericeæ*.)

- Stove evergreen shrub, with very fragrant flowers. Seeds in a hotbed in spring; cuttings of young shoots in sand, under a bell-glass, in bottom-heat. Rich light loam and fibry peat. Summer temp., 60° to 85°; winter, 58° to 70°.
 — *laurifolia*. 6. White. Ceylon. 1869.

Phaleroce'rpus. (From *phaleros*, white, and *karpos*, fruit. Nat. ord., *Vacciniaceæ*.)

Hardy evergreen creeper. For culture, see GAULTHERIA.

- P. hispidulus*. White. April. N. America. 1815. Syn., *P. serpyllifolia*, *Chiogenes hispida*, and *Gaultheria serpyllifolia*.

Phalocallis. (From *phalos*, a cone, *kallos*, beautiful; beautifully conecrested. Nat. ord., *Iridææ*; Tribe, *Morçææ*.) A synonym of **Cypella**.

- P. plumbea*. B. M. t. 3710. A synonym of *Cypella plumbea*.

Pharbitis. (From *pharbe*, colour; deep and varied colours of the flowers. Nat. ord., *Convolvulaceæ*.) A synonym of **Ipomœa**.

- P. barbat*. A synonym of *Ipomœa hederacea*.
 — *barbifera*. Blue. September. N. America. A synonym of *Lettsomia barbifera*.
 — *cathartica*. Blue, purple. September. Mexico. 1848. A synonym of *Ipomœa cathartica*. Stove.
 — *cœrulea*. Pale blue. July. E. Indies. 1820. Hardy.
 — *cuspidata* and *Dille'ni* are synonyms of *Ipomœa longicauspis*.
 — *diversifolia*. A synonym of *Ipomœa hederacea*.
 — *hedera'cea*. See *Ipomœa hederacea*.
 — *hispida*. See *Ipomœa purpurea*.
 — *Lea'rit*. B. R. 1841, t. 56. See *Ipomœa Lea'rit*.
 — *n'l*. See *Ipomœa hederacea*.
 — *ostrina*. 20. Purple. July. Cuba. 1840. Stove. B. M. 1842, t. 51.
 — *punctata*. See *Ipomœa hederacea*.
 — *sca'bra*. White. September. 1823.
 — *triloba*. A synonym of *Ipomœa hederacea*.
 — *tyrianthina*. B. M. t. 4024. See *Ipomœa tyrianthina*.
 — *varia*. Blue, violet. September. 1816. Stove.

Pharium. (From *pharos*, a covering. Nat. ord., *Liliaceæ*; Tribe, *Alliceæ*.) See **Bessera**.

- P. fistulosum*. B. R. t. 1546. See *Bessera fistulosa*.

Pharanceum. (Named after *Pharances*, king of Pontus. Nat. ord., *Ficoidææ*; Tribe, *Molluginææ*.)

- Greenhouse dwarf perennial half-shrubby plants with fleshy leaves, which have an agreeable acid flavour and may be used for salad. Seeds and cuttings. Light sandy soil, and not too much water; it requires no shade. Summer temp., 60° to 80°; winter, 50° to 60°.

- P. ac'idum*. White. St. Helena. 1869. Ref. Bot. t. 153.
 — *incanum*. Greenish, white; stigmas crimson. large. Summer. S. Africa 1782. B. M. t. 1883.

- P. lineare*. 1-2. White. S. Africa. 1800.
Andr. Rep. t. 329. The form figured in
Andr. Rep. t. 326 is *P. reflexum*.
— *reflexum*. 1. Yellowish. July. S. Africa.
1802. Syn., *P. lineare* of Andr. Rep.
t. 326.

Pharus. (From *pharos*, a covering ;
the leaves being used for thatching and
similar purposes. Nat. ord., *Gramineæ* ;
Tribe, *Panicææ*.)

- A stove grass. For cultivation, see BAMBUSA.
P. latifolius. Green. Jamaica. 1796.
— *vittatus*. Leaves striped with white.
1848. Syn., *P. vittatus*. Fl. Ser. t. 316.

Phaseolus. Kidney Bean. (From
phaselus, a little boat ; fancied resem-
blance of the pods. Nat. ord., *Legu-
minosæ* ; Tribe, *Phaseolææ*.)

For culture of annuals, see KIDNEY BEANS ;
perennials, by division and cuttings, and usual
greenhouse or stove culture.

STOVE DECIDUOUS TWINERS.

- P. Caracalla*. 1½. Lilac. August. India. 1690.
— *derasus*. Greenish-white. Brazil. 1888.
— *lobatus*. 6. Yellow. September. Buenos
Ayres. 1843. Evergreen. B. M. t. 4076.
— *speciosus*. 6. Scarlet. July. Orinoco. 1820.

GREENHOUSE DECIDUOUS TWINER.

- P. sylvestris*. 6. Scarlet. July. Mexico. 1825.

HARDY DECIDUOUS TWINERS.

- P. multiflorus*. 12. Scarlet. July. S. Amer.
1633.
— *albiflorus*. 12. White. August. S.
Amer. 1633.
— *perennis*. 3. Dark purple. July. Carolina.

Phaylo'psis. (From *phaios*, dusky,
hule, wood, and *opsis*, like. Nat. ord.,
Acanthaceæ ; Tribe, *Ruellieææ*.)

- Stove perennial. Sandy loam. Seeds.
P. longifolia. Green. March. Sierra Leone.
1822. B. M. t. 2433.

Pheasant's Eye Adonis. *Adonis
autumnalis*.

Phebalium. (From *phibale*, a
myrtle ; the appearance of the plants.
Nat. ord., *Rutaceæ* ; Tribe, *Boronieææ*.
Allied to *Crocea* and *Eriostemon*.)

Greenhouse evergreen, yellow-flowered, Aus-
tralian shrubs. Cuttings of half-ripened shoots
or short, stumpy side-shoots, in sand, under
a bell-glass, in May ; sandy peat, with a small
portion of fibry loam. Winter temp., 38° to
48°.

- P. aureum*. See *P. squamulosum*.
— *Billardierei*. 10. May. 1825. Syn., *P.
elatrum*.
— *lachnoides*. 3. May. 1824.
— *lineare*. 3. June. 1825.
— *salicifolium*. 3. June. 1825.
— *squamulosum*. 2½. May. 1824. Syn., *P.
aureum*.

Phego'pteris. (From *phegos*, the
beech tree, and *pteris*, a fern ; one
species brought from Polypodium,
namely, *P. vulgare*, being called the
beech-fern. Nat. ord., *Filices*—*Polypo-
diaceæ*.) See also **Polypodium**.

Brown-spored ferns. For cultivation, see
FERNs.

GREENHOUSE.

- P. rugulosum*. Tasmania.

STOVE.

- P. a'mpla*. Tropical America.
— *aurea*. 2. E. Indies.
— *decussata*. 5. W. Indies.
— *divergens*. 5. Tropical America.
— *effusa*. 5. W. Indies. 1769.
— *formosa*. 4. Brazil.
— *hastifolia*. Jamaica.
— *lachnoides*. 4. Jamaica. 1841.
— *macroptera*. Brazil.
— *molliscula*.
— *spectabilis*. Tropical America.
— *submarginata*. Brazil.
— *trichoides*. Malay Archipelago.

In addition to the foregoing, *Polypodium al-
pestre*, *calcareum*, *Dryopteris flexile*, *vulgare*,
drepanum, and *hexagonopterum*, have been in-
corporated in this genus.

Phelipæ'a. (Commemorative of the
Phelipeææ family, patrons of the bo-
tanist Tournefort. Nat. ord., *Orobanch-
aceææ*.)

A very singular and beautiful genus, of which
few species have yet been successfully cultivated.
P. foliata is a hardy annual, parasitical upon the
roots of *CENTAUREA dealbata*. The seeds should
be sown with those of the *CENTAUREA*, together,
in the same pot, when probably some will ger-
minate, fasten themselves upon the roots of
the seedling *CENTAUREAS*, and develop into
plants.

- P. foliata*. 3. Red. Caucasus. 1880. The
leaves, as in the rest of the order *Oro-
banchaceææ*, are reduced to coloured
scales, never green. Syn., *Anoplanthus
Bierbersteini* and *A. foliata*.

Phenakospermum. (From *phe-
nakisma*, deception, and *sperma*, a seed ;
the seed is upon a large orange-coloured
aril. Nat. ord., *Scitamineææ* ; Tribe,
Museææ.) See **Ravenala**.

- P. guianense*. Ill. Hort. 1860, p. 239. See *Ra-
venala guianense*.

Philade'lyphus. Syringa, or Mock
Orange. (Athenian name for a shrub.
Nat. ord., *Saxifrageææ* ; Tribe, *Hydran-
geææ*. Allied to *Deutzia*.)

Hardy deciduous, fragrant, white-flowered
shrubs. Layers and suckers, and dividing the

plant in spring; common soil; deep loam is best. Many of the species would present a beautiful appearance if grown as single dwarf specimen trees, with a clean stem.

Philage'ria. (From *Philesia* and *Lagereria*. Nat. ord., *Liliaceae*; Tribe, *Luzuriagae*.)

A greenhouse evergreen shrub, probably hardy in the south of England; produced as a hybrid between *Philesia buxifolia* and *Lagereria rosea*. Peat. Divisions; layers.

- P. Veitchii*. Rose-purple, bright rose. 1872. G. C. 1872, p. 358.

Phile'sia. (From *philesios*, lovely. Nat. ord., *Liliaceae*; Tribe, *Luzuriagae*. Allied to *Lagereria*.)

This is an evergreen, greenhouse shrub. Prune after it has bloomed early in the summer. Propagated by cuttings. Peat and loam in equal proportions; requires to be kept moist.

- P. buxifolia*. 3. Pink. June. Valdivia. 1853. B. M. t. 4738.

Philibe'rtia. (Named of *J. C. Philibert*, a botanical author. Nat. ord., *Asclepiadaceae*; Tribe, *Cynancheae*. Allied to *Pergularia*.)

Stem, yellowish-white-flowered, evergreen twines. Cuttings of firm side-shoots in sand, under a bell-glass, in May, and kept in a cold pit until struck; sandy loam and fibry peat, well-drained. Winter temp., 40° to 45°; summer, 60° to 75°.

- P. campanulata*. 6. Yellow, brown. September. Peru. 1844. Syn., *Sarcostemma campanulata*. B. R. 1846, t. 36.

- P. gracilis*. 6. June. Buenos Ayres. 1836.
— *grandiflora*. June. Buenos Ayres. 1836. B. M. t. 3618.

Philly'rea. (From *phyllon*, a leaf; literally, a leafy plant, the flowers being inconspicuous. Nat. ord., *Oleaceae*; Tribe, *Oleineae*.)

Of all our hardy evergreens the Phillyrea is the best adapted for growing as dwarf standards. All white-flowered, and natives of South of Europe. Layers in autumn; cuttings under a hand-light; seeds, after being mixed with soil in the rot-heap; good, common garden-soil.

Philo'gyne. A synonym of *Narcissus*.

Philopo'dium ri'gidum. A synonym of *Muehlenbeckia adpressa*.

Philothe'ca. (From *philos*, smooth, and *theke*, a sheath; smooth tube of stamens. Nat. ord., *Rutaceæ*; Tribe, *Boroniææ*. Allied to *Crowea*.)

Greenhouse evergreen shrub. Cuttings of short young shoots, a little firm at the base, in sand, under a bell-glass, and placed in a cold frame in May; sandy loam and fibry peat. Winter temp., 40° to 45°.

P. austr'alis. 2. Pale red. April. N. S. Wales. 1822.

Phily'drum. (From *phileo*, to love,

and *hydor*, water. Nat. ord., *Phylodra-ceæ*.)

Greenhouse biennial. Seeds in spring, in a warm place, and moved to a colder when up; sandy loam and peat; does best in the greenhouse.

P. glaberrimum. See *Helmholtzia glaberrima*.

— *lanuginosum*. 3. Yellow. June. China. 1801.

Phinæ'a. (An anagram of *Niphæa*. Nat. ord., *Gesneraceæ*; Tribe, *Gesnerææ*.)

Stove herbs. For culture, see *NIPHÆA*, to which this genus is closely allied.

P. albo-linea'ta. ‡. White. September. New Grenada. 1844. Syn., *Niphæa albo-lineata*. B. M. t. 4282.

— *reticulata*. Leaves with coloured veins. Syn., *Niphæa albo-lineata*, var. *reticulata*. B. M. t. 5043.

Phlox. (From *phlox*, flame; brilliancy of the flowers. Nat. ord., *Polemoniaceæ*.)

Herbaceous perennials, natives of North America, except where otherwise mentioned. Divisions, seeds, and cuttings under a hand-light, in a shady place, in summer; sandy loam and leaf-mould; the low trailing ones are beautiful on knolls and rock-works. *Drummondii* by seed sown the first week in April, in the open air.

Pho'r'bia cepeto'rum. The Onion Fly. Syns., *Anthomy'ia cepa'rum* and *Scato'phaga cepa'rum*. The onion is liable to attack by the grub or larva of this fly, especially when grown in light soils. The gardener who sees his young onions, when about the thickness of a

straw, turning yellow, and the leaves sunk down upon the ground, may at once know that they are the victims of this insect. Even when of larger growth the onion is still liable to suffer from its attacks, and even up to the time of the bulb's full growth. If the outer coats of a young onion thus destroyed are stripped off, the grub is at once detected; but if the onion is older, the grubs are often numerous. In both cases they will be found feeding on the very heart of the onion. The grub varies from about a quarter to half an inch long, is fleshy, shining, whitish, cylindrical, tapering from the head to the tail, and divided into twelve segments. The pores through which it breathes are yellow, and in the first segment. In about three weeks from the time of being hatched it changes into a chestnut-coloured, oval puparium, or case, within which is the real pupa. From this, in about a fortnight, the perfect fly comes forth, of the size of the cross lines, and appearing as magnified in our drawing. This is the female, and

is entirely of a pale, ashy colour, covered with black bristles. The male has a black line down the middle of the abdomen. The antennæ and legs are black; the wings are transparent, almost colourless, but iridescent pink and green. The female inserts her eggs within the leaf-sheaths of the onion, close to the ground. She continues to lay her eggs from May to September, producing several broods during that period. The latest brood remains in the pupa state through the winter, so that all old-decaying store-onions should be burnt up as spring advances. The best preventive of this grub is to sprinkle gaslime between the rows of seeding-onions, its fumes being offensive to the fly. It may be well, also, to try spreading powdered charcoal among them in a similar way, for the fly is said to deposit her eggs in this powder as readily as in the onion-plants. Another easy method is to trench the ground rather deeply in winter and so bury the pupæ at such a

depth as to render it impossible for the flies to come to the surface the succeeding spring.

Pho'rmium. Flax Lily, or New Zealand Flax. (From *phormos*, a basket; one of the uses made of the fibre. Nat. ord., *Liliaceæ*; Tribe, *Hemerocallæ*.)

Half-hardy perennials. Divisions of the root; imported seeds; rich, mellow loam.

P. alpi'num. New Caledonia. 1890.

There are now several varieties of this in cultivation, as *atropurpu'reum*, a dark purple form; *Moorla'ndii*, leaves variegated; *ni'gro-pi'ctum*, leaves edged with dark purple; *Saunder'sii*, a dwarf form; *Veitchia'num*, leaves short and narrow.

Photi'nia. (From *photeinos*, shining; appearance of the leaves. Nat. ord., *Rosaceæ*; Tribe, *Pomeæ*. Syn., *Eriobotrya*.)

Half-hardy white-flowered evergreens. Seeds when procurable, treated as the haws of the Hawthorn; generally by budding on the Hawthorn as a stock; rather tender for the open air north of London, but deserve a wall, owing to their beautiful foliage; and where also, when established, they would generally flower freely.

Phycea'lla. (A diminutive of *phycos*, Red Alkanet; alluding to the colour of the flowers. Nat. ord., *Amaryllidaceæ*; Tribe, *Amaryllææ*.) See **Hippeastrum**.

P. attenuat'a, bi'color, biflo'ra, brevit'u'ba, cyrtanthoi'des, graciliflo'ra, i'gnea and *magnif'ica* are forms of *Hippeastrum bicolor*. — *chlora'cea.* See *Phædranassa chloracea*, B. R. 1845, t. 17.

— *Herbertia'na.* B. R. t. 1341. See *Hippeastrum Herbertianum*.

Phyge'lius. (Derivation unexplained, perhaps from *phyge*, shunning; from its having escaped the observation of botanists for a long time. Nat. ord., *Scrophulariaceæ*; Tribe, *Cheloneæ*.)

Herbaceous perennial, hardy south of London. Readily propagated from seeds, which are produced in abundance, and should be sown in a slight hotbed in spring, and afterwards transplanted to a warm sunny border. May also be propagated by cuttings of ripened shoots, and by division of the plant. Rich light loam.

P. cape'nsis. 3. Scarlet. Summer. Kaffraria. 1855. B. M. t. 4881.

Phylica. (From *phyllikos*, leafy; abundance of evergreen leaves. Nat. ord., *Rhamnaceæ*; Tribe, *Rhamnææ*.)

Greenhouse evergreens, from South Africa, and all white-flowered, unless otherwise mentioned. Cuttings of young shoots in sand, under a glass, in spring, and kept cool and shaded from sunshine until they have struck; sandy, fibry peat, with nodules of freestone and charcoal. Winter temp., 40° to 45°.

 — *turbida* tus. 2. Green. July. China.

Phylla'rthron. (From *phyllon*, a leaf, and *arthros*, a joint; leaflets as if jointed to the footstalks. Nat. ord., *Bignoniaceae*; Tribe, *Crescentieae*.)

Stove evergreen shrub. Cuttings of stubby side-shoots, or pieces of the ripe young wood, in sand, under a bell-glass, in bottom-heat; sandy loam and fibry peat, and a little leaf-mould and charcoal. Winter temp., 50° to 55°; summer, 60° to 90°.

- P. Bojeria* na. 3. Rose. July. Mauritius. 1844. B. M. t. 4173.

Phyllis. (From *phyllon*, a leaf. Nat. ord., *Rubiaceae*.)

Greenhouse undershrub. Cuttings in sand, under a bell-glass.

- P. No* bia. 3. White. June. Canary Islands and Madeira. 1699.
 — *paucifo* ra. Flowers fewer than in the type.

Phylloca'ctus. (From *phyllon*, a leaf, and *cactus*. Nat. ord., *Cactaceae*.) This genus has been formed from the *Epiphyllum* section of *Cactus*.

For treatment, see CACTUS.

- P. Ackermanni*. Rich crimson. Summer. Mexico. 1829. Syn., *Cactus Ackermanni*, B. R. t. 1331.
 — *albus superbi* ssimus. Yellowish-white. Garden seedling. 1891.
 — *angul* liger. White, brown. October. Mexico. B. M. t. 5100.
 — *biformis*. 2 $\frac{1}{2}$. Pink. Honduras. 1839. B. M. t. 6156. Syns., *Cereus biformis* and *Discocactus biformis*. B. R. 1845, t. 9.
 — *caulorrhi* zus. White, pale green.
 — *crena* tus. Creamy-white. Honduras. 1839. Syn., *Cereus crenatus*. B. R. 1844, t. 31.
 — *cocci* neus. Scarlet.
 — *crue* ntum. Red. Hybrid. Flor. Mag. t. 413
 — *grandifo* rus. Large flowered variety. 1884. Gf. t. 1176.

- P. Hooke'ri*. 3. White. Summer. S. America. Syn., *Cactus Phyllanthus*. B. M. t. 2692.
 — *Jenkins'ni*. Crimson. A hybrid.
 — *latifrons*. 10. Creamy-white. Mexico. Syns., *Cereus latifrons*. B. M. t. 3813, and *C. oxyptelus*.
 — *multiflorus*. Reddish-crimson.
 — *phyllanthoides*. 3. Rose, white. June. 1810. Syns., *Cactus phyllanthoides*. B. M. t. 2092, and *C. speciosus*. B. R. t. 304.
 — *Phyllanthus*. 1-3. White or cream. June. S. America. 1710. Syns., *Cereus Phyllanthus* and *Epiphyllum Phyllanthus*.
 — *speciosissimus*. *crenatus* *Frangi*. Hybrid. Paxt. Fl. Gard. iii. t. 62.

Phyllocl'yx. (From *phyllon*, a leaf, and *kalyx*, a cup; the calyx is leafy. Nat. ord., *Myrtaceæ*.) United with **Eugenia** in the Genera Plantarum.

Stove or greenhouse shrub. For culture, see MYRTUS.

- P. edulis*. 4. White; fruit yellow, with an odour of pine-apple. Brazil. 1884. Rev. Hort. 1884, p. 348.

Phyllocladus. (From *phyllon*, a leaf, and *klados*, a branch; branch-like leafleted leaves. Nat. ord., *Coniferæ*; Tribe, *Taxææ*. Allied to *Podocarpus*.)

Greenhouse cone-bearing trees, from Van Diemen's Land, except *P. hypophylla*. Cuttings of the ripe shoots in sand, under a glass, in spring, and no artificial bottom-heat until the cuttings swell at their base; strong loam. At Belfast, *rhomboidalis* (Celery-topped, or Adventure Bay Pine) bears the winter without protection; *trichomanoides* would be equally hardy in the south of Ireland and south-west of England. Winter temp., 40° to 48°; summer, 60° to 75°.

- P. glauca*. Yellow. 1853.
 — *hypophylla*. 10-30. Borneo.
 — *rhomboidalis*. 40. 1825. Syn., *Podocarpus asplenifolius*.
 — *trichomanoides*. 60. Yellow. July. 1840.

Phyllococe. (From *phyllon*, a leaf, and *dokein*, to shine; the leaves are shiny. Nat. ord., *Ericaceæ*.)

Hardy, heath-like shrubs, requiring a peaty soil. Propagation by layers.

- P. cœrulea*. See *P. taxifolia*.
 — *empetrifolius*. A synonym *Bryanthus empetrifolius*.
 — *taxifolia*. 2. Lilac. May. Britain. Syns., *P. cœrulea* and *Menziesia cœrulea*. B. C. t. 164. Eng. Bot. ed. 3, t. 886.

Phyllo'na. (From *phyllon*, a leaf, and *loma*, a border. Nat. ord., *Liliacæ*; Tribe, *Aloineæ*.) See **Lomatophyllum**.

- P. aloiflorum*. B. M. t. 1585. See **Lomatophyllum borbonicum**.

Phyllostachys. (From *phyllon*, a leaf, and *stachys*, a spike; the spikelets are inclosed in foliaceous bracts. Nat. ord., *Gramineæ*.)

Arborescent grasses. For culture, see BAMBUA. The stems of *P. nigra* form the Whangee Canes of commerce.

- P. bambusoides*. 10. Japan.
 — *nigra*. 5. China and Japan. Syn., *Bambusa nigra*.

Phyllo'ta. (From *phyllon*, a leaf, and *ous* (*otis*), an ear; shape of leaves. Nat. ord., *Leguminosæ*; Tribe, *Podalyriææ*. Allied to *Aotus*.)

Greenhouse evergreen, yellow-flowered shrub. Cuttings of young shoots getting firm (the little stubby side-shoots are best), in spring and summer, in sand, under a bell-glass; fibry, sandy peat, and a few nodules of fibry loam, to keep the plants stubby. Winter temp., 40° to 48°.

- P. phyllicoïdes*. 2. Yellow. May. New South Wales. 1824. Syns., *P. aspera*, *P. comosa* and *P. squarrosa*.

Phyllotæ'nium. See **Xanthosoma**.

Phyllo'xera vasta'trix. See **Grape Phylloxera**.

Phymata'nthus. (From *phuma*, a tumour, and *anthos*, a flower. Nat. ord., *Geraniaceæ*.) See **Pelargonium**.

- P. elatius*. Swt. Ger. t. 96. A synonym of *Pelargonium elatum*.
 — *tricolor*. Swt. Ger. t. 43. A synonym of *Pelargonium tricolor*.

Phymato'des. (From *phuma*, a swelling; alluding to the thickened base of the fronds. Nat. ord., *Filices*—*Polypodiaceæ*.) A sub-genus of **Polypodium**.

Stove ferns. See **FERNS**.

- P. bifrons*. 1. Ecuador.
 — *Billardie'ri*. 1½. New Zealand.
 — *excavata*. 1. E. Indies.
 — *geminata*. 1. Brazil.
 — *leiorhiza*. E. Indies. 1844.
 — *longifolia*. Malay Archipelago.
 — *longipes*. 3. Malay Archipelago. 1823.
 — *longissima*. Malay Archipelago.
 — *nigræscens*. 3. Java. 1857.
 — *ni'da*. E. Indies.
 — *pellida*. 1½. E. Indies.
 — *pustulata*. 1½. New Zealand. 1820.
 — *sinuosa*. Java. 1859.
 — *terminalis*. 1. E. Indies.
 — *vulgaris*. E. Indies. 1823.

Phy'salis. (From *physa*, a bladder; alluding to the calyx. Nat. ord., *Solanaceæ*; Tribe, *Solanææ*.)

There are many species of this genus, but only the following are worth cultivating. They are herbaceous perennials; the first is hardy, the others are only half-hardy.

- P. Alkeke'ngi*. 1. White. July. S. Europe. 1548. Winter Cherry. Sibth. Fl. Gr. t. 234.
 — *edulis*. B. M. t. 1068. See *P. peruviana*, var. *edulis*.
 — *peruviana*. 3. Whittish; anthers violet. Fruit purplish. July. S. America. 1772.
 — *edulis*. 2. Yellow. Fruit yellow. July. S. America. 1773.—Cape Gooseberry. Syn., *P. edulis*.
 — *violacea*. 3. Yellow, purple. Fruit dark violet. Mexico. 1833. Syn., *P. violacea*.
 — *prostrata*. Aodr. Rep. t. 75. Now referred to CACABUS.
 — *Schradærid'na*. 1. White, with olive-green dots. Summer. Mexico, 1838.
 — *violacea*. Rev. Hort. 1832, p. 216. See *P. peruviana*, var. *violacea*.

Physia'nthus. (From *physa*, a bladder, and *anthos*, a flower; alluding to its shape. Nat. ord., *Asclepiadaceæ*.) See **Arauja**.

P. albens. B. M. t. 3201. See *Arauja sericifera*.
— *auricomus.* B. M. t. 3391. See *Arauja graveolens*.

Physic Nut. *Ja'tropha*.

Physidium. (From *physa*, a bladder, and *eidōs*, like; the lip of the flower is inflated. Nat. ord., *Scrophulariaceæ*.) A synonym of **Angelonia**.

P. cornigera. See *Angelonia cornigera*.
— *Gardneri.* See *Angelonia Gardneri*.

Physochlaina. (From *physa*, a bladder, and *chlaina*, an outer garment; referring to the swollen calyx of some species. Nat. ord., *Solanaceæ*; Tribe, *Hyoscyameæ*.)

Hardy herbaceous perennials. Common garden-soil. Increased by root division in autumn or early spring.

P. grandiflora. 1½. Green. May. Thibet. 1850. B. M. t. 4600.
— *orientalis.* 1½. Bluish-purple. March. Armenia. 1821. Syn., *Hyoscyamus orientalis*. B. M. t. 2414.
— *physalodes.* 1½. Violet-purple. March. Siberia. 1777. Syn., *Hyoscyamus physaloides*. B. M. t. 852.

Physosiphon. (From *physao*, to inflate, and *siphon*, a tube; because the tube of the flower is slightly inflated. Nat. ord., *Orchideæ*; Tribe, *Epidendrea-Pleurothalleæ*. Allied to *Stelis*.)

Stove epiphytcal orchids. For cultivation, see **PLEUROTHALLIS**.

P. guatemalensis. Yellow, purple. Guatemala. 1891.
— *Lodigesi.* Yellowish-green, red-orange. March. Mexico. 1828. Syn., *Stelis tubata*. B. C. t. 1601.
— *punctulatus.* Greenish-yellow, purple. Bogota. 1870.

Physostegia. (From *physa*, a bladder, and *stegē*, a covering; formation of the calyx. Nat. ord., *Labiatae*; Tribe, *Stachydeæ*. Allied to *Melittis*.)

Hardy herbaceous perennials. Seeds in a little heat, early, and then most of the plants when turned out in May will bloom the same season; divisions of the plants in spring; and cuttings, or young shoots, under a hand-light, in sandy soil, in summer; sandy loam and a little leaf-mould.

P. cordata. Purple. July. N. Amer. 1824.
— *denticulata.* See *P. virginiana*, var. *denticulata*.
— *imbricata.* 3. Pale purple. September. Texas. 1833. B. M. t. 3336.
— *intermedia.* 1-3. Purplish. Summer.
— *speciosa.* See *P. virginiana*, var. *speciosa*.
— *truncata.* 1½. Pale pink. St. Felipe. 1834.
— *variegata.* See *P. virginiana*.
— *virginiana.* 1½. Red. August. N. Amer. 1683. Syns., *P. variegata* and *Dracocephalum virginianum*. B. M. t. 467.
— ——— 3. White. August.
— *denticulata.* Striped. August. Carolina. 1787. Syns., *P. denticulata* and

Dracocephalum denticulatum, B. M. t. 214.

P. virginiana speciosa. Pink. July. 1822. Syns., *P. speciosa* and *Dracocephalum speciosum*. Swt. Fl. Gard. t. 93.

Physostelma. (From *physa*, a bladder, and *stelma*, a girdle; in allusion to the corona. Nat. ord., *Asclepiadaceæ*; Tribe, *Marsdeniæ*.)

Climbing, stove shrub. For culture, see **HOYA**.

P. campanulatum. See *P. Wallichii*.
— *Wallichii.* Green, yellow. May. Malay Archipelago. 1845. Syns., *P. campanulatum* and *Hoya campanulata*. B. M. t. 4545.

Physostigma. (From *physa*, a bladder, and *stigma*; the stigma is furnished with a hood-like appendage. Nat. ord., *Leguminosæ*.)

Climbing, stove herb. The only species, *P. venosum*, is the Ordeal Bean of Old Calabar.

P. venosum. Purplish. Tropical Africa. Bent. and Tr. t. 80.

Physurus. (From *physa*, a bladder, and *oura*, a tail. Nat. ord., *Orchideæ*; Tribe, *Neottieæ*—*Spirantheæ*. Allied to *Anæctochilus*.)

P. pictus rivals the far-famed *Anæctochilus* in the richness of its foliage. Stove orchids, in pots. Division in spring. See **ORCHIDS**.

P. argenteus. ½. White. June. Ceylon. Syn., *Anæctochilus argenteus*.
— *decorus.* Whitish. Sumatra. 1873.
— *umbrellaris.* White, yellow. Brazil.
— *Lobbianus.* ½. Java. 1847.
— *maculatus.* Leaves green, dotted with white. Guayaquil. 1862. B. M. t. 5305.
— *nobilis.* Leaves dark-green, silvery veined. Brazil. 1865.
— *Ortiesii.* White. Columbia. 1873. Syn., *Anæctochilus Ortiesii*.
— *pictus.* ½. White. June. Brazil. 1844. Syns., *Anæctochilus argenteus*, var. *pictus*, *A. pictus* and *Microchilus pictus*.
— *Preslei.* Yellow. February. Maraquitá, Peru.
— *querceticolus.* N. America. Syn., *Anæctochilus querceticolus*.
— *rariflorus.* Yellow. March. Caraccas.

Phytarhi'za. See **Tillandsia**.

Phytelephas. (From *phyton*, a plant, and *elephas*, ivory; alluding to the seed, which, under the name of Ivory nut, is largely imported and used by turners in forming small ivory-like toys, buttons, etc. Nat. ord., *Palmeæ*; Tribe, *Areceæ*.)

Stove evergreen tree. Imported seeds. Sandy loam and leaf-mould. Summer temp., 65° to 85°; winter, 50° to 60°.

P. macrocarpa. 18. New Grenada. 1846.— Ivory-nut Palm. Fl. Ser. tt. 496-497.

Phyteuma. Rampion. (An ancient name of a plant. Nat. ord., *Campanulaceæ*; Tribe, *Campanuleæ*. Allied to *Campanula*.)

Hardy herbaceous perennials, with two exceptions. Seeds and divisions in spring; common light garden-soil. Pretty little things for rock works and the front of borders.

- P. betonicæfolium*. 2. Pale blue. June. South Europe. 1818. *P. betonicæfolium* of B. M. t. 2066 is *P. Michelii*.
- *campanuloides*. 1. Blue. July. Caucasus. 1804. B. M. t. 1015.
- — *Sibthorpiænum*. July. Mount Olympus. 1804.
- *canescens*. 2. Lilac. July. Hungary. 1804.
- *Charméii*. 1. Blue. June. Pyrenees. 1823.
- *comosum*. $\frac{1}{2}$. Blue. June. Austria. 1752. Biennial. B. M. t. 6478.
- *cordatum*. B. M. t. 1466. See *P. orbiculare*.
- *globularifolium*. $\frac{1}{2}$. Blue. June. South of France. 1820.
- *Halle'ri*. $\frac{1}{2}$. Violet. May. South of France. 1822.
- *hemisphæricum*. 1. Blue. July. Switzerland. 1752. Jacq. Ic. t. 333.
- *hispidum*. 1. Blue. June. Switzerland. 1825.
- *hu'mile*. $\frac{1}{2}$. Blue. June. Switzerland. 1825.

- *lancoletum*. $\frac{1}{2}$. White. June. Armenia. 1826.
- *limoniifolium*. Switzerland. 1832. Evergreen. Sibth. Fl. Gr. t. 218. Syns., *P. strictum* and *P. virgatum*.
- *Miché'ii*. $\frac{1}{2}$. Red. June. Switzerland. 1822. Syn. *P. betonicæfolium* of B. M. t. 2066.
- *nigrum*. $\frac{1}{2}$. Red. July. Bohemia. 1820.
- *orbiculare*. 1. Violet. July. England. B. C. t. 122.
- *decipiens*. Blue. July. Switzerland. 1819.
- — *gigantæum*. Blue. July. France. 1817.
- *parviflorum*. $\frac{1}{2}$. Blue. May. Switzerland. 1823.
- *pulchellum*. 1836.
- *Scheuchzeri*. $\frac{1}{2}$. Blue. May. Switzerland. 1813. B. M. t. 2271.
- *scorzonerifolium*. 1. Blue. July. Alps. 1819.
- *sibiricum*. 1. Blue. July. Siberia. 1817.
- *Sieberii*. 1. Blue. June. Pyrenees. 1826.
- *spicatum*. 2. Blue. May. Europe. 1597. B. M. t. 2347.
- *strictum*, B. M. t. 2145, and *virgatum*, B. C. t. 667. See *P. limoniifolium*.

Phytolacca. (From *phyton*, a plant, and *lacca*, lac; or the crimson colour of the fruit. Nat. ord., *Phytolaccaceæ*; Tribe, *Euphytolaccæ*.)

There are many tender species, but the following hardy herbaceous ones are all that are deserving notice. Seeds and divisions in spring; light, sandy soil and leaf-mould.

- P. acinosa*. North India. 1844.
- *decandra*. 5. White, green. August. S. Amer. 1768. Virginian Poke.
- — *albovariegata*. Garden variety. Rev. Hort. 1837, p. 16, fig. 2.
- *icosandra*. 2. Green. July. Mexico.
- *purpurea*. See *Ledenbergia roseo-ænea*.

Phytomyza ilicis. See **Holly-leaf fly.**

Piara'nthus. (From *piar*, fatness, and *anthos*, a flower; the flowers being succulent, as in *Stapelia*. Nat. ord., *Asclepiadaceæ*; Tribe, *Stapelieæ*.)

Greenhouse evergreens, from South Africa. Cuttings, dried some days at their base before inserting them in sandy loam; sandy loam, lime-rubbish, leaf-mould, and a little dried cow-dung. Winter temp., 48° to 55°; summer, 60° to 90°; dry in winter.

- P. aridus*. $\frac{1}{2}$. Pale yellow. August. 1795.

- P. geminatus*. Orange-yellow, blood-red. Summer. 1796. Syn., *Podanthes geminata* and *Stapelia geminata*. B. M. t. 1326.
- *Gussoneanus*. $\frac{1}{2}$. Yellow, brown. June. 1832.
- *incarnatus*. 1. Flesh. June. 1793. A synonym of *Boucerosia incarnata*.
- *mammillaris*. Brown. June. 1774. A synonym of *Boucerosia mammillaris*.
- *parviflorus*. $\frac{1}{2}$. Yellow. August. 1796.
- *pu'llus*. $\frac{1}{2}$. Dark purple. August. 1774.
- *punctatus*. $\frac{1}{2}$. Dark purple. August. 1795.

Picea. Silver Fir. (From *pix*, pitch; a resin-bearing genus. Nat. ord., *Coniferæ*.)

Hardy, evergreen trees, requiring the same culture as *ABIES*, which see.

- P. ajanensis*. 80. Japan. 1861. B. M. t. 6743. Syn., *P. jezoensis*.
- — *microsperma*. Japan. 1861. Syn., *Abies microsperma*.
- *alba*. 40. Canada. 1700. Fl. Ser. t. 2251. White Spruce.
- *Alcockiana*. 120. Japan. 1861.
- *alpestris*. Swiss Alps. 1887. A variety of *P. excelsa*.
- *Breweria*. 90. N. California. G. C. 1886, xxv. p. 497, fig. 93.
- *canadensis*. See *Tsuga canadensis*.
- — *microphylla*. See *Tsuga canadensis*, var. *microphylla*.
- *communis*. See *P. excelsa*.
- *concolor*. A synonym of *Abies concolor*.
- *Engelmanni*. 100. Rocky Mountains. 1864. Syn., *Abies Engelmanni*.
- — *glauca*. Leaves silvery.
- *eremita*. See *P. excelsa*, var. *eremita*.
- *excelsa*. 150. May. N. Europe. 1548. Syns., *P. communis*, *Abies excelsa*, *A. Picea* and *Pinus excelsa*. Norway Spruce Fir.
- — *attenuata*. A slender variety. Syn., *P. excelsa*, var. *tenuifolia*.
- — *au'rea*. Leaves tipped with gold.
- *capitata*. Garden variety with a more or less globular head. Rev. Hort. 1889, p. 393, fig. 103.
- — *Cianbrasiliana*. 4. There is a form *stricta*.
- — *e'legans*. 6. Compact.
- *eremita*. Bark reddish. Syns., *P. eremita*, *P. miniata*, *Abies eremita* and *A. miniata*.
- — *Finedone*. Young shoots pale yellow, changing with age through bronze to green.
- — *Grego'ryi*. Dense bush.
- — *horizontalis*. Branches more or less horizontal.
- — *inve'rsa*. Branches drooping.
- — *monstro'sa*. Branches straggling, but little branched. Syn., *P. excelsa*, var. *virgata*. Gfl. 1887, p. 321, fig. 128.
- — *na'na*. See *P. excelsa*, var. *pygmaea*.
- — *pu'mila glauca*. Dwarf, spreading.
- — *pygmaea*. 1. Pyramidal. Syn., *P. excelsa*, var. *nana*.
- — *pyramidalis*. Dwarf, pyramidal.
- — *re'sta*. Branches pendulous. Garden variety. Rev. Hort. 1890, p. 259, fig. 73.
- — *tenuifo'lia*. See *P. excelsa*, var. *attenuata*.
- — *variegata*. Variegated with yellow.
- — *virgata*. See *P. excelsa*, var. *monstro'sa*.
- *Gle'hni*. Dwarf. Japan. 1880.
- *jezoensis*. See *P. ajanensis*.
- *Maximowiczii*. Japan. 1880.
- *Menzie'ri*. See *P. sitchensis*.

- P. nigr*. 80. N. America. 1700. Black Spruce.
 — *obovata*. Siberia. Syn., *Abies obovata*.
 — *japonica*. Japan. 1868.
 — *Omorika*. Servia. 1884. The Servian Pine.
 — *orientalis*. 80. Taurus. 1825. Syn., *Abies orientalis* and *Pinus orientalis*.
 — *na'na*. Dwarf, pyramidal. Garden variety. 1891.
 — *Parryana*. See *P. pungens*.
 — *polita*. 50. Japan. Syns., *Abies polita* and *Pinus polita*.
 — *pungens*. A tall tree. Rocky Mountain. Blue Spruce. Syn., *P. Parryana*.
 — *argentea*. Silvery. Syn., *P. Parryana*, var. *glauca*.
 — *rubra*. 50. N. America. 1755. Syns., *Abies rubra* and *Pinus rubra*.
 — *arctica*. Syns., *Abies rubra*, var. *arctica* and *Pinus rubra*, var. *arctica*.
 — *violacea*. Syns., *Abies rubra*, var. *violacea* and *Pinus rubra*, var. *violacea*.
 — *Schrenkiana*. Altai Mountains.
 — *sitchensis*. 70. N. California. 1831. Syns., *P. Menziesii*, *Abies Menziesii*, and *Pinus Menziesii*.
 — *Smithiana*. See *P. Morinda*.
 — *Tsu'ga*. See *Tsuga Sieboldii*.

Pick-axe should have a handle three feet and a half long, made of ash; and the points or edges of the head should be of well-steeled iron. There are three

varieties:—1. The pick with two points, for loosening hard surfaces. 2. The pick-axe, for cutting through roots of trees when felling. 3. The mattock, with one pointed and one flat edge, for loosening surfaces and grubbing up roots.

Picotee. See **Carnation** and **Pink**.

Picridium. (From *Picris*, and *eidōs*, like. Nat. ord., *Compositæ*.)

Hardy, perennial herb. Divisions. Ordinary garden-soil.

P. tingitanum. 1½. Yellow. July. Tangiers. 1882.

Picrorhiza. (From *pikros*, bitter, and *rhiza*, a root; because of its bitter root. Nat. ord., *Scrophulariaceæ*; Tribe, *Digitalæ*.)

Hardy perennial herb. For cultivation, see WULFENIA, to which it is allied. The root is used in native Hindoo medicine.

P. Kurrooa. ½. Green. August. Himalaya. 1880.

Pictetia. (Named after A. Pictet, a physician. Nat. ord., *Leguminosæ*; Tribe, *Hedysaræ*. Allied to *Hedysarum*.)

Stove evergreen, yellow-flowered shrubs, from the West Indies. Cuttings of half-ripened shoots in sand, under a glass, in bottom-heat; peat and loam. Winter temp., 50° to 55°; summer, 60° to 90°.

- P. aristata*. 4. June. Domingo. 1816. Syn., *Æschynomene aristata*.
 — *squamata*. 4. St. Thomas. 1824. Syn., *Robinia squamata*.

Piera'rdia. (Named after Mr. Pierard, of Kew. Nat. ord., *Saxindaceæ*. Allied to *Melicocca*.)

Stove evergreen tree. Cuttings of half-ripe shoots in sandy soil, in heat, in spring; loam and peat. Winter temp., 50° to 55°; summer, 60° to 80°.

P. dulcis. 20. Yellow. Sumatra. 1820. Syn., *P. sapida*.

Pieris. (From *Pieria*, the supposed habitation of the Muses. Nat. ord., *Ericaceæ*.)

Hardy or half-hardy shrubs or trees. For culture, see *ANDROMEDA*.

P. floribunda. 2-6. White. April. United States. 1812. Syns., *Andromeda floribunda*, B. M. t. 1566, and *Leucothoe floribunda*.

— *formosa*. White. G. C. 1881, xv. p. 568, fig. 107.

— *japonica*. White. Japan. G. C. 1882, xvii. p. 796. Syn., *Andromeda japonica*.

— *elegantissima*. Leaves edged with white. Syn., *Andromeda japonica*, var. *variegata*.

— *mariana*. 4. White. May. N. America. 1786. Syn., *Andromeda mariana*, var. *ovalis*. B. M. t. 1759.

— *nivida*. 6. White to reddish-purple. March S. United States. 1765. Syn., *Andromeda coriacea*, B. M. t. 1095.

— *ovalifolia*. 40. Pinkish. May. Nepal. 1825. Half-hardy.

— *densiflora*. White. Assam. 1879.

— *phillyreaefolia*. 2. White. January to March. Florida. 1842. Syn., *Andromeda phillyreaefolia*. B. R. 1844, t. 36.

Pieris cratægi. Hawthorn, or Black-veined Butterfly. Is white, with black ribs or veins on the wings. It is very much like *Pontia brassicæ*. The caterpillar is dirty yellow, hairy, black-headed, and a brown stripe down its sides. The caterpillars moult several times, and they are usually found on the apple-tree, where both the yellow eggs and caterpillars may be found in June. The caterpillars draw two or three leaves together with a web. These should be sedulously sought for and destroyed.

Pigafetta. (After A. Pigafetta, an Italian, who accompanied Magellan's expedition. Nat. ord., *Palmæ*.)

Tall stove palm. For culture, see *METROXYLON*.

P. elata. Celebes. Syns., *Hyospathe elata* and *Metroxylonelatium*.

Pigeon Berry. *Phytolacca decandra*.

Pigeon Pea. *Cajanus indicus*.

Pig Nut. *Carya porcina*.

Pig Root. *Sisyrianchium*.

Pilea. (From *pilos*, a cap; alluding

to one division of the perianth. Nat. ord., *Urticaceæ*; Tribe, *Urticeæ*.)

Small stove herbs, easily increased from seeds, cuttings, or divisions. Rich sandy loam and peat. Summer temp., 60° to 85°; winter, 58° to 70°.

P. microphylla. W. Indies.
— *muscosa*. ½. May. Green. W. Indies. 1793. Syn., *P. serpyllifolia*.—Artillery or Pistol Plant.

Pilea'nthus. (From *pilos*, a cap, and *anthos*, a flower. Nat. ord., *Myrtaceæ*; Tribe, *Chamelauciceæ*. Allied to *Calytrix*.)

Greenhouse evergreen shrub. Cuttings of short young shoots in sand, under a glass, in May, and placed in a shady place in a cold pit; sandy loam and a little peat. Winter temp., 38° to 48°.

P. limacis. 2. April. White. Australia. 1824.

Pilewort. *Ramunculus Fica'ria*.

Pilocar'pus. (From *pilos*, a cap, and *karpos*, fruit; alluding to the shape of the fruit. Nat. ord., *Rutaceæ*; Tribe, *Xanthoxyleæ*.)

Stove shrub. For cultivation, see CHLOROPYLON.

P. pennatifolius. 6. Purple. Brazil.
— *pinnatifidus*. Maroon-red. Brazil. 1868.

Piloce'reus. (From *pilos*, wool, and *Cereus*; alluding to the long hairs upon the spine-cushions. Nat. ord., *Cactaceæ*.)

For cultivation, see CACTUS.

Pilo'gyne. (From *pilos*, wool, and *gyne*, female; the pistil is hairy. Nat. ord., *Cucurbitaceæ*.) See **Zehneria**.

P. punctata. Wien. Gart. Zeit. 1889, p. 459, fig. 73. See *Zehneria scabra*.

Pilula'ria. (From *pilula*, a little ball; referring to the fruit receptacles. Nat. ord., *Marsileaceæ*.)

A small plant with creeping rhizome and filiform leaves, found in low lying meadows in

many parts of England. Of little horticultural value.

P. globulife'ra. ½. Capsules brown. England.

Pilu'mna. (From *pilos* or *pileos*, a cap; shape of flowers. Nat. ord., *Orchideæ*; Tribe, *Vandaceæ*.) See **Trichopilia**.

P. fra'grans. See *Trichopilia fragrans*.

— *la'ca*. See *Trichopilia laxa*.

— *nobilis*. Warn. Orch. Alb. t. 128. See *Trichopilia fragrans*, var. *nobilis*.

Pime'lea. (From *pimele*, fat; referring to the viscid matter on the leaves of some species, Nat. ord., *Thymelaceæ*; Tribe, *Euthymeleæ*.)

Greenhouse evergreen shrubs, from Australia. Seeds sown in a gentle hotbed, in spring; cuttings of young shoots in sand, under a bell-glass; sandy, fibry peat, with a third of fibry loam, and pieces of charcoal, freestone, and broken pots, to keep the soil open, in addition to good drainage. Winter temp., 40° to 48°.

Pinaster. *Pinus pinaster*.

Pincenectitia, *glau'ca* and *P. tuberculata*. See *Beaucarnea stricta* and *B. recurvata*.

Pinching is a term applied to crushing, between the finger and thumb, the leading bud of a shoot, so as to prevent its increasing in length, and to force more sap to the other buds.

Pinckne'ya. (Named after Mr. Pinckney, an American botanist. Nat. ord., *Rubiaceæ*; Tribe, *Condamineæ*. Allied to *Bouvardia*.)

Half-hardy evergreen tree. Seeds; and cuttings of ripened shoots under a hand-light, in sandy peat. It hardly deserves the greenhouse, and is rather tender for exposure, but would probably flourish against a south wall in a shallow border of loam and peat.

- P. pin'bens*, 20. Red. June. Georgia. 1786.

Pine. *Pinus*.

Pine-apples. *Anana'ssa*.

Varieties.—*Queen*: a free grower and an excellent fruiter; fit for the earliest summer fruit, and excellent during September and October. *Ripley Queen*: a very fine fruit, and by many preferred to the first. *St. Vincent*, or *Green Olive*: an excellent winter fruit. *Black Jamaica*: the best winter pine; it is too often confounded with the *Montserrat*. *Black Antigua*: a noble pyramidal fruit, with large pips; should be cut a little before it is quite ripe. *Brown Sugar loaf*: large and showy, with a very juicy flesh; it is said by some to swell tolerably well in winter. *White Providence*: one of the largest and noblest of pines; flavour rather inferior. *Trinidad*: large and of pyramidal shape; flavour not first-rate. *Enville*: noble-looking fruit; flavour second-rate.

Culture.—This usually commences in February. Have the upper thirty inches of the pit in which the pots are to be plunged filled with fresh tan. *Re-pot* your plants, using good strong turfy soil, well chopped to pieces when dry, but by no means riddled. Well made leaf-soil, and a little old dung, and bones, mixed with one-sixth of charcoal—or charred wood, such as will pass readily through a riddle of an inch mesh is also a useful compost.

Use pots which would require but one more shift: the size of the pot for the final shift will determine this; and pots of about thirteen inches diameter will be sufficiently large for any beginner to fruit in. In potting, first place three or four large crocks in such a way as that at least three bold apertures be formed, both for the escape of water and the admission of gaseous matter from below. Over this strew broken crocks and charcoal lumps, large as horse-beans, until the large crocks at the bottom are just concealed. Then strew a layer of the turfy lumps, out of which the loose soil has been ejected by shaking in a riddle. This done, the ball may at once be inserted, first suffering such crocks as are loose to dislodge themselves from the old ball. Next, throw in another layer of the turfy lumps all round the ball, and on these strew a couple of inches of the mixed compost in a mellow state; then, with a blunt stick, give the whole a slight pressure all round the ball, add another layer of the turfy lumps, strewing a little of the compost over them; again press with the stick; and now place a final coating of the compost, nearly two inches in depth, all over, and level with the rim of the pot. Let there

be no tapping or thumping the bottom of the pot on the bench. If the balls of the pines about to be shifted are dry, water them, at least three days before they are to be shifted, with tepid manure-water, in order to allow the moisture to equalize itself, and the surplus to pass away. Thus there will be no occasion for any root-watering for nearly a month afterwards. The plants may be plunged immediately they are shifted; but let them by no means be more than half their depth in the tan. If any disrooting has become really necessary, and the sun shines bright, a little canvas shading will be a benefit for a couple of hours each day; not, however, to obstruct light, but rather to prevent the too rapid dispersion of atmospheric moisture.

Stove.—For the construction of this, see **Hothouse and Pit.**

Table of Temperature as to Artificial Heat only.

	Day.	Night.	Rise in Sunshine.
January	64 deg.	60 deg.	6 deg.
February	66 "	60 "	6 "
March	70 "	62 "	6 "
April	74 "	64 "	8 "
May	76 "	65 "	10 "
June	78 "	66 "	10 "
July	80 "	68 "	10 "
August	80 "	68 "	10 "
September	76 "	68 "	10 "
October	73 "	62 "	8 "
November	70 "	62 "	8 "
December	64 "	60 "	6 "

Tables of this kind must not be allowed to guide the thermometer entirely. A good cultivator will take notice of the condition of his plants, and shape his course accordingly. If they appear "drawn," he should at once lower his night heat, as also that on dull days.

For *bottom-heat*, by adding 5° to every one of the above artificial day temperatures, we shall be as correct as by any tedious detail. Thus July and August should have a bottom-heat of 85°, which ought never to be exceeded in pine culture. If bottom-heat is supplied by a tank or pipes heated by hot water, the directions about renewing the tan are not needed.

Monthly Culture.—The plants being all plunged in the new pit, trial sticks must be put in, and a bottom-heat thermometer by all means employed. The bottom-heat here given is meant to apply to the heat at the bottom of the pot. Whilst practitioners are driven to capricious fermenting materials as a source of bottom-heat, an excess of heat will sometimes become necessary *inside the bed*, in order to provide somewhat

against sudden declines. Let, then, the operator secure the bottom-heat as per table at the bottom of the pot, and all will be right.

If the heat rises above the desired point, let water be instantly employed as a cooler between the pots; and if this does not immediately check it sufficiently, let the pots forthwith be rocked to and fro in the bed, until a fair cavity is obtained between the tan and the pot side; and when the heat has declined to the desired degree the cavity may be filled up again.

Let atmospheric moisture be liberally employed, especially from three o'clock in the afternoon until eight or nine the next morning. A slight syringing may be applied on every afternoon about closing time, taking care that at this time (*February*) it is dispersed on the following morning by a liberal heat and a free ventilation. Air must be given daily, if only for an hour; during all moderate weather a little may be given about 8 A.M.; increased, if necessary, about 11 A.M.; and taken entirely away about 3 P.M.

March.—The sun will now be gaining much power, and evaporation will be more rapid; let, therefore, a corresponding increase take place in the amount of atmospheric moisture. Shading may be employed for a couple of hours or so in the middle of very sunny days with some benefit. Syringing the surface of the tan is an excellent plan. If the wind is very cutting, be very cautious in the admission of air; the front sashes may be kept closed, and, if sunny, the shade applied, merely letting a little of the surplus heat escape at back.

April.—In proportion to rapidity of growth must be the admission of air. With a little freedom in growth, accompanied by a free perspiration, the plants will begin to require occasional waterings; indeed, the Queen section will have required it before March was out. With regard to such as the Black Jamaica, the case is widely different; it is astonishing how long these pines will not only subsist but thrive without water. Queens, Envilles, Providences, etc., will require it thrice to their once, especially the Queens.

May.—Atmospheric moisture must continue to increase with increasing heat and light. The syringe may now be applied two or three times a week, always choosing bright afternoons for its application. The closing up, or reducing the air, must now be deferred until four o'clock P.M., and the giving of air must

take place proportionately sooner; indeed, such ought to be in April. If the pines are vigorous, and plenty of atmospheric moisture can be commanded, discontinue shading at the end of April or beginning of May, unless the roof be of an exceedingly bright character, and the squares of glass very large. Rather let atmospheric moisture increase accompanied by a freer ventilation.

June.—If the pines have done well, their pots will be filled with fine roots by the end of June, and shifting into the fruiting-pots will become necessary. We will, however, pass on to the next month.

July.—At whatever period the last shifting occurs, the same routine of potting may be observed. We have nothing new to say, except that as the size of the pot increases, so may in proportion the size of the lumps of turf, etc. The plunging medium, if necessary, may be renewed; but much caution must be exercised at this period, when the solar heat produces so much excitement. However, we advise that a foot or so of new tan be trenched into the bottom of the bed, and a little mixed with surface tan, and this merely to promote durability through the ensuing winter. Watch *daily* the bottom-heat thermometer. As before observed, if the plants require a watering, let it be three days before the operation of shifting.

August.—After the plants have been shifted a fortnight or so, they will again require the water-pot. Until the plants are beginning to root in the new soil, however, they may be kept moist enough, by copious syringings, damping also the surface of the tan daily. All that is further necessary is a most liberal ventilation from eight A.M. until past four P.M., applying all the atmospheric moisture possible the moment the house is closed, and syringing just previous to closing.

September.—The August advice will do perfectly well for this month, except that ventilation may even be more liberal still, when the weather is fine, to put a check on too rampant growth; for, in order to have fine "shows," the tissue of the plant must become highly solidified.

October.—The light will now begin to decrease considerably, and both artificial heat and atmospheric moisture must give way in a proportionate degree. Still, however, persist in permitting a considerable increase of heat when the weather is bright. We need hardly say, beware of burning at the root. The advice applies to every month alike;

but it requires a double amount of watchfulness for three weeks after disturbing the fermenting material.

November.—In proportion to the dulness of this month, the heat and moisture must decline. The tan-bed will require some renewal in the early part of this month, in order to go well through the winter; and if the tan is mellow, or somewhat dry, let it be well watered with tepid water, and then stirred deeply with a pointed stake, as deep as the stake can go. The whole may then be cased over, up to, and rather above, the rim of the pot, provided the bottom-heat has declined sufficiently to bear it. This renewal must be watched, and water applied to the tan if necessary.

December and January require a very similar course of practice; much fire-heat will at times be necessary, and all possible means must be taken to counteract dryness in the atmosphere. Syringing can seldom be permitted in these two months, but sprinklings on the surface of the tan, and once a week it may be stirred up with a stake. Besides this, the floor may be kept moist, evaporating pans kept in continual requisition, and even the walks sprinkled, if necessary. If the weather become unusually severe, rather give up five degrees on the thermometer than continue a roasting fire for several days. In emergencies of this kind, the pines will take no harm at 55°; but not a degree below this should be permitted.

February.—The temperature will now begin to rise again slightly; growth recommences, and repotting succession pines, and the renewal of bottom-heat is needed, this brings us to the point from which we commenced.

Insects.—See **Acarus** and **Coccus**.

Pine-bud moth, or Pine-bud Tortrix. This pretty little moth is a member of the group **Tortricina**, and bears the name of **Retinia turionana** (syn., *Orthotænia turionana*). In its larval stage it does considerable damage to the Spruce and other Fir trees by destroying the terminal buds, and thereby preventing the proper growth and development of the tree. The eggs are deposited upon the outside of the buds in July; they hatch in about two weeks, and the young larvæ immediately commence to eat their way into the interior of the buds, which they soon destroy, and eat their way downward through the pith to the next buds below, which they then attack and kill. About the end of October the larva is to be found

in the centre of the middle bud of a shoot, where it passes the winter. It is of a shining purplish-brown colour, with a transverse black spot on the first segment behind the head. During the winter it lies dormant, commencing to feed again the next spring. In June it is full fed; it then passes to the bottom of its burrow, and there changes to a brown chrysalis. About the middle of July the perfect moth emerges. It measures from half an inch to three-quarters of an inch in expanse; the colour is tawny-orange, with numerous

silvery white markings. Where this insect has commenced its depredations, the only possible means of eradicating it is by hand-picking the attacked buds and destroying the larvæ. This is best done in the month of June, before the moth makes its appearance, so as to prevent a further brood. The buds that are attacked may easily be identified by their drooping and withered appearance; and if this process of hand-picking be followed up for a few years, the insect may be nearly eradicated, or at least its numbers will be so decreased that it will do comparative little injury.

Pineaster Beetle. *Bo'strichus.*

Pine'llia. (Commemorative. Nat. ord., *Araceæ.*)

Hardy, tuberous herb. Division in winter.

P. tuberosa. Japan.

Pingu'cula. Butterwort. (From *pinguis*, fat; the greasiness of the leaves. Nat. ord., *Lentibularineæ.*)

Seeds and divisions; chiefly requiring marshy, boggy soil. North American species are the most tender, requiring the treatment generally given to alpinæ, with the addition of keeping water in the saucer below the pot in which they are grown.

Pink. So little do the Pink, Picotee, and Carnation differ in their botanical characteristics, that they are all considered varieties of the Clove Pink (*Dianthus caryophyllus*). Some think that the Red Pinks only are derived from this, but that the Pheasant's-eye Pinks are the offspring of the Feathered Pink (*Dianthus plumarius*). As florists' flowers they are very distinct. The *Carnation* marks in flakes, or ribbons, of colour, from centre to edge, and through the edge; and the more dense these ribbons, or stripes, or flakes of colour are, and the more distinct the white ground between them, the better, and the more equally divided, as to quantity, they are, the better. As the petals are broader as they approach the outer edge, as also are, or should be, both the colour and the white. They are divided into classes, called *Bizarres* and *Flakes*; the former having two colours of stripe besides the white, the latter only one colour. These *Bizarres* and *Flakes* are subdivided, there being purple flakes, rose flakes, and scarlet flakes; and among the *bizarres*, scarlet *bizarres*, which have scarlet stripes, and a second colour, which is considered better for a rich contrast of black, and approaches to it; then purple *bizarres*, which have purple stripes, with a light pink, or rose, or some other colour, forming a contrast. The *Picotee* has the colour only on the edge, and broad or narrow, as the case may be, but ramifying towards the centre; any mark or spirt of colour that does not touch the edge is a blemish. Some, therefore, are only marked round the edge very distinctly, but as narrow as possible; others have a sort of feathering, narrow or deep, as the case may be, but feathering inwards from the edge; the outer edge solid, and the inner edge rough, or feathery. The *Pink* is distinct from both these. The lacing, as it were, of a pink is rough outside and inside, with a portion of white outside the lacing,

as if a band of colour had been laid on ; besides this, there is colour at the base of every petal, and, perhaps, one-third of the distance along the petal, so that it forms an eye, or centre, of colour, which is peculiar to itself, and which never occurs in the Carnation or Picotee. A Pink, without its lacing all round each petal, and its narrow strip of white outside it, would be worthless as a show-flower. The more distinct this lacing is, the better ; it should look like an even piece of embroidery, just fairly within the outer edge of the white.

The Pink may be propagated and cultivated in every respect similarly to the Carnation. *Pipings* of it are best made at the end of May, or early in June.

Growing in Beds.—By the middle of August Pinks are all gone out of flower. The old plants are of little use to the florist, as they seldom produce the second year first-rate bloom ; but for ornamenting the border they are valuable. Remove them out of the bed ; trim off all dead flower-stems ; and plant them in the borders of the garden rather deeper than they have been before. They will make fresh roots higher up the stems, and form close compact bushes, producing the next season abundance of flowers. If it is intended to grow Pinks again in the same bed, the soil ought to be taken out a foot deep, and renewed with fresh loam and very rotten stable-dung, in the proportion of three of the first to one of the latter, turning it over frequently to thoroughly mix and sweeten it. This should be done by the third week of August. Raise the bed six inches above the soil around, and formed like a pitched roof. The compost should be at least a foot deep. Plant in rows, the first week in September, and twelve inches apart each way. Sheltering in winter, frequent stirring of the soil in spring, and mulching with short, well-decayed stable manure early in June, are the chief points of after-culture. See **Carnation** for other points requiring attention.

Pin Pillar. *Opu'ntia Curassavica*.

Pinnate. A leaf is pinnate when several leaflets grow from the sides of one foot-stalk, as in the Pea, Acacia, etc.

Pinnatifid is when a leaf is cut across from the edge towards the centre nerve into several oblong parallel segments, as in *Ipomopsis*, etc.

Pinus. Pine-tree. (A name from Theophrastus. Nat. ord., *Coniferae* ; Tribe, *Abietinae*.)

Hardy evergreens, except where otherwise mentioned. Chiefly by seeds ; scarce ones by cuttings, layers, inarching, and grafting ; deep, rich loam yields the quickest and finest timber for bulk ; a more mountainous situation, where the soil is neither so rich nor so deep, is supposed to yield the most lasting timber.

 — *Tsu'ga*.
 — *na'na*.

Pionandra. (Nat. ord., *Solanaceae*.)
 A synonym of *Cyphomandra*.

- P. fragrans*. See *Cyphomandra betacea*.

Pionea forficata. The Garden Pebble Moth. This is sometimes found amongst cabbages, and other Cruciferae, but does little damage. The moths, which appear in May and August, are of a dull straw colour, with markings of a pale brown. The larvæ are yellowish-green, with a darker line down the back and a pale one on each side. Hand-picking is the best remedy.

Piophilæ A'pii. The Celery-stem Fly. The larvæ of this fly are found in stems of celery. The flies are glossy black, with a mixture of golden-grey and yellow veins. Infected plants should be burnt.

Pip, in floriculture, is a single corolla or flower, where several grow upon a common stem, as in the Polyanthus and Auricula. The pips thus growing together are described as a *Truss*.

Piper. Pepper. (From *pepto*, to digest; referring to the stimulating power. Nat. ord., *Piperaceæ*; Tribe, *Piperacæ*.)

Stove evergreens. Cuttings of half-ripened wood under a bell-glass, in sandy soil, in heat; also by suckers from the bottom of the plant. Winter temp., 50° to 60°; summer, 60° to 80°. The genus contains the Pepper-plant and the Betle, of which the leaf is chewed in India as much as tobacco is in the west.

P. acuminatum. Green. September. S. America. 1815. B. M. t. 1882.

— *belle*. 6. E. Ind. 1804. B. M. t. 3132.

Piperidge. The Barberry.

Pipes for heating horticultural structures are preferably made of cast iron,

painted black. Earthenware has been recommended for the purpose; but they are so much more liable to breakage and leakage, as to outweigh any original saving in the cost. For draining, earthen pipes with a bore an inch or more in diameter are the best.

TABLE of the quantity of pipe, four inches diameter, which will heat one thousand cubic feet of air per minute, any required number of degrees; the temperature of the pipe being 200° Fahrenheit.

Temp. of external air.	Temperature at which the room is required to be kept.										
	Fahr. Scale.	45°	50°	55°	60°	65°	70°	75°	80°	85°	90°

48		7	27	48	70	95	121	150	181	214	
50		19	40	62	86	112	140	171	204		
52			11	32	54	77	103	131	161	194	

To ascertain by the above table the quantity of pipe which will heat one thousand cubic feet of air per minute, find, in the first column, the temperature corresponding to that of the external air, and in one of the other columns find the temperature of the room; then, in this latter column, and on the line which corresponds with the external temperature, the required number of feet of pipe will be found.

Pipewort. *Eriocaulon*.

Piping, a mode of propagating the *Carnation*, *Picotee*, and *Pink*, is only another word for a cutting. Some persons pull off the pipings from the plant, and stick them in without more ado, but this is a slovenly way; besides, in pulling off the pipings, the main stem of the plant is materially injured, and often destroyed. The more correct way is, with a sharp knife, to cut off the side-shoot close to the stem, without injuring it, leaving a sufficient number of shoots to preserve the health of the plant. Take off one kind at once, making the proper number or tally at the same time; then

dress the pipings by cutting off the lower leaves, leaving about four at the top. These four leaves should not be mutilated or shortened, as they are the organs to send down sap to form the roots. Put the pipings in pots filled with light earth, and a covering of sand upon it. Place them in a frame with a little bottom-heat, watering gently when dry, and shade from the sun until they are rooted. See **Carnation**.

Piptade'nia. (From *pipto*, to fall, and *aden*, a gland; alluding to the falling gland of the anthers. Nat. ord., *Leguminosæ*; Tribe, *Adenanthereæ*.)

Stove shrubs. For cultivation, see ACACIA.

P. guianensis. See *Strophodendron guianense*.
— *latifolia*. 4. E. Indies. 1820.

Pipta'nthus. (From *pipto*, to fall, and *anthos*, a flower; short duration of the flowers. Nat. ord., *Leguminosæ*; Tribe, *Podalyriæ*. Allied to *Anagryris*.)

Hardy deciduous shrubs. Seeds, which ripen freely; cuttings of ripe shoots under a hand-light; layers; cuttings, also, of roots; rich, sandy loam; should have the protection of a wall in exposed, cold places, far north of London.

P. nepalensis. 10. Yellow. May. Nepal. 1821. Swt. Fl. Gard. t. 264.

— *auræa*. Yellow. 1879. Syn., *Thermopsis nepalensis*, var. *auræa*.

— *tomentosus*. Covered with silky hairs. Yunnan, China. 1887.

Piptospa'tha. (From *pipto*, to fall, and *spathe*, a sheath or spathe; the top of the spathe falls off like an extinguisher after fertilization. Nat. ord., *Araceæ*; Tribe, *Philodendree*. Allied to *Schismatoglotitis*.)

Stove herbaceous perennial, of dwarf tufted habit. Divisions and seeds. Rich sandy loam, fibry peat, and rotten leaves well drained; requires a very moist atmosphere. Summer temp., 70° to 90°; winter, 60° to 65°.

P. insignis. Spathe green and pinkish; spadix white. Summer. N. Borneo. 1879. B. M. t. 6598.

Pique'ria. (Named after A. Piqueria, a Spanish botanist. Nat. ord., *Compositæ*; Tribe, *Eupatoriaceæ*.)

Hardy herbaceous plants. Seeds, but chiefly division in spring; common soil.

P. latifolia. 1½. Purple. July. Peru. 1800. Syns., *Ageratum latifolium* and *Phalaræa celestina*.

— *trinervis*. 2. White. July. Mexico. 1798. B. M. t. 2650. Perennial.

Pirique'ta. (Probably from the native name. Nat. ord., *Turneraceæ*.) A synonym of *Turnera*.

Pironnea'va. See *Æchmea*.

Pisci'dia. Jamaica Dogwood. (From *piscis*, a fish, and *cedo*, to kill; the leaves, twigs, and bark are used to stupefy fish. Nat. ord., *Leguminosæ*. Allied to *Andira*.)

Stove evergreen, white-flowered trees, from the West Indies. Cuttings of half-ripened shoots in sand, under a glass, in heat; sandy, fibry loam. Winter temp., 48° to 60°; summer, 60° to 85°.

P. carthagine'nsis. See *P. erythrina*.

— *erythrina*. 30. White. May. W. Indies. 1890.

— *longifolia*. See *Sesbania longifolia*.

Piso'nia. (After *Willem Piso*, a physician at Amsterdam in the seventeenth century. Nat. ord., *Nyctagineæ*.)

Stove or greenhouse shrubs. Loam. Cuttings. *P. aculeata*. 10. Green. March. W. Indies. 1806. West Indian Cockspur. Stove.

— *grandis*. See *P. inermis*.

— *inermis*. 10. Green. March. Australia. 1806. Syn., *P. grandis*. Greenhouse.

— *obtusata*. 4. Green. April. W. Indies. 1824. Stove.

Pista'cia. Pistachia-tree. (Altered from its Arabic name, *Foustag*. Nat. ord., *Anacardiaceæ*; Tribe, *Anacardiæ*. Allied to *Schinus*.)

P. mutica and *lenticus* yield the useful resin called mastich. Seed nuts; layers and cuttings; rich, deep, sandy loam. Those from Barbary and the South of Europe require the protection of a greenhouse or a cold pit in winter; and even the hardest kinds, though they have stood out at Fulham and the Horticultural Society's Gardens, will generally do best against a wall, when north of London, unless the place is both sheltered from the cold and exposed to the sun.

EVERGREEN TREES.

P. lenticus. 15. May. South Europe. 1654. B. M. t. 1967.

— *angustifolia*. 10. May. South Europe. 1667.

— *Chia*. May. Scio.

DECIDUOUS TREES.

P. americana. W. Indies.

— *atlantica*. A synonym of *P. mutica*.

— *mutica*. Russia. 1844.

— *Terebinthus*. 20. June. South Europe. 1656. Sibth. Fl. Gr. t. 956.

— *sphaerocarpa*. May. Evergreen.

— *vera*. 20. May. Syria. 1770.

— *narbonensis*. 20. April. Narbonne.

— *trifolia*. 20. May. Syria. Syn., *P. officinarum*.

Pi'stia. (From *pistillum*, the female organ; signifying the appearance of the spathe inflorescence. Nat. ord., *Araceæ*; Tribe, *Arinææ*.)

Beautiful stove aquatic. Seeds and divisions; rich, strong loam; a tub or tank in the plant-stove or aquarium.

P. Stratiotes. ½. Greenish. Jamaica. 1843. B. M. t. 4564. Water Lettuce.

Pistol Plant. *Pilea muscosa*.

Pistori'nia. (Derivation not explained. Nat. ord., *Crassulaceæ*.) See **Cotyledon**.

P. hispanica. See *Cotyledon hispanica*.

Pi'sum. The Pea. (From *pis*, the Celtic name. Nat. ord., *Leguminosæ*; Tribe, *Vicææ*.)

Perennials, seeds and divisions; annuals,

seeds sown according to the time the produce is wanted; rich, deep soil, where they will neither suffer from damp nor drought. See *PEA*.

HARDY HERBACEOUS.

- P. america'num*. A synonym of *Lathyrus magelanicus*.
 — *maritimum*. A synonym of *Lathyrus maritimus*.
 HARDY ANNUALS.
P. arve'nse. Sibth. Fl. Gr. t. 687. See *P. elatum*.

 — *thebaicum*. 3. 1825.

Pit in the Stove is the excavation, or brick inclosure, in which is the tan, or other material for plunging the pots; and for *Forcing*, it is a structure having a glass roof, and differing from a hotbed and frame only in being large, and with sides fixed to the soil. (See **Hotbed** and **Melon** for examples of various kinds of Pit.) A *Cold Pit* is one where no artificial heat is used, the protection the plants receive being given solely by coverings. During summer and spring, these pits, when not covered, are still a great protection to plants by their walls. Either a Melon or Cucumber Pit unheated, or an inclosure made with turf walls, and covered with the glass lights of a hotbed frame, answer admirably as cold pits.

Pitcairnia. (Named after *Dr. Pitcairn*. Nat. ord., *Bromeliaceæ*; Tribe, *Pitcairnieæ*. Allied to *Tillandsia*.)

Stove herbaceous perennials. Division, and by suckers in spring, or when they can best be obtained; sandy, fibry peat, and good, mellow loam. Winter temp., 50° to 55°; summer, 60° to 85°.

Pithecolo'bium. (From *pithekos*, an ape, and *lobos*, the lobe of the ear; on account of the native name—Monkey's earring. Nat. ord., *Leguminosæ*; Tribe, *Ingeæ*. Allied to *Albizzia*.)

Stove trees. For cultivation, see INGA.
 — *P. pruino'sum*. White. Queensland. 1869.

Pitto'sporum. (From *pitte*, to tar or pitch, and *sporos*, seed; seeds covered with resinous pulp. Nat. ord., *Pitto-sporaceæ*.)

Greenhouse, evergreen shrubs. Cuttings of shoots in sand, under a bell-glass, in April, and kept in a close frame, without bottom-heat; sandy, fibry loam and a few nodules of fibry peat. Winter temp., 38° to 48°; summer, 60° to 75°. *P. Tobira* and *undulatum* have delightfully-scented flowers, and both have stood against walls, in the climate of London, with a little protection.

Plagioli'rion. (From *plagios*, oblique, and *leirion*, a lily; the perianth is oblique. Nat. ord., *Amaryllidaceæ*.)

Stove bulb, propagated by offsets.

P. Horsma'nni. $\frac{1}{2}$. White. June. Columbia. 1883. G. C. 1883, xx. p. 105, fig. 16.

Plagiolo'bium. (From *plagios*, transverse, and *lobos*, a pod. Nat. ord., *Leguminosæ*.) See **Hovea**.

P. chorozemae'folium. See *Hovea chorozemae'folia*.

— *ilicifo'lium*. See *Hovea ilicifolia*.

Pla'nera. (Named after *J. Planer*, a German botanist. Nat. ord., *Urticaceæ*; Tribe, *Ulmeeæ*. Allied to the Elm.)

Hardy herbaceous trees. Layers, and grafting on the elm; common, rich loam.

P. acumina'ta. See *Zelkova acuminata*.

— *aqua'tica*. 12. Brown. April. N. America. 1816. Syn., *P. Gmelini*.

— *carpini'folia*. Wats. Dendr. t. 106. See *Zelkova*.

— *Gmeli'ni*. See *P. aquatica*.

— *japo'nica*. See *Zelkova acuminata*.

— *Richa'rdi*. See *Zelkova crenata*.

Plane-tree. *Pla'tanus*.

Plane-tree, Scotch. *A'cer Pseu-do-pla'tanus*.

Planer-tree. *Pla'nera aqua'tica*.

Plank Plant. *Bossia'a scolope'n-dria*.

Planta'go. (A name used by Pliny. Nat. ord., *Plantagineæ*.)

Hardy perennials, propagated by seeds. The British species, especially *lanceola'ta* and *ma'jor* are very troublesome in lawns.

P. aqua'tica. See *Pistia stratiotes*.

— *brasili'e'nsis*. 1. Whitish. Summer. Brazil. 1823. B. M. t. 2616.

— *lanceola'ta margina'ta*. The leaves are bordered with white, and the flower spike is terminated by white spotted leaves. 1889. Increased by divisions.

Plantain. *Planta'go*. The name is also applied to some species of *Mu'sa*.

Pla'ntia. (Named by Dr. Herbert after *Mr. Plant*, nurseryman at Cheadle, in commemoration of his success in cross-breeding. Nat. ord., *Iridaceæ*; Tribe, *Moraceæ*.) Probably synonymous with **Hexaglottis**.

Greenhouse bulb. Seeds in spring, in a slight hotbed; offsets; light, rich, sandy loam; bulbs requiring to be taken up, or protected in a frame during winter.

P. fla'va. Yellow. June. Cape of Good Hope. 1842.

Planting. The end of October is the best time in the whole year to plant all kinds of trees and bushes which cast their leaves in winter, whether fruit-bearing or ornamental; but all the evergreen American plants, as the *Rhodo-de'ndron*, may be planted in October, as well as in July, August, or September—the right months for getting in most evergreens. For directions as to planting *Fruit-trees*, the reader is referred to the article **Stations**; but many of the following directions relative to planting ornamental trees and shrubs are generally applicable. Wherever they are to be placed, if the soil is at all dry at the bottom, no matter how poor it may be, it should be stirred or trenched three feet deep. In the case of single plants, where a pit or hole only is required, the narrowest diameter ought to be four feet, and if the bottom soil is poor, it should be removed, and some good added instead; but loose soil of this description will subside in time, and if the plants are tied to stakes, as many need be to keep them firm the first year or two, the sinking of the soil from under the roots may cause them to strain, or otherwise injure them, by cracking and letting in the dry winds to them. Another evil is, that when trees thus planted sink down gradually, additional soil is placed over the roots to make the surface level, and this is equivalent to planting too deep in the first instance, and deep planting is always to be avoided. Therefore the loose or new soil beneath the roots ought to be firmly pressed down, and the pit filled up to near the surface of the ground, or to within three or four inches of it, so that, when the tree or bush is planted, the surface of the pit will appear a little mound, several inches

above the surrounding surface. Plant fruit-trees shallow and on hard bottoms, to prevent their getting too luxuriant; but in gardening for ornamental plants, the more healthy and vigorous we can grow them the more ornamental they will be, unless, indeed, they are rather tender for our climate. In that case shallow planting on a solid or unloosed bottom suits them best, as they cannot grow too strong, and the wood will therefore ripen better. The shrub being taken up with long, bare roots, and a host of small fibres, and a considerable ball of soil attached close up to the bole or bottom of the plant, place this ball in the middle of the prepared pit, and fill in the loose soil under the strong roots, so that they may lie in their natural position; and in doing it, if the small fibres are pressed down too much, loosen them back again, and fill in any cavities under the bole or main roots. When the roots, great and small, each of them branching out in straight lines, are as regular as they can be placed, some of the lower ones will be out of sight, but the majority are still in view. Over those put a little better soil, thus: take a spadeful, and throw it past the stem of the plant on the roots on the opposite side to you, so that the soil runs along in the same direction as the roots. If you throw it on the roots next to you, it will run against their direction and turn back their small points, which would be nearly as bad as the old way of shaking the plant up and down at this stage. When all the roots are covered an inch or two, the watering-pot must come, with a large rose to it, and you must water all over the surface heartily, even if it is a rainy day. This watering is to do the business of the old shaking—settle the finer particles of the soil about the roots. The rest of the soil, to the depth of four or five inches, may be thrown on anyhow, if the lumps are broken small, so that the surface is pretty smooth, and formed into a shallow basin to hold the future waterings. A stout stake, or stakes, according to the size of the plant, should be driven down before the earth is put over the roots, to keep the plant from wind-waving. When large, bushy evergreens are to be removed, their branches must be tied up towards the stem by passing a rope or strong cord round them before commencing at the roots.

Flashing is a mode of repairing or modifying a hedge by bending down a portion of the shoots, cutting them half

through near the ground to render them more pliable, and twisting them among the upright stems, so as to render the whole more effective as a fence, and, at the same time, preserve all the branches alive. For this purpose, the branches to be plashed, or bent down, must not be cut more than half through, in order that a sufficient portion of sap may rise up from the root to keep alive the upper part of the branches. Where hedges are properly formed and kept, they very seldom require to be thus maimed.

Plaster of Paris. See **Gypsum**.

Platanthe'ra. (From *platys*, broad, and *anthera*, an anther. Nat. ord., *Orchideæ*; Tribe, *Ophrydeæ-Habenariæ*.) See **Habenaria**.

- P. cilia'ris.* See *Habenaria ciliaris*.

Platycar'pum. (From *platys*, broad, and *karpos*, fruit. Nat. ord., *Rubiaceæ*.)

Stove tree. Loam and leaf-mould. Cuttings of half-ripened wood, in sand, under a bell-glass.

- P. orinoce'nse.* 20. Pale rose. Spring. Orinoco. 1813.

Platycar'rya. (From *platys*, broad, and *karyon*, a nut. Nat. ord., *Juglandaceæ*.)

A shrub, or small tree, hardy in sheltered positions in the south of England. For culture, see JUGLANS.

P. strobilacea. Yellowish-green. August. North China and Japan. 1844. Rev. Hort. 1888, p. 88, figs. 18-19. Syn., *Fortunaea chinensis*.

Platyrium. Elk's-horn or Stag's-horn Fern. (From *platys*, broad, and *keras*, a horn; form of the fertile fronds. Nat. ord., *Filices*—*Polypodiaceae*.)

Stove ferns. See FERNS.

P. aethiopicum. 3. Guinea. 1822. Hook. Gard. Ferns, t. 9. Syn., *P. Stemmaria*.

Platyrium. (From *platys*, broad, and *cheilos*, a lip. Nat. ord., *Leguminosae*; Tribe, *Genisteae*.) A synonym of *Hovea*.

P. Celsiana. See *Hovea Celsii*.

Platylinis. (From *platys*, broad, and *clinis*, a couch; referring to the shape of the clinandrium. Nat. ord., *Orchideae*; Tribe, *Epidendreae-Lipariceae*.)

Stove epiphytal orchids, with small flowers. For culture, see LIPARIS.

P. Cobbiana. See *Dendrochilum Cobbianum*.

— *cucumerinum*. Light green. East Indies. 1885. Syn., *Dendrochilum cucumerinum*.

— *filiformis*. Pale yellow. Manilla. 1836.

Syns., *Dendrochilum filiforme* and *D. glumaceum* of LIL. Hort. 1878, t. 323.

— *glumacea*. White; fragrant. Philippines. Syn., *Dendrochilum glumaceum*, B. M. t. 4853.

Platydon. (From *platys*, broad, and *kodon*, a bell; form of flower. Nat. ord., *Campanulaceae*.)

Hardy herbaceous perennials. Seeds and divisions in spring, and cuttings of young shoots in summer, under a hand-light; sandy, mellow loam.

P. autumnale. See *P. chinense*.

— *chinense*. 3. Blue. June. China. 1846.

Paxt. Fl. Gard. ii. p. 61. Syn., *P. autumnalis*.

— *grandiflorum*. 1. Blue. June. Dahuria. 1782. Syn., *Campanula grandiflora*, B. M. t. 252.

— *alba*. 1. White. June. North of China. 1845.

— *alba semipleina*. 1. White. June. China. 1845.

— *Marie-sii*. A plant of more dwarf habit than the type, but with larger flowers. 1881. Garden, March, 1885.

— *sinese*. Lem. Jard. Fl. t. 250. A synonym of *Campanula sinense*.

Platy crater. (From *platys*, broad, and *krater*, a bowl; in allusion to the expanded calyx of the barren flowers. Nat. ord., *Saxifragaceae*; Tribe, *Hydrangeae*.)

Hardy shrub. Allied to *PHILADELPHUS*, to which refer for cultivation.

P. arguta. Whitish. Japan.

Platylobium. Flat Pea. (From *platys*, broad, and *lobos*, a pod. Nat. ord., *Leguminosae*; Tribe, *Genisteae*. Allied to *Hovea*.)

Greenhouse evergreens, from Australia and Tasmania. Orange-flowered, except where otherwise mentioned. Seeds in spring, in a slight hotbed, after placing them several hours in water, at a temp. of 130°; also by cuttings of the half-ripened shoots in sand, under a bell-glass, in April; fibry, sandy peat chiefly, with a very little fibry loam, charcoal, and broken potsherds, with pots extra well drained. Stagnant water, especially in winter, destroys them. Winter temp., 40° to 48°.

P. formosum. 4. July. Australia. 1790. B. M. t. 469.

— *Murrayanum*. 1. Yellow, red. May. Tasmania. 1832. B. M. t. 3259.

— *sagittata*. 3. June. S. Amer. 1826.

— *ternifolia*. 1½. Mexico. 1840.

Platylophus. (From *platys*, broad, and *lophos*, a crest; seed-pod compressed so as to seem winged. Nat. ord., *Saxifragaceae*; Tribe, *Cunoniaceae*. Allied to *Weinmannia*.)

Greenhouse evergreen tree. Cuttings of ripe shoots in sand, under a glass, in April or May; loam and peat. Winter temp., 40° to 45°.

P. trifoliata. A synonym of *Weinmannia trifoliata*.

Platypetalum. (From *platys*, broad, and *petalum*, a petal. Nat. ord., *Cruciferae*; Tribe, *Camelineae*.) A synonym of **Braya**.

Hardy herbaceous perennial. Seeds and divisions in spring; sandy peat, in a very sheltered border, but better still treated as an Alpine herbaceous plant, by giving it rather a shady place in summer, and protecting it from wet and cold in winter.

P. purpura-scens. †. Purplish. May. Melbourne Island. 1827. Now known as *Braya purpurascens*.

Platystachys. (From *platys*, broad, and *stachys*, a spike. Nat. ord., *Bromeliaceae*; Tribe, *Tillandsiæ*.) See **Tillandsia**.

Platystemon. (From *platys*, broad, and *stemon*, a stamen. Nat. ord., *Papaveraceae*; Tribe, *Romneyæ*. Allied to *Platystigma*.)

Hardy, yellow-flowered annuals. Seeds in April; common, rich, light soil.

P. californicum. 1. August. California. 1833. B. M. t. 3579.

— *leiocarpum.* 1. July. N. California. 1837. B. M. t. 3750.

Platystigma. (From *platys*, broad, and *stigma*, the female organ. Nat. ord., *Papaveraceae*; Tribe, *Romneyæ*. Allied to *Platystemon*.)

Half-hardy herbaceous perennial. Seeds and divisions in spring; common, light soil; requires a little protection in winter.

P. lineare. †. Yellow. California. 1833. B. R. t. 1954.

Platytheca. (From *platys*, broad, and *theca*, a cell; the anther-cells are broad. Nat. ord., *Tremandreae*.)

Greenhouse shrub, with the habit of a heath. For culture, see **TETRATHECA**.

P. galioides. 1. Blue. June. S. W. Australia. Syn., *Tetratheca verticillata*. Paxt. Mag. xiii. p. 171.

Pleasure-ground is a collective name for that combination of parterres, lawns, shrubberies, ornamental waters, arbours, etc., which are noticed individually in these pages. One observation may be applied to all—let harmony preside over the whole. It is a great fault to have any one of those portions of the pleasure-ground in excess; and let the whole be proportionate to the residence. It is quite as objectionable to be over-gardened as to be over-housed.

Plectocomia. (From *plektos*, plaited, and *kome*, leaves; probably from the leaves being used in plaiting. Nat. ord., *Palmeæ*; Tribe, *Lepidocarpeæ*.)

Stove palm. Seed. Sandy loam. Summer temp., 60° to 80°; winter, 50° to 55°.

P. Andersoni. India. 1874.

— *assamica.* 80. Yellow. Assam. 1841.

— *elongata.* Java. 1869.

— *himalayana.* Himalayas. 1878.

Plectranthus. (From *plektron*, a cock's spur, and *anthos*, a flower. Nat. ord., *Labiatae*; Tribe, *Ocimoideæ*.)

Herbaceous perennials, by seeds and divisions; shrubs, at times by seeds, but chiefly by cuttings in sand, under a bell-glass; rich, sandy soil will suit them all. Temperature that of the greenhouse and stove.

P. asper. See *Coleus barbatus*.

— *australis.* 3. Pale purple. Summer. Australia. B. C. t. 1185.

— *barbatus.* Andr. Rep. t. 594. See *Coleus barbatus*.

1836. Syn., *Betckea major*.

— *samoifolia.* 1. Rose. July. Chili. 1835

Syn., *Betckea samoifolia*.

Plectronia. (From *plektron*, a cock's spur; the tree armed with large spines. Nat. ord., *Rubiaceae*; Tribe, *Vanguerieae*. Allied to *Vangueria*.)

Greenhouse evergreen tree. Cuttings in sand, under a bell-glass, in May, and placed in a cold frame; sandy peat and fibry loam. Winter temp., 40° to 48°.

P. corymbosa. 20. White, green. Cape of Good Hope. 1816.

Plei'one. See **Cœlogyne**.

Pleione'ma is a garden corruption of **Pleroma**, which see.

Pleocne'mia. See **Nephrodium**.

Pleope'ltis. (From *pleos*, full, and *pelte*, a shield; referring to the covering of the spore or seed-cases. Nat. ord., *Filices*—*Polyodiaceae*.) Now regarded as a section of **Polypodium**.

Stove ferns, chiefly with brown spores. See **FERNS**.

Plerandra. (From *pleres*, full, and *aner*, a male; stamens many. Nat. ord., *Araliaceae*. Syns., *Bakeria* (of Seemann) and *Nesopanax*.)

Stove trees. Sand, loam and leaf-mould. Cuttings in sand, under a bell-glass, in heat.

- P. Græffei*. An error for *P. Grayi*.
P. Grayi. Green. Fiji. 1887.
P. vitiensis. Green. Fiji. 1887. Syns., *Bakeria vitiensis* and *Nesopanax vitiensis*.

Pleroma. (From *pleroma*, fulness; in allusion to the cells of the seed-vessel. Nat. ord., *Melastomaceae*; Tribe, *Osbeckieae*. Allied to *Osbeckia*. Syns., *Lasiandra* and *Tibouchina*.)

Stove Brazilian evergreen shrubs, chiefly with purple flowers. Cuttings of half-ripened, or rather, the short, stubby side-shoots in sand, under a bell-glass, in summer, and plunged in a little bottom-heat, lifting the edge of the bell-glass at night, to prevent damping; sandy, fibry peat, with a few nodules of fibry loam, and pieces of broken pots and charcoal, to keep the soil open, and particularly well-drained. Winter temp., 48° to 55°; summer, 60° to 85°. *Elegans* and several others do best in an intermediate house, not so hot as a stove. It does better in the greenhouse than in the stove.

Pleurogramma. (From *pleuron*, a side, and *gramma*, writing; disposition of the spore or seed-cases. Nat. ord., *Filices* — *Polypodiaceae*.) Now united with **Monogramme**.

- Stove fern. See FERNES.
P. linearis. Brown. June. Jamaica. 1823.

Pleurogyne. (From *pleuron*, a side, and *gyne*, the female organ; the stigmas issue from the side of the seed-vessel. Nat. ord., *Gentianeae*; Tribe, *Swertieae*. Allied to *Gentiana*.)

- Hardy annual. Seeds in April; chalky loam, and a small portion of peat.
P. carinthica. ¾. Blue. August. Siberia. 1827. Syn., *P. rotata*.
 — *rotata*. See *P. carinthica*.

Pleurope'talum. (From *pleuron*, a side, and *petalon*, a petal; referring to the shape of the corolla. Nat. ord., *Portulacaceae*.)

Stove shrub. Rich sandy loam mixed with a little peat or leaf-mould. Cuttings in bottom-heat under a bell-glass.

- P. costaricensis*. Green to scarlet. August. Central America. 1883. B. M. t. 6674. Syn., *Melanocarpum Sprucei*.

Pleurospe'rmum. (From *pleuron*, a side, and *sperma*, seed; the fruit has large ridges on its sides. Nat. ord., *Umbelliferae*.)

- Hardy perennial. Common garden-soil. Seeds; divisions.
P. austriacum. 3. White. Summer. South Europe. 1597.

Pleurotha'llis. (From *pleuron*, a side, and *thallo*, to bloom. Nat. ord.,

Orchideæ; Tribe, *Epidendrea-Pleurothalleæ*. Allied to *Masdevallia*.)

Steve orchids, not possessing much beauty, but are interesting, curious little plants. They thrive best upon blocks of wood, with a small portion of moss tied to the block. The best form of the block is a round one, with the top cut sloping at an angle of 45°, the plant to be fixed on the sloping part. These blocks can then be placed on the lower end, which should be cut horizontally, to allow them to stand firmly in that position.

- P. apthosa*. Yellow. January. Mexico. 1839.

Plocama. (From *plokamos*, bent hairs. Nat. ord., *Rubiaceæ*.)

Greenhouse shrub, with slender, pendent branches. Mixture of loam and peat. Cuttings in sand under a bell-glass.

- P. pedicula*. 2. White. Canary Islands. 1772.

Plocoglossis. (From *plokos*, a fold, and *glotta*, a tongue; in allusion to a fold in the lip. Nat. ord., *Orchideæ*; Tribe, *Vandee-Cyrtopodieæ*.)

Stove epiphyte. For cultivation, see CYRTOPODIUM, to which it is allied.

- P. Lowii*. Ochre, brown. Borneo. 1865.

Plocostemma. (From *plokos*, curled, and *stemma*, a crown; referring to the crown of the stamens. Nat. ord.,

Asclepiadaceæ; Tribe, *Marsdeniææ*.) See **Hoya**.

P. lasianthum. B. M. t. 5081. See *Hoya lasiantha*.

Ploughman's Spikenard. *Baccharis*.

Plum. *Prunus domestica* or *insittia*.

Superior kinds:—1. Smith's Orleans; 2. Greengage; 3. Précoce de Tours; 4. Washington; 5. White Magnum Bonum; 6. Impératrice; 7. Denistoun's Superb; 8. Golden Drop; 9. Early Favourite; 10. Ickworth Impératrice; 11. Cox's Late Red; 12. Jefferson's; 13. Reine Claude-Violette; 14. Royal Hâtive; 15. Wine Sour. Of these, Nos. 1, 3, and 9 are remarkable for their earliness as table fruit. Nos. 6, 7, 10, 11, 12, 13, for lateness as table fruit. Nos. 4, 7, 12, 15 are adapted for the kitchen. Others that require special mention are: Cooper's Large; Early Rivers; Guthrie's Late Green; Red Magnum Bonum; The Czar; Victoria, etc.

Propagation: by Grafting.—The grafting of the Plum is performed in precisely the same manner as the Pear or the Apple, and at a similar period. The Brussels stock is principally used by our nurserymen; but for such gross sorts as the Washington, the Magnum Bonum, etc., it is a question whether the Mussel stock would not be better. We need not enlarge here on the process, which will be found in detail under the head **Grafting**.

Budding.—The same may be said of this process. See **Budding**.

Seed.—This is resorted to in order to procure new varieties; and to accomplish this, of course, seed from choice varieties is obtained. The mode of sowing, rearing, etc., will be found detailed in the articles **Peach** and **Pear**.

Culture during the Growing Period.—As with the Peach, the Nectarine, Pear, etc., so with the Plum. The first proceeding of the season is disbudding. About the beginning of May the trees burst forth into a great amount of spray, and much of this will be ill-placed; and, indeed, if well-placed, much too crowded. We are, of course, speaking of wall or espalier trees, for there the most attention is requisite. A progressive disbudding is best, the first consisting in merely removing the foreright and back shoots, unless, as observed with regard to the other stone fruits, vacant spaces occur, when an ill-placed shoot is better than none. Shortly after this period, if the trees be strong, gross shoots or robbers will show themselves, which, when

about six inches long, should have the points pinched off by way of balancing. In a few weeks more, another disbudding will be expedient, and by this time shoots of a proper character for final reservation may be determined on. The latter may be carefully tied or trained as soon as convenient, and every shoot of a doubtful character, in the thinning out, may have the point pinched off. The rest of the proceedings, indeed, are so similar to the *Peach*, that it is scarcely necessary to repeat them.

Culture during the Rest Period.—The trees will require some pruning, and this consists principally in thinning out, and reducing the snags or stumps of shoots pinched back in the summer previous. Our practice is to tie down on the old wood, or otherwise train in, as much of the shoot-jointed wood as possible, without cramming it too thick; for most of this wood will become studded with blossom-spurs in the succeeding summer. All that is not needed may be cut clear away, as in the Pear; and all useless stumps also. Where wood is wanting to furnish blanks, some of the leading shoots may be shortened back a little; and, indeed, any points may be shortened which appear spongy and immature. The trees may now be carefully trained or nailed in, and, if necessary, receive any dressing requisite for the insects.

Diseases and Insects.—See **Peach**.

Plumba'go. Leadwort. (From *plumbum*, lead, or a disease of the eye so called, to which a species of *Plumba'go* was applied. Nat. ord., *Plumbaginaceæ*.)

Division of hardy herbaceous perennials, and also seeds and cuttings; cuttings of the tender kinds; the side, stubby shoots do best, but shoots at almost every age and size will strike freely in sand, under a bell-glass, in summer, and either kept cool, or with a little bottom-heat, according to the species. The tender species require the greenhouse or the stove. Sandy loam, and a little fibry peat and dried leaf-mould.

GREENHOUSE EVERGREENS.

- P. cœrulea*. 1½. Blue. Summer. South Amer. 1826. Syn., *P. rhomboidea* of B. M. t. 2917. Annual.
- *capensis*. 1½. Blue. November. Cape of Good Hope. 1818. B. M. t. 2110.

Plum, Ginger-bread. *Parinarium macrophyllum*.

Plum, Maiden. *Comocladia*.

Plum-Nutmegs. The fruits of *Monimiaceæ*.

Poa. (From *poa*, an ancient Greek name for grass or fodder. Nat. ord., *Gramineæ*; Tribe, *Festuceæ*.)

A large genus of grasses, which forms one of the chief elements of pasturage. The few species in cultivation are hardy, and may be increased by seeds or divisions.

- P. flabellata*. Falkland Islands, etc. Syns., *Dactylis cæspitosa* and *Festuca flabellata*.
 — *palustris*. 3. Purplish. South Europe. Syn., *P. fertilis*.

- P. trivialis a'bo-vittata*. $\frac{1}{2}$. England. 1868. Fl. Ser. t. 1695.

Podalyria. (A classical name. *Podalirius* was the son of *Æsculapinus*. Nat. ord., *Leguminosæ*; Tribe, *Podalyriacæ*. Allied to *Brachysema*.)

Greenhouse evergreen shrubs, from South Africa. The following, with two exceptions, are purple-flowered. Seeds in a hotbed, in spring; cuttings of stubby side-shoots in sand, under a bell-glass, in April or May; sandy loam and fibry peat, well-drained. Winter temp., 40° to 48°
P. alba. B. M. t. 1177. See *Baptisia alba*.

- *argentea*. 6. White, red. April. 1789. Salis. Parad. t. 7. Syn., *P. biflora*. B. M. t. 753.
 — *biflora*. See *P. argentea*.

 — *styracifolia*. See *P. calyptrota*.
 — *tinctoria*. B. M. t. 1099. See *Baptisia tinctoria*.

Podanthes. (From *pous*, *podos*, a food, and *anthos*, a flower; the flowers are borne on long stalks. Nat. ord., *Asclepiadaceæ*.)

Leafless, fleshy, stove shrubs. For culture, see STAPELIA.

- P. geminata*. B. M. t. 1326. See *Piaranthus geminatus*.
 — *irrorata*. Sulphur, blood-red, purple. Autumn. "South Africa. 1795. Syn., *Stapelia irrorata*. B. C. t. 127.
 — *puhura*. Green, sulphur, dark-brown. 1800.
 — *verrucosa*. Pale yellow, dark purple. Syn., *Stapelia verrucosa*. B. M. t. 786.

Podanthus. (From *pous*, *podos*, a foot, and *anthos*, a flower; referring to the flowers being stalked. Nat. ord., *Compositæ*; Tribe, *Helianthoideæ*. Syn., *Euzenia*.)

Greenhouse shrubs. Cuttings in sand under a bell-glass.

- P. Mitiqui*. 3. Yellow. Chili. 1824.
 — *ovatifolius*. 2. Yellow. Chili. 1828. Syn., *Euzenia grata*.

Podocarpus. (From *pous*, a foot, and *karpos*, a fruit; long footstalks. Nat. ord., *Coniferæ*; Tribe, *Podocarpeæ*. Allied to the Yew.)

Evergreen cone-bearers. Cuttings of ripe shoots in sand, under a bell-glass; loam and peat. Winter temp., 40° to 48°. *P. nerifolia*, *latifolia*, *spinulosa*, and *nucifera* have stood some time against walls in the climate of London. They are all good things for a winter garden.

- P. andina*. 50. Valdivia. 1860. Syn., *Prumnopitys elegans*.
 — *antarctica*. Patagonia.
 — *Bidwilli*. See *P. Totara*.
 — *chiliana*. 40. Chili.
 — *chinensis*. 20. China and Japan. 1838. Syn., *P. Maki*. There is also a variegated form.
 — *coriacea*. 50. Jamaica. Richard, Commentatio de Coniferis, t. 1, fig. 3. *Cephalotaxus drupacea* is sometimes grown under this name.

- P. dacrydioides*. 200. New Zealand.
 — *elongata*. Cape of Good Hope.
 — *Endlicheriana*. Nepal.
 — *ensifolia*. Tasmania.
 — *ferruginæa*. 80. New Zealand.
 — *japonica*. Japan.
 — *koraiæna*. A synonym of *Cephalotaxus pedunculata*, var. *fastigiata*.
 — *latifolia*. 200. March. Pandua. 1828. Syn., *P. zamiaefolia* of gardens.
 — *macrophylla*. See *P. nerifolia*.
 — *Nageia*. 60. China and Japan. Sieb. Fl. Jap. t. 135. Syn., *Nageia japonica*.
 — *nerifolia*. Java. B. M. t. 4655. Syn., *P. macrophylla*.
 — *nubiæna*. Chili.
 — *nucifera*. See *Torreya nucifera*.
 — *Purdieana*. 100. Jamaica. Yacca-wood Tree.
 — *spinulosa*. 20. Australia. Illawarra Pine.
 — *taxifolia*. 40. Peru. 1820.
 — *Totara*. 60. New Zealand. Syn., *P. Bidwillii*. Totara Pine.
 — *variegatus*. Leaves white-striped. Japan.
 — *vitensis*. 60. Leaves bright green. Fiji. G. C. 1886, xxv. p. 464, fig. 89.
 — *yaeca*, of London's Hortus Britannicus, p. 388, is *P. coriacea*; of Sweet's Hortus Britannicus, ed. 3, p. 622, is *P. taxifolia*.

Podocytisus. (From *pous*, *podos*, a foot, and *Cytisus*. Nat. ord., *Leguminosæ*; Tribe, *Genistecæ*.) A synonym of **Laburnum**.

P. caramanicus. See *Laburnum caramanicum*.

Podola'sia. (From *pous*, *podos*, a foot, and *Lasia*; differing from *Lasia* in having the spadix with a long stalk. Nat. ord., *Aroideæ*; Tribe, *Orontieæ*.)
 Stove perennial aroid.

P. stipitata. 1½. Spathe brownish-red or purple. Borneo. 1882.

Podolepis. (From *pous*, a foot, and *lepis*, a scale; flower-stalks, scaly. Nat. ord., *Compositæ*; Tribe, *Inuloidæ*. Allied to *Helichrysum*.)

P. acuminata and *P. aristata* are hardy annuals; *P. gracilis* is a half-hardy perennial. Seeds in a little heat, in spring; division in spring, as growth commences; sandy loam, and a little leaf-mould or peat; the protection of a cold pit in winter. There are several species besides the following:

- P. acuminata*. 1½. Yellow. Summer. Australia. Syns., *P. rugata* and *Scalia jaceoides*, B. M. t. 956.
 — *aristata*. 1. Golden-yellow, pink. Summer. Australia. Syn., *P. chrysantha*.
 — *chrysantha*. See *P. aristata*.
 — *gracilis*. 3. Pink. August. N. S. Wales. 1826. B. M. t. 2904.
 — *Lessonii*. Yellow. King George's Sound. 1862. Syn., *Panætia Lessonii*.

Podolobium. (From *pous*, a foot, and *lobos*, a pod; the seed-pod on a foot-stalk within the calyx. Nat. ord., *Leguminosæ*; Tribe, *Podalyriæ*. Allied to *Gompholobium*.) A synonym of **Oxylobium**.

- P. berberifolium*. See *Oxylobium berberifolium*.
 — *heterophyllum*. See *Oxylobium heterophyllum*.
 — *scandens*. See *Oxylobium scandens*.
 — *staurophyllum*. B. R. t. 959. See *Oxylobium staurophyllum*.

P. trilobatum. B. R. t. 1333. See *Oxylobium trilobatum*.

Podophyllum. Duck's-foot. (Contracted from *anapodophyllum*, or duck's-foot-leaved. Nat. ord., *Berberideæ*; Tribe, *Berberæ*.)

Hardy herbaceous perennials. Division at the root; moist, marshy peat, and a shady situation.

P. diphyllum. A synonym of *Jeffersonia diphylla*.

- *Emodi*. White. May. California. 1845.
 — *pellatum*. ½. White. May. N. Amer. 1864. B. M. t. 1819. May Apple.
 — *pleianthum*. 1-2. Rich purple. China. G. C. 1889, vi. p. 299, fig. 44.

Podopteris. (From *pous*, a foot, and *pteris*, a wing; the mode of growth. Nat. ord., *Polygonaceæ*; Tribe, *Triplurideæ*.)

Greenhouse evergreen. Cuttings of half-ripened shoots under a glass, in sandy loam, in April; sandy, fibry loam, and a little peat. Winter temp., 40° to 48°.

P. mexicana. 2. Pink. July. Mexico. 1825.

Podoria. (Derivation uncertain. Nat. ord., *Capparideæ*.) A synonym of **Boscia**.

P. senegalensis. See *Boscia senegalensis*.

Podosperma. (From *pous*, *podos*, a foot, and *sperma*, seed. Nat. ord., *Compositæ*.) A synonym of **Podothea**.

Podospermum. (From *pous*, a foot, and *sperma*, a seed. Nat. ord., *Compositæ*; Tribe, *Cichoraceæ*.) A synonym of **Scorzonera**.

P. calcitrapifolium. See *Scorzonera calcitrapifolia*.

- *canum*. See *Scorzonera Jaquiniana*.
 — *coronopifolium*. See *Scorzonera resedæfolia*.
 — *intermedium*. See *Scorzonera intermedia*.
 — *lacinia tum*. See *Scorzonera lacinia*.
 — *octangulare*. See *Scorzonera octangulatis*.
 — *pumilum*. See *Scorzonera pumila*.
 — *resedæfolium*. See *Scorzonera resedæfolia*.
 — *taraxacifolium*. See *Scorzonera taraxacifolia*.

Podostigma. (From *pous*, *podos*, a foot, and *stigma*; the style is elongated. Nat. ord., *Asclepiadaceæ*.)

Half-hardy, tuberous herb. For culture, see ASCLEPIAS.

P. pubescens. ½-1. Orange. July. S. United States. 1824. Syn., *Stylandra pumila*.

Podotheca. (From *pous*, *podos*, a foot, and *theca*, a capsule; the fruit is stalked. Nat. ord., *Compositæ*.)

Hardy annual. Ordinary garden-soil. Seeds. *P. gnaphalioides*. 1-1½. Yellow. June. Australia. 1841. B. M. t. 3920.

Pæcilopteris. (From *poikolos*, checkered, and *pteris*, a fern; alluding to the net-like veins. Nat. ord., *Filices* — *Polypodiaceæ*.) Sometimes united with **Acrostichum**.

Stove fern. See FERNs.

P. crispata. E. Indies.

- P. diversifolia*. Malay Archipelago.
- *flagellifera*. E. Indies. 1825.
- *punctulata*. Mauritius.
- *repanda*. Malay Archipelago.
- *scandens*. Brazil.
- *sinuosa*. Luzon.

Pædisca angustiora'na. Apricot Moth. As soon in May as one of the leaves of a Peach, Nectarine, or Apricot is seen rolled up, destroy the little caterpillar within the roll, and watch for others, because the eggs of the moth from which that caterpillar came continue to hatch for several weeks. The moth is the Narrow-winged Red Bar, *Pædisca angustiorana*. The caterpillars appear during May and June: they are about half an inch long, are pale yellowish-green, and with the head brownish-yellow. A few bristles are scattered over the body. It is a very active caterpillar, wriggling about in most varied contortions when disturbed, crawling with equal facility backwards and forwards, and letting itself down by a single thread from its mouth. It passes into the state of a brown, shining chrysalis, rolled up in the same leaves, and from this the moth comes forth in July. The moth is very small, not longer than a fourth of an inch. The fore-wings are reddish-brown, in bands of various degrees of darkness. The hind-wings are dusky. It deposits its eggs, probably, upon the branches, where they remain all the winter, and the caterpillars are most frequently found upon the Apricot.

Poet's Cassia. *Osy'ris*.

Poet's Narcissus. *Narci'ssus poeticus*.

Pogo'gyne. (From *pogon*, a beard, and *gyne*, the female organ; fringe on the style. Nat. ord., *Labiatae*; Tribe, *Satureineae*. Allied to *Melissa*.)

- Hardy annuals. Cultivated like **PODOSPERMUM**.
- P. Douglasii*. 1. Purple, dark violet. California. 1871. B. M. t. 5896.
 - *multiflora*. $\frac{1}{2}$. Pale lilac. August. California. 1836.
 - *multiflora*. See *P. Douglasii*, var. *multiflora*.
 - *nudiuscula*. 1. Bright blue. California. 1887. Gf. t. 1242.

Pogonia. (From *pogon*, a beard; alluding to the fringed lip. Nat. ord., *Orchideae*; Tribe, *Neottieae-Arethuseae*.)

Greenhouse or stove terrestrial orchids. See **ORCHIDS**.

- P. Barklyana*. 2. Green. South-east Africa. 1885.
- *debillia*. Andr. Rep. t. 212. A synonym of *Myoporum debile*.
- *discolor*. $\frac{1}{2}$. Green, white. Java. 1859.
- *Fordii*. Dull ochre, white, rose. April. Hong-Kong. 1883. Syn., *P. pulchella*, B. M. t. 6851.

- P. Gammieana*. $\frac{1}{2}$. Pale lilac; lip pale green. May. Sikkim. 1847. B. M. t. 6671.
- *glabra*. Andr. Rep. t. 283. A synonym of *Myoporum ellipticum*.
- *ophioglossoides*. $\frac{3}{4}$. Rose-pink. June. N. America. 1816. B. R. t. 148.
- *pendula*. $\frac{1}{2}$. Pink. August. N. America. 1824. B. R. t. 908. Syn., *Triphora pendula*.
- *placida*. Yellowish-green, pink. E. Indies.
- *pulchella*. See *P. Fordii*.
- *rosea*. 3-5. Greenish, pink, lilac, white. August. Guiana. 1844.

Pogonopus. (From *pogon*, a beard, and *pous*, a foot. Nat. ord., *Rubiaceae*; Tribe, *Condamineae*. Syn., *Howardia*.)

Stove shrub. To be grown in a compost of peat, loam, and leaf-mould, mixed with a little silver sand. Cuttings during early summer in sand, under a bell-glass, in heat.

- P. caracasensis*. Rose-pink. Summer. Caraccas, Venezuela. 1855. Syn., *Howardia caracasensis*, B. M. t. 5110.

Pogostemon. (From *pogon*, a beard, and *stema*, a stamen; the stamen filaments being hairy. Nat. ord., *Labiatae*; Tribe, *Satureineae*.)

Soft-wooded small shrubs. *P. Patchouli* requires a warm greenhouse, *P. plectranthoides* a stove. For cultivation, see **COLEBROOKIA**.

- P. Patchouli*. 3. White, purple. June. E. Indies. 1848.
- *plectranthoides*. 3. White. July. E. Indies. B. M. t. 3238.

Poinciana. Flower Fence. (Named after *Poinci*, once governor of the Antilles. Nat. ord., *Leguminosae*; Tribe, *Eucæsalpineae*. Allied to *Cæsalpinia*.)

Stove evergreen shrubs. Seeds in a brisk bottom-heat, in spring; cuttings of stubby young shoots in sand, under a bell-glass, in heat; rich, sandy, fibry loam. Winter temp., 50° to 60°; summer, 60° to 90°.

- P. elata*. 15. Yellow. E. Ind. 1778.
- *Gilliesii*. B. M. t. 4006. A synonym of *Cæsalpinia Gilliesii*.
- *insignis*. 15. Copper. S. Amer. 1823. A synonym of *Cæsalpinia insignis*.
- *pulcherrima*. B. M. t. 995. A synonym of *Cæsalpinia pulcherrima*.
- *regia*. Crimson. Madagascar. 1828. B. M. t. 2884. The pods of this are often two feet long.
- *ta'ra*. A synonym of *Coulteria tinctoria*.

Poinsettia. (Named after its discoverer, *M. Poinsette*. Nat. ord., *Euphorbiaceae*.) This genus should have been united to **Euphorbia**.

Stove Mexican evergreen shrubs. Cuttings taken off in spring, or when the old plant has done flowering; dried at the base after cutting to a joint, and after several days inserted in sandy loam, in a gentle hotbed; sandy loam, and a little peat and leaf-mould. Winter temp., 50° to 60°; summer, 60° to 85°. When done flowering, they may be kept dry, in a temperature of from 40° to 45°, if not above a period of two or three months.

- P. pulcherrima*. 4. Scarlet. March. 1834. B. M. t. 3493. Now known as *Euphorbia pulcherrima*.
- *albida*. 4. White. December. 1834.
- *major*. Larger. 1881.

Pointing-in is mixing manure with the top inch or two of the soil by means of the point of a spade or fork. This is done when roots, which ought not to be disturbed, are near the surface.

Poire'tia. (After *M. J. L. M. Poiret*, a French writer in the eighteenth century. Nat. ord., *Leguminosæ*; Tribe, *Genistææ*.) See **Hovea**.

P. elliptica. A synonym of *Hovea Celsi*.
— *linearis.* A synonym of *Hovea linearis*.

Poison-Bulb. *Brunsvi'gia cora'nica* and *toxica'ria*, and *Cr'num asia'ticum*.

Poison - Nut. *Stry'chnos nux-vo'mica*.

Poison-Oak. *Rhu's toxicode'ndron*.

Poison - Sumach, or **Poison-wood.** *Rhu's venena'ta*.

Poisonous Plants. Gardeners should be much more careful than they usually are in handling the plants they cultivate, for many of them have deadly qualities. *M. Neumann*, chief gardener of the Paris Jardin des Plantes, says that pruning-knives and hands washed in a tank after they have been employed upon some of the exotics will destroy the fish it contains. *Hippo'mane biglandulo'sa*, the *Manchineel*, the *Tanghin*, *Sa'pium lau'ro ce'rasus*, and *Comocla'dia denta'ta*, are equally deleterious to man. Gardeners who have merely rubbed the leaves of the latter between their fingers have had swollen bodies and temporary blindness. Wounds from pruning-knives smeared with the juices of such plants are like those from poisoned arrows.

Poisons. Soils containing obnoxious ingredients are certain introducers of disease and premature death. An excess of oxide of iron, as when the roots of the apple and pear get into an iron-red gravelly subsoil, always causes canker. In the neighbourhood of copper-smelting furnaces, not only are cattle subjected to swollen joints and other unusual diseases, causing decrepitude and death, but the plants also around are subject to sudden visitations, to irregular growths, and to unwarned destruction; and a crop once vigorous will suddenly wither as if swept over by a blast. There is no doubt of this arising from the salts of copper, which impregnate the soil irregularly, as the winds may have borne them sublimed from the furnaces, and the experiments of *Sennebier* have shown that of all salts those of copper are the most fatal to plants. That they can be poisoned, and by many of those substances, nar-

cotic as well as corrosive, which are fatal to animals, has been shown by the experiments of *M. F. Marcet* and others.

The metallic poisons being absorbed, are conveyed to the different parts of the plant, and alter or destroy its tissue. The vegetable poisons, such as opium, strychnia, prussic acid, belladonna, alcohol, and oxalic acid, which act fatally upon the nervous system of animals, also cause the death of plants.

The poisonous substance is absorbed into the plant's system, and proves injurious when merely applied to its branches or stem, almost as much as if placed in contact with the roots. Ulcerations and canker are exasperated if lime be put upon the wounds, and when *Dr. Hales* made a Golden Rennet Apple tree absorb a quart of camphorated spirits of wine through one of its branches, one-half of the tree was destroyed.

Poitæ'a. (After *M. Poiteau*, a French botanist. Nat. ord., *Leguminosæ*.)

Stove shrub. Well-drained sandy loam. Cuttings in sand, in heat, under a bell-glass.

P. galegoi'des. 1. Rosy-purple. June. St. Domingo. 1826.

Poi'vrea. (Named after *N. Poivre*, a Frenchman. Nat. ord., *Combretaceæ*.) A synonym of **Combretum**.

P. Afze'lii. See *Combretum grandiflorum*.

— *alternifolia.* See *Combretum decandrum*.

— *barba'ta.* See *Combretum barbatum*.

— *coccinea.* See *Combretum coccineum* and *C. purpureum*.

— *comosa.* See *Combretum comosum*.

— *deca'nara.* See *Combretum decandrum*.

— *interme'dia.* See *Combretum comosum* and *C. intermedium*.

— *macrophy'lla.* See *Combretum latifolium*.

— *pilo'sa.* See *Combretum pilosum*.

Poke Weed. *Phytola'cca*.

Polani'sia. (From *poly*, many, and *anisos*, unequal; many stamens of unequal lengths. Nat. ord., *Capparidaceæ*; Tribe, *Cleomeæ*. Allied to *Cleome*.)

Hardy annuals, flowering in June. Seeds in a slight hotbed, under a glass frame, in March and April, and pricked out and finally placed in the open ground in the beginning of June.

P. Cheladonii. 1½. Rose. E. Ind. 1792.

— *dodeca'nara.* 1½. White. E. Ind. 1795.

Syn., *Cleome Burmanni*.

— *grave'olens.* 1½. Pinkish. Canada.

— *uniglandulo'sa.* 1. White, red. Mexico. 1823.

— *visco'sa.* 2. Yellow. E. Ind. 1730.

— *icosa'nara.* 1½. Yellow. Ceylon. 1730.

Polemium. Greek Valerian. (From *polemos*, war; according to *Pliny*, a dispute about its discovery led to warfare. Nat. ord., *Polemoniaceæ*.)

Hardy herbaceous perennials. Seeds; but generally division of the plant; common garden-soil.

- P. cœruleum*. 2. Blue. June. Britain.
 — *album*. 2. White. June. Britain.
 — *dissectum*. 2. White. June. Siberia.
 1800. Syn., *P. sibiricum*.
 — *grandiflorum*. Brown. June. India.
 Biennial.
 — *himalayanum*. Lilac-blue. Himalayas.

Polianthes. Tuberose. (From *polis*, a city, and *anthos*, a flower; referring to its general use in city decoration. Nat. ord., *Amaryllidæ*; Tribe, *Agaveæ*.)

Greenhouse bulbs. Offset bulbs; old bulbs are generally obtained from Italy every year, and are planted in rich, sandy loam; and when growth has fairly commenced, they get the advantage of a slight hotbed to forward them (but the bulb, and not the top, should be kept warm), before getting them ready for rooms or greenhouses.

 Brazil. 1822. Syn., *P. gracilis*.

Pollen occurs in all flowers containing male organs. It generally exists in the form of separate grains, most frequently of a yellow or yellowish-green colour, but varying from reddish-brown in some Lilies to blue in Scilla. These grains are the result of repeated divisions of certain cells in the anther; those by whose immediate division the pollen grains are formed are known as *parent cells*. Each parent cell produces four grains, each of which contains protoplasmic matter termed *fovilla*, and is surrounded by two coats, the *extine* and the *intine*. When applied to the stigma

of a flower the intine bursts through the extine in the form of a tube, and penetrates the style until it comes in contact with the ovule, which it fertilizes. The shape of the grain varies much, but as four are generally formed from a more or less spherical mother cell, it is usually a three-sided pyramid with a convex base. The extine may be smooth, granular, warted, or spiny. In some cases the grains remain attached together in waxy club-shaped masses, e.g. certain *Orchidæ* and *Asclepiadææ*. In some *Conifereæ* the grain has two bladder-like appendages, containing air, to render it more capable of being dispersed by the wind.

Pollia. (After *Van der Poll*, once a consul in Holland. Nat. ord., *Comelinaceæ*.)

Stove herbaceous, trailing perennial. Sandy loam and leaf-mould. Seeds; divisions.
P. crispata. Blue. Australia. 1822. Syn., *Anilema crispata*.

Pollination. The act of applying pollen to the stigma of a plant. In a state of nature this is done by the agency of wind or insects, or sometimes by the direct application of the pollen to the stigma of the same flower (self-fertilization). Under cultivation the gardener employs it to raise new hybrids.

Poly, or Germander. *Teucrium*.

Polyachyrus. (From *poly*, many, and *achuron*, chaff. Nat. ord., *Compositæ*; Tribe, *Mutisiaceæ*.)

Half-hardy herbaceous perennial. Division and cuttings of the young shoots in spring, in sandy soil; the protection of a cold frame, or some analogous place, in winter.

P. Poeppigii. Blue. June. Chili. 1830.

Polyalthia. (From *polys*, much, and *althecis*, healthy; the plants were supposed to maintain health. Nat. ord., *Anonaceæ*.)

Stove trees. Rich sandy, fibry loam. Cuttings of half-ripened shoots in April, in sand, under a bell-glass, in a brisk bottom-heat.

- P. cerasodes*. 60. Green. East Indies. 1820.
 Syn., *Guatteria cerasodes*.
 — *suberosa*. 30. White. East Indies. 1820.
 Syn., *Guatteria suberosa*.

Polyanthus. A race of Primulas derived from a cross between the Primrose and the Cowslip. There are many varieties, and their excellence as florists' flowers may be determined by the following rules:

The Pip.—1. This should be perfectly flat and round, slightly scalloped on the edge, and three-quarters of an inch in diameter.

2. It should be divided in (five or) six places, apparently forming (five or) six

flower-leaves, each indented in the centre to make it a kind of heart-shaped end ; but the indentations must not reach the yellow eye.

3. The *indenture* in the centre of the apparent flower-leaves should be exactly the same depth as the indenture formed by the join of these flower-leaves, so that it should not be known, by the form of the flower, which is the actual division and which is the indenture ; in other words, which is the side and which the centre of the flower-leaf ; and all the indentures should be as slight as possible, to preserve the character.

4. The flower should be divided thus : the *yellow tube* in the centre being measured, the *yellow eye*, round the tube, should be the same width as its diameter ; and the *ground colour* of the flower should be the same width ; or draw with the compasses, opened to a sixteenth of an inch apart, a circle for the tube or centre, open them to three-sixteenths, and draw another circle for the eye, then open them further to five-sixteenths, and draw a third circle for the ground or dark colour. Beyond these circles there is a *yellow lacing*, which should reach round every flower-leaf to the yellow eye, and down the centre of every petal to the eye, and so much like the edging that the flower should appear to have (ten or) twelve similar petals. The ends of these (ten or) twelve should be blunted, and rounded like so many semicircles, so that the outline of the circle should be interrupted as little as possible.

5. The *tube* (one-fifth the width of the whole flower) should be nearly filled up with the six anthers, which are technically called the *thrum* (have an elevated edge, rendering it *trumpet-eyed*), and the flower should not exhibit the pistil.

6. The *edging* round and down the centre of the petals formed by the divisions should be of even width all the way, and uniformly of the same shade of sulphur, lemon, or yellow as the eye, and there must not be two shades of yellow in the eye.

7. The *ground colour* may be just what anybody likes best, but clear, well-defined, perfectly smooth at the edges inside next the eye, so as to form a circle, and outside, next the lacing. A black or a crimson ground, being scarce, is desirable ; but the quality of the colour as to clearness, rather than the colour itself, constitutes the property.

The *Plant*.—1. The *stem* should be strong, straight, elastic, and from four to six inches in length.

2. The *footstalks* of the flower should be of such length as to bring all the flowers well together.

3. The *truss* should rise from the centre of the foliage, comprise seven or more flowers, and be neatly arranged to be seen all at once.

4. The *foliage* should be dark green, short, broad, thick, and cover the pot well ; but erect and clustering round, though lower than the truss.

The *Pair, or Collection*.—The *pair*, or pan of more, should comprise flowers of different and distinct colours, either the ground colour or the yellow of each being sufficiently different from the rest to be well distinguished. The whole should be so near of a height as to range the heads of bloom well together. The great fault of the Polyanthus now, even among the best sorts, is that the divisions between the petals are so wide as to make the flower look starry, whereas there should be no more gap where the division is than is in the indentation of the petal itself.—GLENNY'S *Properties of Flowers, etc.*

Culture.—The Polyanthus is much easier to cultivate than the Auricula.

Polybo'trya. (From *poly*, many, and *botrys*, a bunch ; alluding to the fructification. Nat. ord., *Filices*—*Poly-podiaceae*.) This is sometimes united with **Aerostichum**.

Stove ferns. See FERNS.

- *muscifera*. 1. Pale brown. Early Spring. Columbia. 1849. Syn., *Cycnoches muscifera*.
- *vittata*. 1. Yellow, dark chocolate. British Guiana. 1841. Syn., *Houlletia vittata*. B. R. 1841, t. 69.

Polygala. Milkwort. (From *poly*, much, and *gala*, milk; abundance of milky juice. Nat. ord., *Polygalacæe.*)

Annuals, by seed in a peaty border; herbaceous perennials, seeds and divisions in similar soil, or sandy loam and leaf-mould; hardy shrubs and under-shrubs, as *chamæbrus*, by cuttings and suckers, and which species, in particular, likes a little chalk with the peat and leaf-mould; tender shrubs, by cuttings of the side-shoots, when 2½ inches long, taken off close to the stem, and inserted in sand, under a bell-glass; for all these, peat three parts, and loam one part. Many of them, from their beauty and comparative hardness, should be tried against conservatory walls, such as *latifolia*, *myrtifolia*, *grandiflora*, *speciosa*, etc.

Polygonum. (From *poly*, many, and *gonu*, a knee; numerous joints of the stem. Nat. ord., *Polygonaceæ*; Tribe, *Eupolygoneæ*.)

Annuals, seeds in the open border, in March and April; herbaceous perennials, also by seeds, as for annuals, and division of the roots; tender annuals require the assistance of a hotbed before transplanting in May; greenhouse shrubs, by cuttings in sandy soil, under a glass, and grown in fibry loam, with a little peat; several of them, such as *adpressum*, which sends out very long shoots, should be tried against a wall. The fruit of several, such as *tataricum* are used for tarts.

Polygonia. (One of the Muses. Nat. ord., *Compositæ*; Tribe, *Helianthoideæ*.)

Greenhouse or hardy perennials. *P. pyramidalis* is best propagated by seed, which should be raised in a hotbed, and then transplanted where the plants can have plenty of room. It is a very rapid grower, attaining a height of six to eight feet the first year, and flowering the second

year. Rich loam, leaf-mould, and manure. Summer temp., 70° to 85°; winter, 60° to 70°.

P. canadensis. 6. Pale yellow. July. N. America. 1768.

— *edulis*. Yellow. Cultivated in the Andes. The tubers are edible.

— *grandis*. } See *Montanoa bipinnatifida*.

— *heracleifolia*. } See *Montanoa bipinnatifida*.

Polypo'dium. Polypody. (From *voly*, many, and *pous*, a foot; numerous feet-like divisions of the creeping stems. Nat. ord., *Filices*—*Polypodiaceae*.)

A large genus of ferns, distributed throughout the world. Attempts have been made by many authors to split it up into smaller genera, characterized by the arrangement of the veins in the frond. Amongst these genera are:—AGLAOMORPHA, CAMPYLONEURON, COLYSIS, CRASPEDARIA, CRYPTOSORUS, CYRTOMIPHLEBIUM, DIBLEMMA, DICTYMYIA, DICTYOPTERIS, DRYNARIA, DRYOSTACHYUM, GONIOPHLEBIUM, GONIOPTERIS, GRAMMITIS (partly), LECANOPTERIS, LEPICYSTIS, LOPHOLEPIS, MICROGRAMME, MICROSORIUM (partly), NIPHOBOLUS, NIPHOPSIS, PARAGRAMMA, PHEGOPTERIS, PHLEBODIUM, PHYMATODES, PLEPELTIS, PLEURIDIUM, etc. Most of the species in cultivation require stove treatment. See FERNES.

P. acrostichoides. 2. Ceylon. Syn., *Niphobolus acrostichoides*. Greenhouse.

- *multi'fido-crista'tum*. †. Much forked and crested.
- *omnilo'cerum*. Pinnae deeply lobed, but not overlapping.
- *pulche'rriimum*. 1. A broad, deeply serrate variety.
- *semila'cerum*. 1. Bipinnatifid below, pinnate above. Ireland.
- *serra'tum*. Margins serrate.
- *suprasori'ferum*. Sori on the edges of the upper surface.
- *varia'bile*. Much divided.
- *crista'tum*. Densely crested. Also known as *glomeratum*.
- *variega'tum*. Fronds variegated with whitish-yellow.
- *virginia'num*.
- *Wildeno'vii*. See *P. propinquum*.
- *Xi'phias*. 1. South Pacific Islands. Syn., *Pleopeltis Xiphias*.

Polypody. *Polypo'dium*.

Polyporus. A genus of Fungi containing many species found growing upon the stems of old trees. Some of them attain a diameter of two feet, and becoming woody in age, are occasionally dried and used as brackets. The under surface is densely perforated with pores, which are lined with minute spores or reproductive bodies. The appearance of these fungi is a sure sign of an unhealthy state of the timber of the tree.

Poly'scias. (From *poly*, much, and *skias*, shade; the leaves afford abundant shade. Nat. ord., *Araliaceae*.)

Stove trees. For culture, see *TREVESIA*.

- P. cutisp'ngia*. Mauritius. Syn., *Gastonia cutispongia*.
- *panicula'ta*. Madagascar. 1866. Syn., *Terminalia elegans* of gardens.

Polyspo'ra. (From *poly*, many, and *spora*, seed; many-seeded capsules. Nat. ord., *Ternströmiaceae*; Tribe, *Gordoniae*.) See *Gordonia*.

- P. axillaris*. B. M. t. 4019. See *Gordonia anomala*.

Polysta'chya. (From *poly*, many, and *stachys*, a spike; referring to the inflorescence. Nat. ord., *Orchideae*; Tribe, *Vandæo-Cymbidiæe*.)

Stove, epiphytal orchids. For culture, see *ORCHIDS*.

- P. abbrevia'ta*. Brazil. 1874.

Polyxe'na. (After *Polyxena*, the daughter of Priam. Nat. ord., *Liliaceae*; Tribe, *Alliæ*.)

South African bulbs. For culture, see MASONIA.

- P. odora'ta*. ¾. White. October. South Africa. 1871. Syn., *Massonia odorata*. B. M. t. 5891.
 — *pygmaea*. ½. Lilac. April. South Africa. 1790. Syn., *Massonia ensifolia*, B. M. t. 554, *M. uniflora* and *M. violacea*.

Pomade'rris. (From *poma*, a lid, and *derris*, a skin; the membranous covering of the seed vessel. Nat. ord., *Rhamnaceae*; Tribe, *Rhamneae*.)

Greenhouse, Australian, evergreen shrubs; yellow-flowered, except where otherwise stated. Cuttings of half-ripened shoots cut to a joint, dried at the base, and inserted in sand, under a glass; peat and sandy loam. Winter temp., 38° to 45°. *Elliptica*, with the exception of having creamy-like flowers, resembles the *Ceanothus azureus*, and no doubt would prove almost as hardy against a wall.

- P. acuminata*. See *P. discolor*.
 — *andromedae'folia*. See *P. phillyreoides*.
 — *apetala*. 4. Greenish. June. 1803. Syn., *P. aspera*. Victorian Hazel.

 — *Wendlandia'na*. }

Poma'ria. (Named after *Pomar*, a Spanish physician. Nat. ord., *Leguminosae*; Tribe, *Cæsalpinieae*. Allied to *Cæsalpinia*.)

Greenhouse evergreen shrub. Seeds in a hotbed, in spring; cuttings of half-ripened shoots in May, in sand, under a bell-glass; sandy loam and fibry peat. Winter temp., 40° to 48°.

- P. glandulos*. 6. Yellow. May. New Spain. 1826. Syn., *Cæsalpinia glandulosa*.

Po'max. (From *poma*, a lid; the operculum, or covering of the seed-vessel. Nat. ord., *Rubiaceae*; Tribe, *Anthospermeae*. Allied to *Opercularia*.)

- Greenhouse evergreen. See OPERCULARIA.
P. hirta. 1. White, green. July. Australia. 1826.

Pomegranate. *Pu'nica*.

Pompion. *Cucu'rbita*.

Poncele'tia. (Named after *M. Poncelet*, author of a treatise on Wheat. Nat. ord., *Epacridaceae*; Tribe, *Epacreae*.) See **Sprengelia**.

- P. sprengelii'des*. See *Sprengelia Ponceletia*.

Ponds are reservoirs for water dug

out of the soil, and made retentive by puddling with clay their bottoms and sides. Puddling is necessary in almost all instances, and the mode of proceeding is thus detailed by Mr. Marnock, in the "United Gardeners' Journal." When the excavation is formed, or partially so, the bottom puddle near the outer edge is formed, and upon this is raised the upright or side puddle; and as this proceeds, the ordinary clay or earth is raised at the same time, by which means the upright puddle is retained in its place; and ultimately the sides, being formed in a sloping direction, admit of being covered with gravel or sand, and may be walked upon, or stakes may be driven to a considerable depth without reaching the puddle, or in any way injuring it. This can never be the case if the puddle, as is sometimes done, be laid upon the sloping side of the pond. The sides may slope rapidly, or the reverse. If the slope be considerable, sand or gravel, to give a clean appearance, will be more likely to be retained upon the facing; plants can be more easily fixed and cultivated; goldfish, also find in these shallow, gravelly parts under the leaves of the plants suitable places to deposit their spawn, and without this they are seldom found to breed. Ponds made in this way be of any convenient size, from a couple of yards upwards to as many acres. The following is the section of a pond thus formed :

a indicates the surface of the ground at the edge of the water; *b*, the puddle; *c*, the facing to preserve the puddle from injury; *d*, the water; *e*, the surface of the latter; and *f*, the ordinary bottom. When a small pond of this kind is to be made, and the extent of the surface is determined upon and marked out, it will then be necessary to form a second or outer mark, indicating the space required for the wall or side puddle, and about three feet is the proper space to allow for this; the puddle requiring about two feet, and the facing which requires to be laid upon the puddle ought to be about a foot more, making together three feet. Ponds may be made very ornamental.

Pon'tia. A genus of butterflies, also known as *Pieris*, of which the following one is most obnoxious to the gardener:

P. brassicæ (Large White Cabbage Butterfly). The wings are white; the upper with broad black tips; and the female has two black spots on the middle. The under side of the under wings is light yellow. Breadth, when expanded, two inches. It appears from May to October. The caterpillar is bluish-green, thinly haired, and

sprinkled with black dots, having a yellow stripe on the back, and the same on the sides. These caterpillars are found, throughout the summer and autumn, on all the cabbage-worts, on horse-radish, radishes, mustard, and similar plants, as well as on water-cresses. The pupæ are yellowish-green, with black dots, with a point on the head, and five on the back. The best way to destroy them is picking off and killing the caterpillars, as well as the pupæ, as far as it is possible; the latter are found attached to adjacent trees, hedges, and walls. But care must be taken not to destroy those pupæ which have a brown appearance; because they are full of the larvæ of ichneumons, and other allied parasites, which are the great scourge of these caterpillars.

P. ra'pæ (Small Cabbage Butterfly). This butterfly resembles the foregoing, but is one-half smaller; and the black tinge at the points of the upper wings is fainter, and not visible on the outer edge. The time of appearance is the same as of the former. The caterpillar is of a dull green, with fine white minute hairs, a yellow stripe on the back, and yellow spots on the sides, on a pale ground. In some years it is very injurious to the cabbage and turnip plants; it also infests mignonette, which it strips entirely of its leaves. It is very difficult to be discovered, from its colour. The pupa is yellowish or greenish-grey, with three yellow stripes.—*Kollar*.

Potato. *Sola'num tubero'sum*.

Soil.—A dry, friable, fresh, and moderately rich soil is the best for every variety of the potato.

The black-skinned and rough-red thrive better than any other in moist, strong, cold soils. If manure is absolutely necessary, whatever may be the one employed, it is better spread regularly over the surface previous to digging than put into the holes with the sets, or spread in the trench when they are so planted; but, if possible, avoid manuring. Leaf-mould, or very decayed stable-dung, is the best of all manures; seaweed is a very beneficial addition to the soil; and so is salt. Coal-ashes and sea-sand are applied with great benefit to retentive soils. The situation must always be open.

Propagation.—It is propagated in general by the tubers, through the shoots arising from thence, and layers of the stalks, may be employed. New varieties are raised from seed.

Planting in the open ground is best done in October and November, and may thence be continued until the end of March. This last month is the latest in which any considerable plantation should be made. They will succeed if planted in May, or even June; yet it ought always to be kept in mind that the earliest planted, especially in dry soils, produce the finest, healthiest, and most abundant crops.

Sets.—The next point for consideration is the preparation of the sets. Some

gardeners recommend the largest potatoes to be planted whole; others, that they be sliced into pieces containing two or three eyes; a third set, to cut the large tubers directly in half; a fourth, the employment of the shoots only, which are thrown out if potatoes are kept in a warm, damp situation; and a fifth, that merely the parings be employed. Cuttings of the stalks, five or six inches in length, or rooted suckers, will be productive if planted, during showery weather, in May or June; and during this last month, or early in July, the potato may be propagated by layers, which are formed by pegging down the young stalks when about twelve inches long, they being covered three inches thick with mould at a joint. For the main crops, moderate-sized whole or half potatoes are the best.

To obtain early crops where tubers are rapidly formed, large sets must be employed. In these one or two eyes at most should be allowed to remain. If the sets are placed with their leading buds upwards, few and very strong early stems will be produced; but, if the position is reversed, many weak and later shoots will arise, and not only the earliness but the quality of the produce be depreciated. For the earliest crops there are, likewise, several modes of assisting the forward vegetation of the sets. These should be prepared by removing every eye but one or two; and being placed in a layer in a warm room, where air and light can be freely admitted, with a covering of straw, chaff, or sand, they soon emit shoots, which must be strengthened by exposure to the air and light as much as possible, by taking off the cover without injuring them. During cold weather, and at night, it must always be removed: the leaves soon become green and tolerably hardy. In early spring they are planted out, the leaves being left just above the surface, and a covering of litter afforded every night until the danger of frost is passed.

Planting.—Insert them with the dibble, in rows; for the early crops twelve inches apart each way, and for the main ones eighteen inches; the sets six inches beneath the surface. The potato dibble is the best instrument that can be employed, the earth being afterwards raked or struck in with the spade, and the soil not trampled upon, but planted as sufficient is dug for receiving a row; for the looser the soil the less does frost penetrate, and the more readily does superfluous moisture escape.

The compartment may be laid out

level and undivided if the soil is light ; but if heavy soil is necessarily employed, it is best disposed in beds six or eight feet wide. If the staple of the soil be good throughout, the alleys may be two feet wide, and dug deep, otherwise they must be made broader, and only one spit taken out, the earth removed being employed to raise the beds, which should be in four parallel ridges, and the sets inserted along their summits.

Hoeing.—As soon as the plants are well to be distinguished, they should be perfectly freed from weeds, and of the early crops the earth drawn round each plant, so as to form a cup as a shelter from the cold winds, which are their chief enemy at that season ; but the main crops should not be earthed up, for earthing up diminishes the crop one-fourth. Throughout their growth they should be kept perfectly clear of weeds.

It is very injurious to mow off the tops of the plants. The foliage ought to be kept as uninjured as possible, unless, as sometimes occurs on fresh ground, the plants are of gigantic luxuriance, and even then the stems should be only moderately shortened. It is, however, of considerable advantage to remove the fruit-stalks and immature flowers as soon as they appear, unless the stems are very luxuriant. A potato-plant continues to form tubers until the flowers appear, after which it is employed in ripening those already formed.

The very earliest crops will be in production in June, or, perhaps, towards the end of May, and may thence be taken up as wanted until October, at the close of which month, or during November, they may be entirely dug up and stored. In storing, the best mode is to place them in layers, alternately with dry coal-ashes, earth, or sand, in a shed. The best instrument with which they can be dug up is a three-flat-pronged fork, each row being cleared regularly away.

The tubers should be sorted at the time of taking them up ; for, as the largest keep the best, they alone should be stored, whilst the smaller ones are first made use of.

Potatoes should not be stored until perfectly dry, and must also be free from earth, refuse, and wounded tubers.

To raise Varieties.—A variety of the potato is generally considered to continue about fourteen years in perfection, after which period it gradually loses its good qualities, becoming of inferior flavour and unproductive ; fresh varieties must, therefore, be occasionally raised from seed. The berries, or apples, of

the old stock, having hung in a warm room throughout the winter, the seed must be obtained from them by washing away the pulp during February. The seed is then thoroughly dried and kept until April, when it is sown in drills about a quarter of an inch deep, and six inches apart, in a rich, light soil. The plants are weeded, and earth drawn up to their stems, when an inch in height ; and as soon as the height has increased to three inches, they are moved into a similar soil, in rows sixteen inches apart each way. Being finally taken up in the course of October, they must be preserved until the following spring, to be then replanted and treated as for store crops.

The tubers of every seedling should be kept separate, as scarcely two will be of a similar habit and quality, whilst many will be comparatively worthless, and but few of particular excellence. If the seed is obtained from a red potato that flowered in the neighbourhood of a white-tubered variety, the seedlings, in all probability, will in part resemble both their parents ; but seldom or never does a seedling resemble exactly the original stock. At all events, only such should be preserved as are recommended by their superior earliness, size, flavour, or fertility.

The early varieties, if planted on little heaps of earth, with a stake in the middle, and when the plants are about four inches high, being secured to the stakes with shreds and nails, and the earth washed away from the bases of the stems by means of a strong current of water, so that the fibrous roots only enter the soil, will blossom and perfect seed.

Forcing.—The season of forcing is from the close of December to the middle of February, in a hotbed, and at the close of this last month on a warm border, with the temporary shelter of a frame. The hotbed is only required to produce a moderate heat. The earth should be six inches deep, and the sets planted in rows six or eight inches apart, as the tubers are not required to be large. The temperature ought never to sink below 65°, nor rise above 80°.

The rank steam arising from fermenting dung is undoubtedly injurious to the roots of potatoes ; and to obviate this they may be planted in narrow beds, and the dung applied in trenches on each side ; or all the earth from an old cucumber or other hotbed being removed, and an inch in depth of fresh being added, put on the sets, and cover them

with four inches of mould. At the end of five days the sides of the old dung may be cut away in an inward slanting direction, about fifteen inches from the perpendicular, and strong linings of hot dung applied.

If the tubers are desired to be brought to maturity as speedily as possible, instead of being planted in the earth of the bed, each set should be placed in a pot about six inches in diameter, though the produce in pots is smaller. But young potatoes may be obtained in the winter, by the following plan, without forcing:—Plant some late kinds, unsprouted, in a dry, rich border, in July, and again in August, in rows two feet apart. They will produce new potatoes in October, and in succession until April, if covered with leaves or straw to exclude frost. If old potatoes are placed in dry earth, in a shed during August, they will emit young tubers in December.

Preparation of Sets for Forcing.—They should be of the early varieties. To assist their forward vegetation, plant a single potato in each of the pots intended for forcing during January. Then place in the ground, and protect with litter from the frost. This renders them very excitable by heat; and, consequently, when plunged in a hotbed, they vegetate rapidly and generate tubers. The seed potatoes are equally assisted, and with less trouble, if placed in a cellar just in contact with each other; and as soon as the germs are four inches long, they are removed to the hotbed.

Management.—More than one stem should never be allowed, otherwise the tubers are small, and not more numerous.

Water must be given whenever the soil appears dry, and in quantity proportionate to the temperature of the air. Linings must be applied as the temperature declines, and air admitted as freely as the temperature of the atmosphere will allow. Coverings must be afforded with the same regard to temperature.

From six to seven weeks usually elapse between the time of planting and the fitness of the tubers for use.

The best rules to obtain and preserve sound potatoes, and a good crop, are—1. Grow none but those which ripen by August. 2. Plant whole, middle-sized potatoes. 3. Plant on moderately light soil, manured some months previously. 4. Apply no manure at the time of planting. 5. Plant in November in light, dry soils, but not until February in wet soils. 6. Preserve your seed potatoes between layers of earth until required. 7. Plant

as you dig; that is, dig enough for one row, and then plant it with the dibble, so as to avoid trampling on the ground. 8. Let the tops of the sets be six inches below the surface. 9. Do not earth up the stems. 10. Do not cut down the stems. 11. Take up the crop as soon as the leaves begin to look yellow in July or early August. 12. Store in a dry shed between layers of earth, sand, or coal-ashes.

Potato, or Colorado Beetle.
Doryophora decemlineata.

Potato Murrain, or Potato Disease. This disease—which has been more or less destructive to the potato crops since the year 1845, when it was so general as to cause great losses and much distress in some parts of the kingdom, by the almost total failure of the crops—is caused by the attacks of two kinds of fungi, named *Peronospora infestans* and *Fusisporium solani*, which spread through the tissues of the potato, corroding and causing the death and decay of every part with which they come in contact, so that in the end, if left to themselves and the weather being favourable to their growth, they bring about the death and putrefaction of the entire potato plant. The disease usually makes its appearance in July or August, sometimes earlier, and is first made evident by the appearance of brown spots upon the leaves; it generally appears soon after the first heavy summer rains, as wet weather is favourable to the development and growth of the fungi, and it is more prevalent in wet seasons than in dry ones, especially if the season be a warm one and thunder storms frequent.

That the disease is caused by fungi, has been known for many years, but it was not until 1875 and 1876 that their life-history was fully worked out, when this was successfully accomplished by Mr. W. G. Smith, and thus a firm basis secured upon which to commence a war of extermination against the disease, because the first real step towards the cure of any disease is to thoroughly understand its cause. From the life-history of *Peronospora infestans* as published by Mr. Smith in the "Gardeners' Chronicle" for 1875 and 1876, we condense the following account:

If a section be made through a badly diseased potato leaf and highly magnified, it will present somewhat the appearance shown at A in our engraving, where the thread-like jointed *mycelium* of the fungus is seen growing among the cells
